A correct calculation of the scale factor between the diffraction data of isomorphous crystals is shown on the basis of a statistics criterion. This scale factor requires no additional refinement, improves the signal-to-noise ratio of difference Patterson maps and Wilson's statistics and allows an estimation of the degree of non-isomorphism. The method has been tested for the 3 Å data sets of protein γ-crystallin crystals and a few of its heavy-atom isomorphous derivatives. (12 refs.)

118795 The effect of finite detector slit height on peak positions and shapes in powder diffraction. E.Prince (Nat. Measurement Lab., NBS, Washington, DC, USA).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.508-11 (1 Oct. 1983).
The finite height of the detector slit of a powder diffractometer has three observable effects: (1) the peak is shifted by an amount that is proportional to $-\cot 2\theta$; (2) the peak is broadened by an amount proportional to $\cot^2 2\theta$; (3) an asymmetry is introduced into the peak shape that depends on $\cot^3 2\theta$. If the underlying instrumental resolution function has a Gaussian shape, the slit height effects can be approximated, over a rather broader range of shapes for the vertical resolution function, by an Edgeworth series making use of one adjustable parameter. This peak shape function is compared with experimental observations and with other shape functions that have been proposed. A well characterized peak shape is at least as important as resolution when the data are to be used for structure refinement by the Rietveld technique and diffractometers should be designed so as to keep the slip height within the range that leads to shapes that can be described mathematically. Diffrac-

tometers with multiple detectors can usefully have different vertical divergences for detectors that cover different angular ranges. (10 refs.)

118796 A geometric method incorporated with a computer program for indexing crystal faces of microcrystallites. S.Simov (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria), E.Simova, B.Davidkov, G.Mechenov.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.559-62 (1 Oct. 1983).
A way of indexing microcrystallites is described in which analytical geometry is used. Two micrographs obtained at different tilting angles of the object are considered as the two orthogonal projections of the object on the *XOY* plane of a Cartesian coordinate system. The abscissae and the ordinates of three noncollinear points of each indexable habit face are determined by direct measurement and the *Z* coordinates are calculated. The habit faces are regarded as planes in three-dimensional space and the angle between each pair of indexable faces is calculated. The indexing is performed by comparing the calculated angles between the habit faces and the angles between the already known equilibrium planes (predicted by the theory). A computer program for experimental data processing is briefly described. (18 refs.)

118797 Development of new management system for Cambridge crystallographic database. Y.Watanabe, T.Suzuki, M.Noguchi.
Rep. Inst. Phys. & Chem. Res. (Japan), vol.59, no.4, p.138-57 (1983). In Japanese.
A new Management System for Cambridge Crystallographic Database (XCDB) is developed as an integration of two subsystems, XCDB search and retrieve system and XCDB maintenance system with the following features in its design: (1) It makes possible the high speed retrieval by direct access to XCDB file (60 MB or more) using BSAMLIB, a routine developed in this Institute for direct access to the sequential dataset with undefined length record. (2) Several simple users' commands (XCDB search/retrieve commands and input/output control commands) are provided. (12 refs.)

118798 X-ray reflection curves of crystals with randomly distributed microdefects in the Bragg case. V.Holy (Dept. of Solid State Phys., J.E. Purkyne Univ., Brno, Czechoslovakia).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.642-6 (1 Sept. 1983).
The formalism of the optical coherence has been applied to the description of the Bragg-case dynamical X-ray diffraction from crystals with randomly distributed amorphous spheres. Explicit formulas have been found for the reflection curves of such crystals in the first and second approximations of the iterative solution of the Takagi equations. It is shown that if the coherent plane wave falls on the crystal the diffracted wave consists of two parts—the plane coherent wave (which corresponds to the diffraction from a perfect crystal with a modified value of the Debye-Waller factor) and the partially coherent wave (diffusion scattering). The form of the partially coherent contribution to the reflection curve is discussed and its dependence on the defect diameter and the defect concentration. From the curves the integrated intensities are obtained. It is proved that the integrated intensity of the waves diffracted from such crystals depends linearly on the relative disturbed volume of the crystal and in the first approximation it does not depend on the defect diameter if this volume remains constant. (9 refs.)

118799 Theoretical study of the influence of the width of the entrance slit on the contrast of dislocations in X-ray topography by means of simulations. Y.Epelboin, A.Authier (Univ. Pierre et Marie Curie, Paris, France).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.767-72 (1 Sept. 1983).
Experimental topographs may be simulated by addition of simulations where one point source is lit on the surface of the crystal. The accuracy of a varying-step integration of Takagi equations is good enough to allow such computations. It is shown that all parts of the contrast are sensitive to the width of the entrance slit and that accurate characterization of defects must take this parameter into account. (15 refs.)

118800 General calculation of the polarization factor for multiple coherent scattering of unpolarized and plane-polarized X-rays. C.W.Dwiggins,Jr. (Bartlesville Energy Technol. Center, USDOE, Bartlesville, OK, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.773-7 (1 Sept. 1983).
The polarization factor for coherent scattering from a crystalline or noncrystalline sample can be calculated easily for any number of pre- and post-sample scatterers of any orientation. No complicated visualization is necessary. Either an analytical or a numerical method can be used. Simple repeated matrix multiplication is used to determine the polarization factor. The technique is illustrated for a Bonse-Hart instrument having 13 scattering processes. (16 refs.)

118801 The intensity enhancement of diffracted wave of X-rays at the rear surface. T.S.Uragami (Faculty of Sci., Okayama Univ. of Sci., Okayama, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3073-9 (Sept. 1983).
The intensity distribution of wave field in a perfect crystal of rectangular form is calculated for a very narrow incident wave by numerically solving Takagi's equations. The result is displayed by the graphics and interpreted in comparison with the analytic solutions of the partial differential equations. Most part of the incident wave propagates straight without being diffracted inside the crystal even when it satisfies the Bragg condition. Upon hitting a side face of the rectangular crystal it is shown to be reflected back inside the crystal and to interfere with the Bragg diffraction already excited in the crystal. (18 refs.)

61.10F Experimental techniques

(inc. apparatus, techniques and calculation methods for analyzing experimental results; see also 07.85 X-ray, gamma-ray instruments and techniques)

118802 Cooperative programming in crystallography. R.A.Alden, G.Bricogne, S.T.Freer, S.R.Hall, W.A.Hendrickson, P.A.Machin, R.J.Munn, A.J.Olson, G.N.Reeke,Jr., S.Sheriff, J.M.Stewart, J.Sygusch, L.F.TenEyck, K.D.Watenpaugh (Scripps Clinic & Res. Found., La Jolla, USA).
Comput. & Chem. (GB), vol.7, no.3, p.137-48 (1983).
Under the auspices of the National Resource for Computation in Chemistry a group of 14 X-ray crystallographers convened in a series of workshops to explore and exercise means of producing computer software for general use in their field that would alleviate many of the problems facing scientific programmers in an ever changing computational environment. The group has succeeded in cooperatively producing a comprehensive computer program for the solution of the multiple isomorphous replacement phasing of macromolecular crystal structures. The techniques employed allow the program to be run in virtually any scientific computing environment and are applicable to other scientific fields. The project is discussed in terms of its successes and failures. (38 refs.)

118803 Real-time X-ray topography: applications to bulk HgCdTe materials. R.G.Rosemeier (Brimrose Corp. of America, Baltimore, MD, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1656-60 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Commercially available portable image X-ray intensifiers have found their usefulness with all existing X-ray topographic techniques. Real-time X-ray topography can be employed to align the diffraction images rapidly before recording them on high resolution film. As a before recording them on high resolution film. As a quality control procedure, real-time Berg-Barrett X-ray topography can be used to assess macrostructural quality of HgCdTe with approximately 100 μm spatial resolution. As a X-ray screening technique prepared samples of HgCdTe can be assessed in real time before undergoing unnecessary costly processing on poor material. The advantages and disadvantages of the three basic types of X-ray topographic system will be discussed. The usefulness of real-time X-ray intensification as a support tool to Berg-Barrett, Lang, and ACT topography techniques is evaluated. Also, instrument characteristics of the X-ray intensifiers which are useful in real-time X-ray topography applications will be presented. (16 refs.)

118804 The experimental determination of the phases of X-ray reflections. B.Post (Phys. Dept., Polytech. Inst. of New York, New York, NY, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.711-18 (1 Sept. 1983).
The application of dynamical diffraction theory to the 'phase problem' for centric crystals shows that the intensities diffracted in simultaneous three-beam interactions display characteristic maxima and minima. The sequence in which these appear on chart recordings is a sensitive function of the phase of the triplet involved in the interaction. The sequence is the same for all triplet phases of the same sign; it is reversed for those of the opposite sign. In earlier work a number of triplet phases in perfect crystals were determined. In the present work, several hundred triplet phases in mosaic crystals have been determined. (14 refs.)

118805 Polarization ratios for repeatedly reflected X-ray beams. J.L.Lawrence (Dept. of Phys., Univ. of St. Andrews, St. Andrews, Scotland).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.753-5 (1 Sept. 1983).
The polarization ratio for a repeatedly reflected X-ray beam has been calculated, assuming the Darwin formulism, in the case where the diffracting planes of the crystals are parallel. It is shown that polarization ratios lie closer to unity than those obtained using the kinematic approximation. The integrated intensities and polarization ratios from a double-crystal spectrometer are discussed. The polarization ratio for a graphite monochromator has been measured experimentally and shown to be close to the value predicted by the Darwin theory and significantly different from the kinematic value. (8 refs.)

118806 An alternative approach to the quantitative determination of grain-size distribution in X-ray diffraction? A comment. E.F.Bertaut (Lab. de Cristallographie, Univ. Sci. et Medical Grenoble, Grenoble, France).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.818-19 (1 Sept. 1983).
The paper by Zhao, Lu and Lagally [Acta Cryst. (1982), A38, 800-802] is commented on and compared with a previous paper by Bertaut [Acta Cryst. (1950), 3, 14-18]. (8 refs.)

118807 Study of the swelling of vermiculite-ornithine in salt solution by small-angle X-ray scattering analysis. Method of interpretation and investigation of the order parameters. J.Saez-Aunon (CSIC, Grupo di Fisico-Quimica Mineral, Madrid, Spain), C.H.Pons, J.E.Iglesias, J.A.Rausell-Colom.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.439-48 (1 Oct. 1983). In French.
A method of interpretation is presented for the small-angle scattering patterns of vermiculite-ornithine gels. The method has been applied to the results obtained from a vermiculite from Malawi. The distribution of spacings between parallel first-neighbour silicate layers can be described by three order parameters, whose values are found by analysing the experimental modulation functions. The variation of these order parameters with the salt concentration of the suspension should allow one to specify the swelling process as well as the relationship between the crystal chemical properties of the silicate and its behaviour as a colloid. (20 refs.)

118808 X-ray Rietveld refinement using Debye-Scherrer geometry. P.Thompson, I.G.Wood (Clarendon Lab., Univ. of Oxford, Oxford, England).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.458-72 (1 Oct. 1983).
A procedure for Rietveld refinement from Debye-Scherrer X-ray diffraction patterns is described, in which the effects of instrumental aberrations on the peak shapes and positions are calculated and incorporated into the refinement model. These aberrations, neglected in previous Rietveld refinement programs, can produce severe systematic errors in both the structural and nonstructural parameters derived. Results presented from four materials (SiO_2, $AlPO_4$, Al_2O_3, $LiTaO_3$) are in good agreement with single-crystal values and are an improvement over those previously obtained by X-ray powder diffraction. (60 refs.)

118809 An absolute intensity standard for small-angle X-ray scattering measured with position-sensitive detectors. T.P.Russell (IBM Res. Lab., San Jose, CA, USA).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.473-8 (1 Oct. 1983).
Silica sols have been evaluated as a means of determining the incident beam intensity using position-sensitive detectors. Analysis of the total integrated small-angle X-ray scattering yielded an electron density of the suspended

silica particles that was within 4% of the electron density of amorphous silica. The sols were found to be particularly well suited for use with position-sensitive detectors and represent a convenient, rapid, and accurate means to determine the incident beam intensity. (30 refs.)

118810 A computer X-ray quantitative phase analysis. Z.Weiss, J.Krajicek (Coal Res. Inst., Ostrava-Radvanice, Czechoslovakia), L.Smrcok, J.Fiala.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.493-7 (1 Oct. 1983).
A computer-based method of X-ray quantitative phase analysis which utilizes the whole powder diffraction pattern including overlapping diffractions is described. The measured intensities are compared with those obtained from the calculations based on single-crystal investigations. Three examples are included showing the analyses of artificially prepared mixtures of quartz, micas, chlorites, carbonates and kaolinite. (17 refs.)

118811 The doping method in quantitative X-ray diffraction phase analysis. Addendum. S.Popovic, B.Grzeta-Plenkovic (Ruder Boskovic Inst., Zagreb, Yugoslavia), T.Balic-Zunic.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.505-7 (1 Oct. 1983).
A specific case of the doping method (Popovic and Grzeta-Plenkovic, 1979) is elaborated, in which the weight fraction of a crystalline component in the multicomponent system can be determined from the measurement of diffraction line intensities of that component only. Optimum conditions to attain maximum accuracy of the doping method are discussed. (3 refs.)

118812 Diffraction line profiles and Scherrer constants for materials with hexagonal crystallites. R.Vargas, D.Louer (Lab. de Cristallochimie, Univ. de Rennes I, Rennes, France), J.I.Langford.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.512-18 (1 Oct. 1983).
Diffraction line profiles and Scherrer constants for use with various measures of diffraction broadening are derived for right hexagonal prisms. A method is described for obtaining the size of crystallites with this form and a comparison is made with a cylindrical model. The technique is applied to annealed ZnO powder obtained from the thermal decomposition of $Zn_3(OH)_4(NO_3)_2$. The Fourier method is used to show that the crystallites are hexagonal prisms with an average height and edge length of 213 and 87 Å and with the z axis parallel to the axis of the prism and x or y parallel to an edge. (20 refs.)

118813 Eccentricity corrections for a modified Debye-Scherrer camera. L.K.Frevel (Dept. of Chem., Johns Hopkins Univ., Baltimore, MD, USA).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.532-4 (1 Oct. 1983).
By substituting a thin flat powder specimen for the conventional cylindrical sample in a modified Debye-Scherrer camera (Frevel et al., 1982), well defined diffraction profiles representative of the entire sample are obtained. The peak of such a diffraction profile can be measured quite accurately so that for that reflection the effective center of the diffracting sample may be determined from the bracketing diffraction peaks of an internal standard. (6 refs.)

118814 Detector aperture size in the conventional estimation of integrated intensity in the $\omega/2\theta$ scan mode. A.McL.Mathieson (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.572-3 (1 Oct. 1983).
In respect of the traditional wide-aperture procedure for the measurement of integrated intensity, the practice of varying the detector aperture width from reflection to reflection as a function of tan θ is shown to be erroneous in relation to the $\omega/2\theta$ scan mode: in most cases, no adjustment is needed at all. (7 refs.)

118815 Error in 2θ from single-crystal diffractometers due to sample absorption in a divergent primary beam. C.Svensson (Inorganic Chem., Univ. of Lund, Lund, Sweden).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.573-5 (1 Oct. 1983).
The primary-beam divergence of an X-ray four-circle diffractometer is the source of an error in the measured scattering angles from absorbing single crystals. A correction for this error is included in a least-squares program for lattice-constant determination. It is shown with α-$LiIO_3$ as an example that both accuracy and precision are enhanced. The 2θ corrections are typically as large as 0.03° for a spherical crystal with $\mu R=1.5$ and $R=0.15$ mm. The results indicate an obtainable accuracy of about 0.02% in lattice constants even if $\mu R \gtrsim 1$. (11 refs.)

118816 A computer program generating parameters useful in X-ray diffraction topography studies. K.J.Roberts (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.577-8 (1 Oct. 1983).
A simple Fortran computer program XRTDAT is described. This program generates data useful in the planning, execution and interpretation of an X-ray topographic experiment. (6 refs.)

118817 A simplified sample cooling system for X-ray diffraction experiments. Y.Yoshimura, N.Tsuda, K.Shimaoka (Dept. of Math. & Phys., Ritsumeikan Univ., Kyoto, Japan).
Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.41, p.21-6 (1982).
Low temperature sample cooling was successfully stabilized using a cold nitrogen gas system without electronically automated control. The system is useful for short time as well as long time X-ray diffraction experiments above about liquid nitrogen temperature up to about 500K. A perfect prevention from moisturing or frost condensation onto the sample can be realized in the regular air-conditioned laboratory. An insignificantly small temperature change was seen only in the case of refilling liquid nitrogen in the gas generator Dewar, the limits of temperature fluctuation being within 0.5K. The lowest temperature experiments, at 85K, were able to be carried out for about 10 hours with 3 liters per hour consumption of liquid nitrogen. (3 refs.)

118818 Manifestation of X-ray absorption in calcium hexaboride and lanthanum hexaboride. Yu.B.Paderno, I.G.Barantseva, E.M.Dudnik, L.I.Kopylova, L.V.Strashinskaya (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.119-22 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.50-4 (Feb. 1983). [received: Sept. 1983]
The effect of specimen size on the intensity of X-ray reflections was studied by comparing theoretically calculated and experimentally measured intensities of X-ray photograph lines of specimens of various diameters. It is concluded that the absorption factor must be taken into account in calculations of the X-ray line intensity of the hexaborides of rare-earth metals. In physical investigations involving analyses of the intensities of X-ray lines of materials with low coefficients μ it is necessary to employ only solid, nonporous specimens of regular geometric shape. Approximation of irregular specimen shapes with regular shapes bearing a more or less close resemblance to them cannot be recommended owing to the possibility of calculated intensities differing significantly from real ones. 61.12 NEUTRON DETERMINATION OF STRUCTURES

(for specific determinations, see 61.55 to 61.80)

118819 Theory of multilayer neutron monochromators. V.F.Sears (CAECL, Chalk River, Ontario, Canada).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.601-8 (1 Sept. 1983).
The theory of the reflecting properties of multilayer monochromators is developed on the basis of both the kinematical and the dynamical theory of neutron scattering with emphasis on the way in which the flux and polarization of the reflected beam depends on the parameters that characterize the multilayer. The effect of random variations in layer thickness is investigated using a cumulant expansion method. The contamination of the reflected beam due to both higher-order Bragg reflections and specular reflection is also discussed. (6 refs.)

118820 Assessment of parameter accuracies in profile analysis of white-beam neutron powder diffraction experiments. H.Poyry (Reactor Lab., Tech. Res. Centre of Finland, Espoo, Finland), K.J.Tilli.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.479-85 (1 Oct. 1983).
One of the problems arising in profile analyses of white-beam powder diffraction experiments is that in order to assess the reliability of the refined structure parameters allowance must be made not only for errors in the actual powder data but also for uncertainties in the various wavelength-dependent corrections involved. As a means for such assessments the authors' work provides a general method in which the incident white neutron flux spectrum is assumed to be measured and combined with the other wavelength-dependent factors to form a set of effective incident intensities with known statistical properties for the diffraction peaks. Given that appropriate models are used for both the powder spectrum and the effective fluxes, the unknown model parameters and their accuracies can be estimated optimally through a single least-squares fit of the available experimental data. By applying the formalism to a real nickel powder measurement, it was shown that the precision of the parameter estimates may depend considerably on the errors of the wavelength-dependent corrections, unless these are known with much higher accuracies than the diffraction pattern. In the example this provided true especially for the scale factor and the temperature factor. (20 refs.)

118821 A medium-resolution double-crystal diffractometer for the study of small-angle neutron scattering. J.Kulda, P.Mikula (Nuclear Phys. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.498-504 (1 Oct. 1983).
The angular resolution of the parallel (1,-1) double-crystal setting has been relaxed from the original value of 10 μrad for perfect silicon crystals into the region 0.1-1 mrad by their elastic deformation. The totally reflecting region of the dynamical diffraction curve is broadened proportionally to the deformation while the wings as well as the diffuse scattering intensity are not affected substantially. This experimentally verified fact causes gain both in intensity and the signal/noise ratio. First experiments were performed with bent Si single-crystal bars in symmetric 220 reflection geometry at $\theta_B=16.7°$. With the bending radii of the order of 100 m, an angular resolution of 0.6 mrad and an effective neutron flux at the sample position of 400 $mm^{-1}\ s^{-2}$ were achieved. These values do not depend on beam cross section. (15 refs.)

118822 Analysis of anisotropy of small-angle neutron scattering of polyethylene single crystals. D.M.Sadler (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.519-23 (1 Oct. 1983).
A method is described which provides an efficient way of analysing degrees of anisotropy in small-angle scattering. It is applied to isotopic mixtures of polyethylene crystallized from solution, and to the same system which has been annealed (heat treated). The degree of orientation of the lamellar crystallites is measured separately. The results can then be given in terms of molecular dimensions along and at right angles to the lamellar normals. It is found that each molecule is probably restricted to one lamella, and than its dimension along the lamellar normal increases on annealing. (11 refs.)

61.14 ELECTRON DETERMINATION OF STRUCTURES

(for specific determinations, see 61.55 to 61.80)

118823 Electron channeling contrast in characteristic energy-loss intensity investigated by the rocking-crystal method. M.Brunner, W.Hylla, H.-J.Kohl (IBM Thomas J. Watson Research Center, Yorktown Heights, NY, USA), H.Niedrig, D.Wendtland.
Scanning Electron Microsc. (USA), pt.1, p.99-104 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
Electron channeling patterns have been recorded using the rocking-crystal method. From thin crystals not only backscattered but also transmitted and forward scattered electrons are detected in these experiments. The mechanical rocking technique allows the recording of convergent-beam patterns (zones-axis patterns) by detecting the transmitted direct-beam intensity. Electrons with a preset energy window can be selected for signal production using a magnetic energy analyzer underneath the crystalline sample. Patterns have been obtained detecting energy filtered electrons which show the dependence of energy loss signals on the crystal orientation. (19 refs.)

61.14D Theories of diffraction and scattering

118824 The contrast of defects in inelastically scattered electrons. P.Rez (Dept. of Materials Sci., Univ. of California, Berkeley, CA, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.697-706 (1 Sept. 1983).
The theory for the contrast of stacking faults and dislocations in electrons which have been scattered inelastically is derived. Small-angle plasmon and single-electron scattering show similar contrast to the elastically scattered electrons. Phonon scattering by large angles away from strongly excited Bragg reflections shows reversed contrast and small-angle phonon scattering gives better contrast for defects near the top of the specimen. (28 refs.)

61.14F Experimental diffraction and scattering

118825 Analysis of time-dependent images of $NbSe_3$. J.W.Steeds, K.K.Fung, S.McKernan (Dept. of Phys., Univ. of Bristol, Bristol, England).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1623-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The properties of time dependent 'strands' and 'fringes' in satellite dark field electron microscope images is described and the interpretation of these features is discussed. (5 refs.)

61.16 OTHER DETERMINATION OF STRUCTURES

(for specific determinations, see 61.55 to 61.80)

118826 Geometrical aspects of thermal diffuse scattering and the associated γ-ray and X-ray Kikuchi effects near a Bragg reflexion. S.W.Wilkins, L.T.Chadderton (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia), T.F.Smith.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.792-800 (1 Sept. 1983).
Sharp dips which are observed in inelastic thermal diffuse γ-ray scattering intensities, and which move rigidly when the crystal is rotated, are attributed to a γ-ray Kikuchi effect. Some geometrical aspects of the effect are explored using the $(\Delta 2\theta, \Delta\omega)$ approach recently developed by Mathieson [Acta Cryst. (1982), A38, 378-87] for dissecting a Bragg reflexion. In particular, it is shown that observation of the effect should not be very sensitive to angular divergence of the incident γ-ray beam, but should depend on the effective source size, the angular resolution of the detector and on basic crystal properties such as size, absorption coefficient and mosaicity. Some useful general results for coordinate transformations between reciprocal space and $(\Delta 2\theta, \Delta\omega)$ space are also presented. (41 refs.)

118827 The symmetry of convergent-beam electron diffraction patterns from bicrystals. F.W.Schapink, S.K.E.Forghany (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands), B.F.Buxton.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.805-13 (1 Sept. 1983).
A discussion of the relationship between the symmetry of bicrystals and the resulting symmetry of convergent-beam electron diffraction (CBED) patterns is presented. For this purpose bicrystal symmetry is defined from the symmetry of the dichromatic pattern or complex formed by the interpenetrating lattices or structures of the individual crystals in a bicrystal. The interrelation between the possible coloured point groups and the diffraction groups, characterizing the symmetry of a CBED pattern, is established. Thee results are illustrated by a determination of the symmetry of thin twinned Au crystals from suitable CBED patterns. (21 refs.)

61.16D Electron microscopy determinations

118828 On the identification of numerical simulation of contrasts visible in crystalline interfaces. R.Bonnet (Inst. Nat. Polytech. de Grenoble, Grenoble, France).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.147-58 (1983). In French. (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
The numerical treatment of conventional transmission electron microscope images obtained from two-beam diffractions is well known since the work of Howie and Whelan (1961). However, it is the Australian team which is at the origin of the technic of computed electron micrographs (Head et al, 1973; Humble and Forwood, 1975) making it possible to reproduce visually the detailed contrasts of the boundary dislocations or the rigid body translations at boundaries. The interest, the improvements and the limits of this method are discussed in the frame of recent works involving twin and high angle boundaries. (48 refs.)

118829 Principles and applications of electron holography. K.-J.Hanssen (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Phys. Bl. (Germany), vol.39, no.8, p.283-8 (Aug. 1983). In German.
All the important processes of conventional optical holography can also be employed in electron microscopy, where they are applied to the study of electrical and magnetic structures with a resolution down to 2 mm. However, the original concept of electron holography, i.e. to improve the resolution of electron microscope photographs, has not so far been achieved. The main reason for this is the large amount of noise in the holographic reconstruction, particularly in the atomic region. This stems basically from the distribution of the grain accumulations which develop on the hologram plates during electron irradiation. It is hoped that this difficulty will be overcome when grainless or fully electronic recording processes are available. (15 refs.) *D.J.B.*

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE

(for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

118830 Excess free volume and intermolecular interaction for some binary molten metal halide mixtures. S.N.Shrivastava, J.D.Pandey (Dept. of Chem., Bipin Behari Coll., Jhansi, India).
Acoust. Lett. (GB), vol.6, no.12, p.178-81 (June 1983).
The concept of free volume has been applied to some binary molten metal halide mixtures. Bockris' relation for the free volume of molten metal salts has been extended to the evaluation of free volume in binary molten metal halide mixtures. The Eyring-Kincaid relation has also been used for the calculation of free volume for the same mixtures. The intermolecular interaction study has been made through the excess free volume for the binary molten metal halide mixtures. The results are consistent with the theories. (12 refs.)

118831 On the coupling between the double layer and the solvent polarization fields. D.Schiby, E.Ruckenstein (Dept. of Chem. Engng., State Univ. of New York, Buffalo, NY, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.277-81 (9 Sept. 1983).
An approach is developed to incorporate in the standard theory of the double layer the effect of the solvent polarization. This polarization is due to a source of polarization on the surface and to the charges in the diffuse layer. The new equations lead to the conclusion that a diffuse layer can be generated even in the absence of a surface charge as long as there is some source of polarization on the surface, such as a layer of dipoles. The solvent polarization also changes the surface potential. (9 refs.)

118832 Symposium on the Hydrophobic Interaction.
Faraday Symp. Chem. Soc. (GB), no.17 (1982). [received: Sept. 1983]
Conference held at: Reading, Berks., England. Date 15-16 Dec. 1982. The following topics were dealt with: historical perspective of hydrophobic interactions; vapour pressure measurements of solubilisation; NMR investigation of clathrates; cage model for solutions; isothermal transport in solutions; thermodynamics of cavity formation; molecular librations and solvent orientational correlations; Monte Carlo computer simulation of the hydrophobic effect; geometric relaxation; hydrophobic moments and protein structure; Kirkwood-Buff theory applications; film pressures of ionic surfactants; dilute polymer solutions; haemoglobin conformational and functional properties. 16 papers are published in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

118833 Molecular librations and solvent orientational correlations in hydrophobic phenomena. P.J.Rossky, D.A.Zichi (Dept. of Chem., Univ. of Texas, Austin, TX, USA).
Faraday Symp. Chem. Soc. (GB), no.17, p.69-78 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
A detailed analysis of the energetic characteristics associated with the solvent in a simulation of a solution containing a pair of apolar spheres immersed in ST2 water solvent is presented. The spheres are separated by a distance corresponding to the so-called solvent-separated hydrophobic interaction. The analysis of local structure is facilitated by the consideration of only near-neighbour solvent-solvent interactions and the use of a coarse-grained time-averaging procedure which removes the high-frequency librational excitation from the underlying hydrogen-bond network. The structure produced is analogous to that termed 'V-structure' by Eisenberg and Kauzmann (1969). The results manifest the expected enhancement in intermolecular interactions within the solvation shell, characteristic of higher orientational correlation, and this enhancement is markedly greater in the region which includes solvent that is shared by solute solvation shells. The V-structure obtained is consistent with an underlying network with further enhancement of intermolecular orientational correlations, upon which is superimposed thermal librational excitation. The intermolecular bonding is consistent with local energetic stabilization of the solvent-separated configuration, reinforcing the clathrate-like picture of solvation. (23 refs.)

118834 Monte Carlo computer simulation study of the hydrophobic effect—potential of mean force for $[(CH_4)_2]_{aq}$ at 25 and 50°C. G.Ravishanker, M.Mezei, D.L.Beveridge (Dept. of Chem., Hunter Coll., City Univ. of New York, New York, NY, USA).
Faraday Symp. Chem. Soc. (GB), no.17, p.79-91 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
A series of liquid state computer simulations has been performed on the system $[(CH_4)_2]_{aq}$ at 25°C as a function of the separation R between the dissolved CH_4 molecules. The potential functions for H_2O-H_2O, CH_4-H_2O and CH_4-CH_4 are based on quantum-mechanical calculations of the corresponding intermolecular interactions. The simulation was carried out by the Monte Carlo method augmented with convergence acceleration techniques involving force-bias and the method of preferential sampling. The potential of mean force $w_{ss}(R)$ for the interaction of the apolar species in water was determined using umbrella sampling procedures on four windows on the inter-solute coordinate. Convergence acceleration was found to be necessary for obtaining satisfactory results. Contact and solvent-separated contributions to the statistical state of the system are discussed in terms of the radial distribution functions, quasi-component distribution functions for coordination number, binding energy and pair interaction energies. Stereographic views of significant structures are presented, and contributions of clathrate structures in the solvent are discussed. The results are discussed in the context of the experimentally observed concentration dependence of hydrophobic effects and related theoretical work on $w_{ss}(R)$ by Marcelja, Mitchell, Ninham and Scully (1977), Pratt and Chandler (1977), and Pangali, Rao and Berne (1978). Prospects for quantitative study of the temperature dependence of the hydrophobic interaction and other quantitative extensions of the work are discussed. (26 refs.)

118835 Geometric relaxation in water: its role in hydrophobic hydration. R.Lumry, E.Battistel (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA), C.Jolicoeur.
Faraday Symp. Chem. Soc. (GB), no.17, p.93-108 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
The thermodynamic quantities $\Delta G°$, $\Delta H°$, $\Delta S°$ and $\Delta C_p°$ associated with the solvation of argon in water and aqueous mixtures are reinterpreted on the basis of two contributions. The first is related to the hydrogen-bonding connectivity of water and is assumed to be approximately represented by corresponding thermodynamic quantities in solvents such as hydrazine and ethylene glycol; following a proposal by Lumry and Frank (1978) and Lumry (1980), this contribution determines the free energy of hydrophobic hydration and is dominated by a positive enthalpy. The second contribution, which is responsible for marked enthalpy-entropy compensation and large heat-capacity effects

in argon hydration, is assigned to the characteristic fluctuation behaviour of liquid water. This assignment is substantiated by comparisons of the bulk properties of water and various other liquids, and a model is suggested to rationalize the uncommon thermodynamic properties of water, aqueous mixtures and solutions of hydrophobic solutes. The phenomenological representation proposed is an overlay of a randomly connected H-bond network and a local fluctuation process defined in terms of a minimum cooperative unit. This process, labelled 'geometric relaxation', is pictured as a cooperative H-bond rearrangement involving a water molecule coordinated by four neighbours. The limiting microstates of the cooperative units are 'short-bond' forms (with short, stiff, near-linear bonds) and 'long-bond' forms (with long, weak, bent hydrogen bonds). The first is dominated by the low enthalpy of short hydrogen bonds and the second by the high entropy resulting from motions of the water molecules on flexible hydrogen bonds into the free volume not available to the 'short-bond' form. (49 refs.)

118836 Application of the Kirkwood-Buff theory to the problem of hydrophobic interactions. A.Ben-Naim (Dept. of Phys. Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
Faraday Symp. Chem. Soc. (GB), no.17, p.121-7 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Two possible applications of the Kirkwood-Buff (KB) theory of solutions to the problem of hydrophobic interactions (HI) are presented. The first involves the inversion of the KB theory and was published some years ago. Its main result, as far as HI is concerned, is the possibility of evaluating the integral G_{ss} for solute-solute interactions using experimental thermodynamical data. The second application is based on the exact relation which may be approximately factorized into two terms, one depending on the excluded volumes of the solutes and the other depending only on properties of the solvent. This relation enables one to estimate the strength of the HI and its dependence on the temperature and pressure. A preliminary set of results is presented. (8 refs.)

118837 The application of the HNC/MSA approximation to bulk electrolytes. D.Henderson (IBM Res. Lab., San Jose, CA, USA), M.Lozada-Cassou, L.Blum.
J. Chem. Phys. (USA), vol.79, no.6, p.3055-7 (15 Sept. 1983).
The HNC/MSA integral equation, where the hypernetted chain (HNC) kernel is replaced by the mean spherical approximation (MSA) kernel, is applied to a model bulk electrolyte consisting of charged hard spheres in a uniform dielectric medium. The thermodynamic functions which result from this hybrid integral equation are better than those of the HNC equation at low concentrations and only slightly worse than those of the HNC equation at high concentrations. At low concentrations, the HNC/MSA radial distribution functions are qualitatively better than the HNC values. In particular, there is no peak in $g_{++}(r)$ near $r=2\sigma$. Quantitatively, the HNC/MSA $g_{++}(r)$ appears to be an overcorrection of the HNC $g_{++}(r)$. (7 refs.)

118838 Extensions of the molecular dynamics simulation method. II. Isothermal systems. J.M.Haile, S.Gupta (Dept. of Chem. Engng., Clemson Univ., Clemson, SC, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3067-76 (15 Sept. 1983).
For pt.I see ibid., vol.73, p.2412 (1980). In this paper the authors systematically develop two general classes of equations of motion for performing molecular dynamics simulations at constant temperature. One member of each class is found to be identical to one of the two commonly used methods for performing such simulations. Of those two, one, namely the momentum scaling procedure, is proven to have no effect on the static properties of the simulated system. In addition, the authors have tested the two methods via equilibrium molecular dynamics on the Lennard-Jones fluid and find the resulting velocity autocorrelation functions and self-diffusion coefficients to be in good agreement with those determined by the standard NVE molecular dynamics method. (43 refs.)

118839 Numerical solution of RISM for homonuclear vibrating hard-dumbells. G.A.Chapela, S.E.Martinez-Casas (Dept. de Fisica, Univ. Autonoma Metropolitana-Iztapalapa, Mexico City, Mexico).
Mol. Phys. (GB), vol.50, no.1, p.129-37 (Sept. 1983).
Numerical solutions of the reference interaction site model (RISM) for site-site radial distribution functions $G_{\alpha\beta}(r)$ of a fluid of vibrating hard-dumbells are carried out, using a method of direct substitution in Fourier space. Comparisons with molecular dynamics (MD) results for the same system are given. The intramolecular distribution functions obtained by MD are used in RISM to obtain the corresponding intermolecular site-site $g_{\alpha\beta}(r)$, which in turn are compared against the MD results. These numerical results and further algebraic analysis indicate that the intermolecular site-site correlation functions calculated with RISM, do not depend noticeably on the form of the intramolecular correlation function used in the calculation. Additional evidence on the equivalence of vibrating and rigid hard dumbells is given. (12 refs.)

118840 Stokes-Maxwell relations for the distorted fluid microstructure. S.Hess (Inst. fur Theoretische Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany), H.J.M.Hanley.
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.35-8 (3 Oct. 1983).
Relationships between the coefficients of the expansion of the pair correlation function for a fluid subjected to a shear are derived from a model kinetic equation. They equate a relaxation time with the viscosity and shear modulus of the fluid. Nonlinear phenomena are considered. The results are tested using nonequilibrium molecular dynamic simulation data for a soft sphere system close to freezing. Agreement between the theory and the simulations is satisfactory. (10 refs.)

118841 On the theory of coherent neutron and X-ray scattering from simple liquids. O.I.Gerasimov (Dept. of Theoretical Phys., Odessa State Univ., Odessa, USSR), V.Lisy.
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.60-2 (3 Oct. 1983).
A new relation between the cross section of X-ray coherent scattering and the structure factor (or the neutron scattering cross section) is obtained taking into account the electron density distortions of molecules in simple liquids. Some possible applications and generalizations of this relation are discussed. (8 refs.)

118842 Description of particle trajectories in classical Lennard-Jones liquids. C.S.Murthy, K.Singer (Dept. of Chem., Royal Holloway Coll., Egham, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.299-317 (8 Oct. 1983).
The trajectories of single particles in a simple Lennard-Jones liquid show no regularities that facilitate an intuitively meaningful description. An analysis of the statistics of quasi-oscillations of the cartesian coordinates and of successive right-angle turns of the trajectories is attempted. Simple stochastic processes based on these characteristics lead to reasonable approximations to the self-diffusion constant. Other features discussed include fluctuations in kinetic, potential and total energy, the shape of the local potential field and the curvature of the trajectories. (10 refs.)

61.25 STUDIES OF SPECIFIC LIQUID STRUCTURES

(see also 61.40 Amorphous and polymeric materials)

118843 On the structure factor of metal-molten salt solutions. J.Wiechen, F.Brouers (Inst. of Theoretical Phys., Freie Univ. Berlin, Berlin, Germany).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.387-8 (16 Sept. 1983).
The authors show that in contrast to MSA the HNC approximation can account qualitatively for the long wavelength scattering of metal-molten salt solutions. The difference is attributed to the defects of the MSA in the description of the short-range as well as the long-range order in the liquid. (5 refs.)

118844 Structural determination of a molten (Li-K)Cl mixture of the eutectic composition by X-ray diffraction and molecular dynamics simulation. I.Okada, H.Okano, H.Ohtaki, R.Takagi (Dept. of Electronic Chem., Tokyo Inst. of Technol., Yokohama, Japan).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.436-41 (23 Sept. 1983).
X-ray diffraction was performed for a molten (Li-K)Cl mixture of the eutectic composition at 668K. The three dimensional structure of the melt was determined with the aid of molecular dynamics simulation. (23 refs.)

118845 The pair-correlation functions of water at a pressure of 1000 bar in the temperature range 25-500°C. Yu.E.Gorbaty, Yu.N.Demianets (Inst. of Experimental Mineralogy, Acad. of Sci., Moscow, USSR).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.450-4 (23 Sept. 1983).
Pair-correlation functions for liquid and supercritical water are reported. The behaviour of these functions shows a lessening of the hydrogen bonding and the tetrahedral ordering in the water structure with increasing temperature. Strong evidence that the distribution of intermolecular distances between nearest-neighbour molecules should be discrete is found. The contributions of structurally distinguishable molecules to the coordination number of water are estimated. (17 refs.)

118846 Evidence for inhomogeneities in polyethylene melts as detected by n.m.r. transverse relaxation and free induction. R.Bachus, R.Kimmich (Univ. Ulm, Ulm, Germany).
Polym. Commun. (GB), vol.24, no.10, p.317-20 (Oct. 1983).
Internal substance inhomogeneities leading to a broadening of the proton magnetic resonance linewidth by up to two orders of magnitude have been found with diverse fractions of linear polyethylene in the molten state. This effect can be explained by changes in the magnetic susceptibility due to density inhomogeneities. Fluctuations of the inhomogeneities and diffusive displacements of the observed nuclei lead to partial motional averaging. The molecular weight, frequency and matrix dependences have been studied. (10 refs.)

118847 Thermodynamics of cavity formation in water: a molecular dynamics study. J.P.M.Postma, H.J.C.Berendsen, J.R.Haak (Lab. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands).
Faraday Symp. Chem. Soc. (GB), no.17, p.55-67 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Thermodynamic quantities related to the solvation of hydrophobic solutes in water can be approximated by the application of scaled particle theory. The crucial quantity is the Gibbs free energy of cavity formation. A series of six molecular dynamics simulations of water including repulsive cavities of various sizes has been carried out. Using perturbation statistical mechanics, the free energy has been derived as a function of cavity radius up to 0.32 nm (0.32 nm approach of water oxygens to the cavity centre). The free energy agrees well with predictions from scaled particle theory and the experimental surface tension is predicted to within 5%. The radial distribution of water molecules with respect to the cavity has been determined for five cavity sizes; for one size (radius of approach of water oxygens of 0.3 nm) the orientational distribution and the residence time distribution in the hydration shells has been determined. (23 refs.)

118848 Hydrophobic interactions in dilute solutions of poly(vinyl alcohol). D.Eagland, N.J.Crowther (School of Pharmaceutical Chem., Univ. of Bradford, Bradford, England).
Faraday Symp. Chem. Soc. (GB), no.17, p.141-60 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
High-precision density and light-scattering measurements in water and 10^{-3} mol dm^{-3} electrolyte solutions of samples of 80 and 90% poly(vinyl alcohol) (PvOH) over an extended range of concentration and temperature have revealed a complex pattern of solution behaviour; the report is restricted to the behaviour of solutions at concentrations below 0.15% w/v. Partial molal volume ($\bar{V}_2°$) and expansibility ($\bar{E}_2°$) studies at infinite dilutions in water show the existence of a very strong temperature dependence in these partial molal properties; $\bar{E}_2°$ studies suggest that increasing hydrophobic hydration occurs between 10 and 15°C, which results in a rapid conformational change in the molecule between 15 and 18°C, producing a structure which is predominantly hydrated in the hydrophilic sense. At temperatures above 18°C gradual erosion of this hydration appears to take place. Corresponding studies on a sample of 90% hydrolysed PvOH show broadly similar behaviour, but modified by the presence of a smaller proportion of hydrophobic vinyl acetate groups; for example, the conformation change with temperature is not as abrupt as in the case of 80% hydrolysed PvOH. Similar studies in 10^{-3} mol dm^{-3} solutions of LiCl, Li_2SO_4, NaCl and KCl illustrate the large ionic effects upon the hydrophobically dictated conformational change; these effects compare remarkably well with the calculated thermodynamic property changes, associated with salt effects, in the folding process of the globular protein ribonuclease. Particle size and second virial coefficient values obtained from light-scattering studies confirm the behaviour pattern observed. (34 refs.)

118849 Conformational and functional properties of haemoglobin in water+alcohol mixtures. Dependence of bulk electrostatic and hydrophobic interactions upon pH and KCl concentration. L.Cordone, A.Cupane, F.D'Alia, M.G.De Stefano (Istituto di Fisica, Univ. di Palermo, Palermo, Italy).
Faraday Symp. Chem. Soc. (GB), no.17, p.161-74 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
The reaction of haemoglobin with oxygen in the presence of some monohydric alcohols has been studied at various KCl concentrations and pH values. The analysis of the results followed a previously described approach allowing: (1) the determination of the effects of cosolvents on the free-energy difference between T and R states of haemoglobin and (2) the separation of these effects into contributions linearly related to the variation of the inverse bulk dielectric constant of the water+cosolvent mixture (bulk-electrostatic contributions) and contributions that are ascribed to the variation of protein-solvent hydrophobic interactions (non-bulk-electrostatic contributions). Bulk-electrostatic contributions were found to depend on pH and salt concentration. Non-bulk-electrostatic contributions were also found to increase with increasing pH and salt concentration. Linear correlations, not dependent upon the particular alcohol, were found to connect the non-bulk-electrostatic contributions obtained at different KCl concentrations or pH values. (20 refs.)

118850 Cooperative hydrogen bonding and structural instability in water. J.Leblond (Ecole Superieure de Phys. et Chimie Industrielles, Paris, France).
J. Phys. (France), vol.44, no.10, p.1201-8 (Oct. 1983).
The author proposes a model for liquid water in which the bonding states of each molecule are represented by a 5-level equivalent system. The structural effects are taken into account in a theoretical approach of the 'meanfield' type, the mean-field (internal pressure) being supposed to decrease when the number of 4-bonded molecules increases. The model predicts the dependence of several thermodynamical parameters on T and P, and the existence of a structural stability limit which implies a divergence of α_p, β_T and C_P in the supercooled state. The existence of a structural critical point is discussed. (28 refs.)

118851 Packing and conformational contributions in binary liquid mixtures: acoustic studies of n-hexadecane with dimethylpentanes. A.M.Awwad, A.M.North, R.A.Pethrick (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2333-41 (Oct. 1983).
In order to separate internal (rotational isomeric) and external (intermolecular structural) contributions to volume effects in liquid alkane mixtures, ultrasonic attenuation and velocity measurements have been made on hexadecane and its mixtures with dimethylpentane. Within experimental error the rotational isomeric contribution is a simple sum of those of the pure components. However, the shear and volume viscosity contributions are not linearly additive, but show a negative excess quantity. This is explained on the basis of a structural equilibrium between more ordered (solid-like) and less ordered (more liquid-like) regions in the liquid mixture. The results indicate that there is a geometrical packing component in the mixture interaction parameter, χ_{12}. (35 refs.)

118852 Computer simulation of the dynamics of optically active molecules in the liquid state. M.W.Evans (Edward Davies Chem. Labs., Univ. Coll. of Wales, Aberystwyth, Wales).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1331-40 (Sept. 1983).
The technique of computer simulation is used to produce detailed information on the molecular dynamics of *R*- and *S*-1,1-chlorofluoroethane and the racemic mixture. A critically important difference in the dynamical behaviour of the two enantiomers is revealed using a rotating frame of reference. This is the source of observable differences in laboratory frame auto-correlation functions of the racemic mixture and therefore in measurable liquid phase spectra. Therefore, by measuring the spectrum of either enantiomer, followed by that of their racemic mixture, information is provided directly on the statistical correlation between a molecule's rotation and centre-of-mass translation. The author believes this to be a new explanation for a well known phenomenon of the molecular liquid and solid states of matter. (23 refs.)

118853 An encapsulated dumbbell model for concentrated polymer solutions and melts. I. Theoretical development and constitutive equation. R.B.Bird, J.R.Deaguiar (Chem. Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.149-60 (Sept. 1983).
The finitely extensible nonlinear elastic (FENE) dumbbell model used earlier for dilute polymer solutions may also be used for concentrated solutions and melts if the Brownian motion and hydrodynamic forces acting on the beads are made nonisotropic. This corresponds roughly to imagining that a dumbbell is constrained to move within a capsule-shaped region embedded in the surrounded fluid. The constitutive equation obtained (a modified convected Maxwell model) contains four parameters: σ and β specify the extent of anisotropy in Stokes' law and in the Brownian motion forces respectively; λ is a time constant; and b describes the finite extensibility of the dumbbell. When σ and β are set equal to unity, the dilute-solution constitutive equation is recovered. In this sense the molecular theory permits a description of polymeric liquids over the entire concentration range. (16 refs.)

118854 An encapsulated dumbbell model for concentrated polymer solutions and melts. II. Calculation of material functions and experimental comparisons. J.R.Deaguiar (Chem. Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.161-79 (Sept. 1983).
For pt.I see ibid., vol.13, no.2, p.149 (1983). The constitutive equation derived in Part I is used to compute steady-state and time-dependent material functions. A procedure is suggested for determining the four independent model parameters (λ_H, b, σ, β) from experimental data. Material functions have been calculated using parameters determined by experimental data for concentrated solutions of nearly monodisperse linear polymers. The theoretical curves for steady shear properties (η and Ψ_1) are in quantitative agreement with the data well into the range of nonlinear behavior. The calculated time-dependent properties (η^*, η^+, Ψ^+, η^-) are in qualitative agreement with observed behavior. Theoretical curves for elongational viscosity are reasonable, but suitable experimental data are not available for comparison. (3 refs.)

118855 A RISM analysis of structural data for tetrahedral molecular systems. D.G.Montague, M.R.Chowdhury, J.C.Dore, J.Reed (Phys. Lab., Univ. of Kent, Canterbury, England).
Mol. Phys. (GB), vol.50, no.1, p.1-23 (Sept. 1983).
A systematic study has been made of available X-ray and neutron diffraction data for liquids and amorphous solids composed of tetrahedral molecules. The intermolecular function, $D_M(Q)$, has been compared with predictions computed by the reference interaction site model (RISM) in order to determine the effective hard core radii which characterize the molecular contours. It is found that the RISM formulation gives a satisfactory first-order representation of the data in most cases but there are significant discrepancies which prevent the model being used to give a detailed quantitative description. Specific features are noted in the case of P_4 and As_4 systems which suggest that a central auxiliary site is required to give agreement with the experimental results. The geometrical packing is considered in relation to orientational correlations between adjacent molecules and the systematic behaviour examined for a range of materials. (27 refs.)

118856 The effect of pressure on the structure of light and heavy water. G.A.Gaballa, G.W.Neilson (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Mol. Phys. (GB), vol.50, no.1, p.97-111 (Sept. 1983).
X-ray diffraction experiments were carried out on light and heavy water to pressures of 6 kbar. The results are in qualitative agreement with the molecular dynamics studies of Impey, Klein and McDonald (1981). However, there are appreciable quantitative differences. The intramolecular O-H and O-D linewidths exhibit a different dependence on pressure, and this is interpreted in terms of the differing dynamical properties of the two liquids. The nearest neighbour intermolecular hydrogen bonding O-H correlation is at a separation of $\sim$2.0 Å and there is a 15 per cent increase of coordination number over the pressure range of investigation. For pressures of 1 bar and 5 kbar the nearest neighbour oxygen-oxygen separation changes from 2.89 Å to 2.84 Å in light water and from 2.89 Å to 2.84 Å in heavy water. This result is a factor of 6 larger than that predicted by molecular dynamics and about a factor of 3 less than that inferred from NMR studies. There is also an increase in coordination number of about 10 per cent. Other longer range O-O correlations are observed and a qualitative explanation of their pressure dependence is presented. (28 refs.)

118857 Rayleigh light scattering by liquids composed on interacting anisotropic molecules—spherical tensor approach within the second order approximation of the DID model. T.Bancewicz (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).
Mol. Phys. (GB), vol.50, no.1, p.173-91 (Sept. 1983).
By methods of spherical tensor algebra and applying the dipole-induced dipole (DID) model, a general expression is derived with accuracy to within the second order of statistical perturbation theory for the effective polarizability and Rayleigh-scattered light intensity for liquids composed of unlike anisotropic molecules. The results have permitted the application of a computer simulated binary distribution function to calculate the scattered light intensity. The roles of various contributions to the integral intensity are discussed. Numerical calculations are performed for liquid Br_2 and N_2 pointing to an essential role of angular-radial correlations and cross terms. The general expressions are shown to simplify easily in the particular case of radially but not angularly correlated molecules. (39 refs.)

118858 The structure of liquid benzene. M.Claessens, M.Ferrario, J.-P.Ryckaert (Univ. Libre de Bruxelles, Bruxelles, Belgium).
Mol. Phys. (GB), vol.50, no.1, p.217-27 (Sept. 1983).
Molecular dynamics simulation of liquid benzene is exploited to test the degree of sensitivity of the local structure to the intermolecular potential. Three effective potential models (based on a six Lennard-Jones centres potential) are investigated. The usually admitted picture of a liquid with quasi-crystalline short range molecular arrangement is shown to be very doubtful. Analysis of the crystalline structure predicted by the different interaction potentials indicates a manifest superiority of the only model including a point quadrupole at the centre of the benzene ring. (18 refs.)

118859 Universality for static properties of polystyrenes in good and marginal solvents. P.Wiltzius, H.R.Haller, D.S.Cannell (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA), D.W.Schaefer.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1183-6 (26 Sept. 1983).
Reports the first experimental evidence that solutions of linear flexible polymers are characterized by a concentration-dependent universal length which is easily scaled to be independent of molecular weight $M(3\times10^5\leq M\leq2.6\times10^7)$ and of solvent quality. It is also found that the product of M and the derivative of the osmotic pressure π with respect to concentration c, $M(\partial\pi/\partial c)_T$, is universal and independent of solvent quality of M. (18 refs.)

118860 Local concentration of units and molecular mobility in swelled polymer networks. Yu.Ya.Gotlib, I.A.Torchinskii.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1830-7 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The local concentration of units in the crosslinked network has been evaluated using the Gaussian subchain model. The dependences of local concentration of units on disposition of the studied site of the network, on the density of crosslinking, and on degree of swelling are derived. The local concentration of the network is compared with the concentration of free branches and non-branched macromolecules in concentrated solutions (for the same concentration of a polymer). The effects of heterogeneity of real networks are discussed as well as their role in a decrease of mobility with increasing of the density of crosslinking observed in swelled PS networks by NMR method. (17 refs.)

118861 Light scattering of solutions of polyamidohydrazide and conformational characteristics of its molecules. V.N.Tsvetkov, S.O.Tsepelevich.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1906-13 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The results of measuring of light scattering in solutions of 18 samples of polyamidohydrazide (PAH) in DMSO in more than 10-fold range of MM values are presented. Excluded volume effects do not affect essentially the dimensions of PAH molecules in solution. From the experimentally found MM and gyration radii the value of Kuhn segment is evaluated being equal to $A=240\times10^{-10}$ m. From the viscometry data $A=200\times10^{-10}$ m and the value of the hydrodynamic cross-section $d=5\times10^{-10}$ m. According to the data obtained PAH is a typical rigid polymer. Uncoiled conformation of its molecules is related with high rigidity of the chain, but not with the effect of excluded volume. (30 refs.)

118862 On the existence of micellar positional correlations in a type I nematic lyomesophase: an X-ray diffraction experiment. A.M.Figueiredo Neto, L.Q.Amaral (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.651-8 (1 Sept. 1983).
The nematic type I lyomesophase of K laurate/KCl/water is studied by X-ray diffraction and optical microscopy. X-ray diffraction patterns of samples in very thin capillaries and chemically surface-treated capillaries indicate the existence of a hexagonal array of cylindrical micelles. In normal conditions, where only one oriented band is observed, it is possible to describe the lyomesophase structure as nematic. An analysis of the band width is made by comparing the experimental scattering curves with theoretical expressions obtained from different models. This analysis indicates that micellar positional correlations have to be introduced to explain the experimental results. (35 refs.)

118863 Exact solutions for liquid crystal configurations and an improved boundary layer model. R.N.Thurston (Bell Telephone Labs., Holmdel, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4966-88 (Sept. 1983).
The director configuration in a liquid crystal cell is basic to an understanding of both the optical contrast between states and switching dynamics. This paper treats the voltage dependence of nematic liquid crystal configurations in which the director orientation depends on a single space coordinate z, and there are equal but oppositely tilted boundary conditions on the two cell surfaces at $z=\pm d/2$. In the boundary layer model, configurations are approximated by joining together pieces of 'boundary layer solutions', which are solutions of the equations for equilibrium configurations in a half space with the boundary condition θ=constant at only one surface and $\theta=d\theta/dz=0$ at $z=\infty$, where θ is measured from the normal to the surface. This paper (1) indicates exact solutions that satisfy the cell boundary conditions, (2) examines their high voltage asymptotes, (3) proves that the boundary layer solutions reproduce the essential features of these asymptotes, and (4) presents a way of fitting boundary layer solutions into a finite cell by joining them where $\theta=\theta_{\min}$ such that $\theta_{\min}$ is the correct asymptotic function of voltage. Topologically distinct horizontal (H) and vertical (V) states are distinguished by the boundary conditions: if $\theta=\theta_b$ at one surface, then at the other surface $\theta=-\theta_b$ for V and $\pi-\theta_b$ for H. The H state can be symmetric (H_S) or asymmetric (H_A). All of these states are treated, with emphasis on the high voltage asymptotic behavior. Below the H_A-H_S threshold, H_A is nonexistent, and H_S is stable; above this threshold, H_A is stable and H_S is unstable [Julian Cheng, R.N. Thurston, and D.W. Berreman, J. Appl. Phys. 52, 2756 (1981)]. (38 refs.)

118864 The rotational viscosity of nematic liquid crystal mixtures at low temperatures. H.Schad (Brown Boveri Res. Center, Baden, Switzerland).
J. Appl. Phys. (USA), vol.54, no.9, p.4994-7 (Sept. 1983).
An experimental setup is described for the determination of the rotational viscosity γ_1 of nematic liquid crystals which operates at temperatures down to $-60°C$. Using this setup the author has determined γ_1 of several liquid crystal mixtures over a wide temperature range and finds significant deviations from Arrhenius behavior at lower temperatures. (13 refs.)

118865 On cooperative modes of reorientation in liquid crystals. G.P.Zientara, J.H.Freed (Baker Lab. of Chem., Cornell Univ., Ithaca, NY, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3077-89 (15 Sept. 1983).
The role of cooperative modes of reorientation in liquid crystals for the spectral densities of importance in magnetic resonance relaxation is examined from the viewpoint of microscopic models that can be solved analytically. These include linear arrays of rods in an applied external field whose orientations are strongly coupled and whose motion is described by overdamped and coupled diffusion equations. Also considered are Cayley-tree models, which, at least for nearest neighbors, can mimic higher dimensions than one. All these models lead to the result that the qth normal mode of relaxation has a decay rate that depends upon q as $\sin^2(qa/2)$, where a is the lattice spacing. Using simple scaling, it is argued that if a is replaced by $a'\equiv La$, so the authors' model consists of blocks of L rodlike molecules with renormalized parameters, then molecular detail becomes less important and the model arrays become more physically representative. These results are then utilized to extend the standard hydrodynamic theory for long wave vectors q to short wave vectors approaching molecular dimension. The spectral densities obey scaling (i.e. are nearly independent of a') and are nearly identical to the hydrodynamic result for lower frequencies. However, the new results do show small departures at the higher frequencies usually studied by NMR. (35 refs.)

118866 The first bilayer ferroelectric liquid crystal. H.R.Brand (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), P.E.Cladis, P.L.Finn.
J. Phys. Lett. (France), vol.44, no.18, p.L771-6 (15 Sept. 1983).
The authors have found the first chiral smectic C liquid crystal formed by strongly bound anti-parallel pairs of molecules. The director of the new phase, which has a net permanent polarization, can be oriented in an electric field in a way similar to a chiral C phase formed by monomers. (14 refs.)

118867 Flow-alignment and the sign of κ_2 in nematic liquid crystals. W.W.Beens, W.H.de Jeu (Solid State Phys. Lab., Univ. of Groningen, Groningen, Netherlands).
J. Phys. Lett. (France), vol.44, no.19, p.L805-9 (1 Oct. 1983).
Results are presented for the flow-alignment angle θ_0 of various nematics. Measurements for two compounds that differ mainly in the presence of a strongly polar terminal cyano-group indicate that this has no influence on θ_0. Results for a homologous series give a decrease of θ_0 with increasing alkyl chain lengths, until finally no flow-alignment exists due to a change in sign of κ_2. This is attributed to pretransitional smectic order. (10 refs.)

118868 Conformational flexoelectricity in nematic liquid crystals. I.Dozov, P.Martinot-Lagarde, G.Durand (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France).
J. Phys. Lett. (France), vol.44, no.19, p.L817-22 (1 Oct. 1983).
Using the direct flexoelectric effect in an hybrid (homeotropic-planar) nematic cell, the authors have measured the bulk flexoelectric coefficient e^* for two cyanobiphenyl compounds. ICB and 8OCB. For 8CB, the flexo coefficient is comparable in sign and magnitude with that of MBBA, i.e. $e^*\sim+10^{-4}$ cgs. 8OCB presents an anomalously large and negative $e^*\sim-5\times10^{-4}$ cgs. The small influence of the cyano group can be explained by molecular pairing. The large effect from the oxygen is interpretated by a coupling between the macroscopic bend distortion and conformations of the alkoxy chains, i.e. as conformational (dipolar) flexoelectricity. The temperature dependence of e^* shows an unexpected proportionality to the nematic order parameter S. This may be related to the steric constraint, from the rigid rod cores, on the entropy of the alkoxychains. (10 refs.)

118869 Nature of the mesophase of a conducting charge transfer complex: neither discotic nor calamitic. P.Davidson, A.M.Levelut (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), H.Strzelecka, V.Gionis.
J. Phys. Lett. (France), vol.44, no.19, p.L823-8 (1 Oct. 1983).
The authors describe the structure of the mesophase of a conducting charge transfer complex formed by a donor substituted by four long paraffinic chains and TCNQ as acceptor. In the mesophase the donor cores remain in stacks with a short core-to-core distance (3.6 Å). The presence of paraffinic chains favours a layer structure, the stacks being localized in the lamellae and TCNQ likely filling the space between stacks. Therefore the organization in this mesophase is intermediate between those of smectic and columnar discotic liquid crystals. (13 refs.)

118870 The cholesteric blue phase: a progress report. P.P.Crooker (Dept. of Phys. & Astron., Univ. of Hawaii, Honolulu, HI, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.31-45 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Experimental studies of the blue phase of cholesteric liquid crystals have revealed two cubic phases (BPI and BPII) and a possible amorphous 'fog' phase (BPIII). In addition, a number of theoretical models have been proposed which arrive at these structures from the point of view of a Landau theory, a lattice of disclinations, or as an ordered emulsion. The author reviews the present state of knowledge of the blue phase and show the significance of blue phase studies to other problems in condensed matter research. (22 refs.)

118871 Molecular reorientation in liquid crystals. J.A.Janik (Inst. of Nuclear Phys., Krakow, Poland), M.Godlewska, T.Grochulski, A.Kocot, E.Sciesinska, J.Sciesinski, W.Witko.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.67-81 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The results of quasielastic neutron scattering (QNS) experiments for nematic and smectic liquid crystals performed in different laboratories are reviewed and compared with results of dielectric relaxation studies. The fIR spectra for PAA and HOAB in the frequency range of 20-200 cm^{-1} are presented. $\alpha(\bar{\nu})$ values for the nematic and isotropic phases in the whole frequency range including the microwave and submillimeter regions are discussed in terms of the two-time model for molecular librations in the potential cage (confined rotator model). The model fits very well all the experimental data obtained from microwave, carcinotron and fIR techniques. Additionally it may explain the discrepancy between QNS and dielectric relaxation correlation times. (4 refs.)

118872 Liquid crystal orientation on inorganic surfaces. T.Uchida, M.Ohgawara, Y.Shibata (Dept. of Electronic Engng., Faculty of Engng. Tohoku Univ., Sendai, Japan).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.149-61 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
It has been known empirically that some kinds of liquid crystal align perpendicular to inorganic flat surface such as In_2O_3 film. The authors evaluate the adsorbabilities of various amphiphilic materials to inorganic surfaces by using a chromatographic effect and investigate the correlation between the adsorbability and the liquid crystal orientation. From the results, it is found that the perpendicular alignment of liquid crystal is induced when polarities of the amphiphilic material and substrate surface are both strong. It is also found that there is evident relation between the polarity and IEPS (Isoelectric Point of Solid Surface) which is a measure of basicity of the surface. This fact suggests that adsorption of the amphiphilic impurity to the surface is due to the acid-base interaction. (17 refs.)

118873 Electrohydrodynamic behavior in twisted-wedge nematic structures. J.A.Martin-Pereda, M.A.Muriel, F.J.Lopez (Dept. de Electronica Cuantica, Univ. Politecnica de Madrid, Madrid, Spain).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.183-91 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
A new type of domain for nematic liquid crystals with a twisted-wedge structure is presented. This new type of domain appears from the low frequency range to 10 kHz. This behavior was observed for square and pulsed excitations. The liquid crystal was N-(*p*-methoxybenzylidene-p'-butylaniline) (MBBA) used at room temperature. These domains offer a higher degree of complexity than conventional Williams domains. The corresponding stability chart is presented. (10 refs.)

118874 Study of S_A phase structure using dielectric relaxation. C.Druon, J.M.Wacrenier (Univ. de Lille, Villeneuve D'Ascq, France).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.201-8 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The results of a study of dielectric relaxation for several mesomorphous substances are presented. These compounds allow us to obtain information on the following phases: the nematic phase—partially bilayer (S_{Ad}), bilayer (S_{A2}) and monolayer (S_{A1}) smectic A phases—the antiphase smectic A ($S_{\tilde{A}}$). The measurements were performed with the electric field parallel to the director. The absorption observed is due to the reorientation motion of the molecule round an axis perpendicular to its longitudinal axis. The activation energy W of this movement was measured for all phases. Results show clearly that for these compounds $W_{SAd}<W_N$, $W_{SA1}\sim W_N\sim W_{S\tilde{A}}$ and $W_{SA2}>W_N$. In each case an explanation has been suggested to interpret these changes in the activation energy. This points out the possibility of showing the existence of some S_A phases using dielectric relaxation. (13 refs.)

118875 The cholesteric pitch in lyotropic solutions of a semi-rigid macromolecule: hydroxypropyl-cellulose. F.Fried, J.M.Gilli, P.Sixou (Lab. de Phys. de la Matiere Condensee, Univ. de Nice, Nice, France).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.209-21 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The cholesteric pitch P of lyotropic mesophases of hydroxypropyl-cellulose are determined from optical measurements, i.e. angular dependence of the scattered light intensity and transmission spectra. The observed results are explained with help of Pincus' theory (1968) for cholesteric liquid crystals. The variations of the twisting power with physical parameters such as polymer concentration C, nature of solvent, molecular weight, and ageing are investigated. The power law $P=P_0C^{-\alpha}$ is well satisfied for all polymer solvent combinations. It is proposed that the solvent could influence the cholesteric pitch not only through its intrinsic properties, but also through modifications of the macromolecular characteristics themselves. (32 refs.)

118876 McMillan theory of binary smectic mixtures. W.Wagner (Zentralinst. fur Elektronenphys., Akad. der Wissenschaften, Berlin, Germany).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.247-55 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The molecular field theory of the smectic A phase, developed by McMillan (1971), is extended to binary smectic mixtures. Expressions for the orientation-dependent mean field potential of each component are derived. Besides the interaction terms of the pure components, two additional parameters appear. These mixed parameters describe the interaction forces between particles of different species. The composition dependences of the transition temperatures are determined from the free energies. The possible existence of a two-phase region is neglected. By suitable choices of the interaction parameter set, it is possible to predict induced phases. If all interaction parameters satisfy the geometric mean rule, the mixture will be an ideal one, exhibiting linear phase transition lines. Because of the coupling between the smectic order and the nematic order, the transition lines of both phases are correlated. By fitting an experimental phase diagram one is able to determine the unknown values of the mixed interaction parameters. (10 refs.)

118877 The crystal and molecular structure of a reentrant nematogen: 4-cyanophenyl-3-methyl-4′-(4″-n-undecyloxy cinnamoyloxy)benzoate (11 CPMCB). G.V.Vani (Raman Res. Inst., Bangalore, India).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.275-84 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The crystal and molecular structure of 4-cyanophenyl-3-methyl-4′-(4″-n-undecyloxycinnamoyloxy)benzoate (11 CPMCB), $C_{35}H_{39}O_5N$, has been determined at room temperature by direct methods. The compound, which exhibits a reentrant nematic phase, crystallizes in the triclinic space group $P\bar{1}$, $a=10.368$, $b=10.846$, $c=16.750$ Å, $\alpha=97.90$, $\beta=100.28$, $\gamma=118.68°$, with two molecules in the unit cell. The structure has been refined to $R=0.106$, using photographically observed data. The 11 CPMCB molecules pack in a well-imbricated antiparallel arrangement with their alkoxy chains fully extended. The molecular packing in the crystal is discussed with reference to the reentrant behavior of the compound. (11 refs.)

118878 Orientational order of spin probe molecules in liquid crystals. S.K.Ghosh, A.Panatta (Univ. dell'Aquila, L'Aquila, Italy), A.Ricchiuto, P.L.Indovina.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.349-59 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Reports measurements of hyperfine splittings and g-values of two nitroxide spin probes 4′4′-dimethyl-spiro-(5α-cholestane-3,2-oxazolidin)-3′-yloxyl and 2-(10-carboxydecyl)-2-hexyl-4,4-dimethyl-3-oxazolidinyloxyl methyl ester dissolved in p-azoxyanisole. Using the principal axes values of $\mathbf{g}$ and $\mathbf{A}$ tensors available, the authors have determined all three diagonal components of the orientation order parameter tensor $\mathbf{S}$ for these spin probe molecules. For neither of the spin probes used has this tensor $\mathbf{S}$ the cylindrical symmetry that is normally assumed to determine the orientational order parameter tensor $\mathbf{S}^{(p)}$ defined by the long molecular axis from such measurements. This conclusion about $\mathbf{S}$ is independent of any uncertainty in the principal axes values of the $\mathbf{g}$ and $\mathbf{A}$ tensors, and hence the relations between $\mathbf{S}$ and $\mathbf{S}^{(p)}$ normally used do not seem to be well justified. Probable relations are also suggested. (13 refs.)

118879 Importance of steric effects in the isotropic phase of nematogenic compounds. J.P.Parneix, C.Legrand, D.Decoster (Univ. des Sci. et Tech. de Lille 1, Villeneuve d'Ascq. France).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.361-74 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The dielectric spectra of some mesomorphic substances in their isotropic phase are reported. The measurements are carried out from the radio frequencies up to the far infrared region. The authors have investigated several substances such as azoxybenzenes, cyanophenylcyclohexanes, azomethines, tolanes and biphenyls. Two special cases appear with the last two series where the dipole moment is directed either perpendicular or parallel to the long molecular axis respectively. The dielectric spectra show different absorption connected with rotational movements around or perpendicular to the long axis. The influence of the molecular surrounding on the dielectric properties is also studied by investigating the influence of dilution. The results have been discussed by using a computer simulation of molecular dynamics of fluid systems containing ellipsoidal particles which interact pair-wisely, assuming the interactions to be governed mainly by steric effects. (6 refs.)

118880 Orientational order of long-chain molecules in the nematic phase. S.K.Ghosh (Univ. of dell'Aquila, L'Aquila, Italy).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.375-84 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
It is shown that the quadrupole splittings arising from the different deuterium sites of long-chain molecules constituting nematic liquid crystal phase can be well understood with a single order parameter tensor $\mathbf{S}$ defined for the whole molecule by its long molecular axis, as has been suggested elsewhere. This is demonstrated explicitly for p-cyanobenzylidene-p'-d_{17}-octyloxyaniline and p-butyloxybenzylidene-p'-d_{17}-octyl-2,6-d_2-aniline. The role of molecular conformations in relation to the observed splittings has been made evident by recovering the average quadrupole coupling constants and orientations of different C-D bonds for both molecules. These values are in reasonable agreement. (15 refs.)

118881 Novel liquid crystalline derivatives of cubanes and hydrogenolyzed cubanes. G.W.Gray, N.A.Langley, K.J.Toyne (Dept. of Chem., Univ. of Hull, Hull, England).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.425-31 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The N-I transition temperatures for a range of 4-propyl 1-monoesters and several 1,4-diesters of cubane, bicyclo(2.2.2)octane, cyclohexane and benzene have been determined. The differences between the values for the monoesters and diesters of each system and between those for the various ring systems for the mono- and di-ester series are discussed. Cubane has a very poor ability to generate nematic phases of high thermal stability, and the relative nematic stability of the benzene derivatives are significantly different in the series, the diesters with a central benzene ring having the highest N-I transition temperatures. The values for diesters and monoesters of dihydrocubane are compared with those for cubanes and the effect of deviations from colinearity of the substituent bonds of changes in flexibility are discussed. (5 refs.)

118882 Regulation of heat transfer using liquid crystals in the presence of electric fields. E.F.Carr (Dept. of Phys., Univ. of Maine, Orono, ME, USA).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.6, p.165-70 (1983).
The heat transfer through a fluid depends both on the thermal conductivity and the motion of the fluid. When the fluid is a certain type of liquid crystal, the motion of the fluid can be controlled by an electric field. Results presented here show that the rate of heat transfer increased by at least a factor of ten when a high field was applied. Results are reported showing how a model proposed earlier can be used to explain the fluid's motion which started at the instant the field was applied. (5 refs.)

118883 Relationships between miscibility grouping and smectic mesophase structure. J.W.Goodby (Bell Telephone Labs., Murray Hill, NJ, USA).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.6, p.171-7 (1983).
Classification of smectic liquid crystal mesophases has been based on the concept of comiscibility between like phases. Based on thermodynamic principles this categorization scheme is not related directly to the structures of the phases. The elucidation of the structures of the various smectic modifications has shown that each miscibility group possesses a set of structural parameters common to all examples of that group. Also present are structural factors which form subsets of the miscibility group. These two sets of structural characteristics are defined for each miscibility group. (22 refs.)

118884 Application of macromolecular materials in the preparation of stable layers of cholesteric liquid crystals. W.Borys, S.Klosowicz, J.Zmija (Wojskowa Akad. Tech., Warszawa, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.3, p.87-8 (March 1983). In Polish. [received: Oct. 1983]
Several alternative methods for the preparation of thermographic layers of cholesteric liquid crystals with the use of Polish-made polymeric materials have been presented. (5 refs.)

118885 Solitons in ferroelectric liquid crystal. A.S.T.Pires, F.C.Sa Barreto (Dept. de Fisica-ICEx, Univ. Federal de Minas Gerias, Belo Horizonte, Brazil).
Phys. Status Solidi b (Germany), vol.119, no.1, p.121-30 (1 Sept. 1983).
The stable phases of liquid crystals whose constituents contain chiral molecules are studied. Starting from the Landau free energy for the order parameter the soliton-lattice solution of the incommensurate phase is analysed in detail. The solutions of the normal and commensurate phases are obtained by the transfer matrix method. (11 refs.)

118886 Determination of pitch in chiral smectic C DOBAMBC. S.A.Rozanski (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
Phys. Status Solidi a (Germany), vol.79, no.1, p.309-12 (Sept. 1983).
Selective reflection, Lagarde, Cano, and light diffraction methods are used for the determination of the pitch in chiral smectic C DOBAMBC {i-amyl-4-[4-decyloxybenzylideneamino]-cinnamate}. All four methods give consistent results. In the selective reflection, the rotation of sample enbles the observation of the second peak previously predicted by Berreman (1973), situated at about twice the wavelength of the first peak. (18 refs.)

118887 Thermotropic homopolyesters. Investigation of the smectic phase of polyesters based on *p,p′*-bibenzoic acid. W.R.Krigbaum, J.Watanabe (Gross Chem. Lab., Duke Univ., Durham, NC, USA).
Polymer (GB), vol.24, no.10, p.1299-307 (Oct. 1983).
The authors report a study of the mesophases of the homologous series of polymers prepared from p,p'-bibenzoic acid and the tetra-, hexa-, octa-, and decamethylene glycols. These polymers are designed BBn, where n is the number of methylene units in the diol. The BB4 and BB6 polymers form a thermotropic smectic phase which was independently identified as S_A by mutual miscibility studies with a known low molecular weight mesogen, TBBA, and by X-ray diffraction studies of oriented samples. The enthalpy change for the smectic-isotropic transition is only 1.4 Kcal mol^{-1} a value consistent with a smectic phase of low order. The smectic layer spacing is shorter than the fully extended length of the repeating unit for both BB4 and BB6. Low molecular weight samples of BB6 exhibit three crystal modifications. The two higher temperature forms have the same c-axis spacing as the smectic layer spacing, 18.7 Å, while the polymorph stable at room temperature has a fibre repeat of 32 Å, indicating a still smaller distance per repeating unit, 16 Å. All of these values are smaller than the 20 Å length of the fully extended repeating unit. Shearing the smectic phase of BB6 polymers having $\eta_{\text{inh}}<0.45$ dL/g produces a highly oriented sample in which the repeating units are perpendicular to the direction of flow. Shear of the smectic phases of polymers having higher intrinsic viscosities breaks up the smectic structure, and leads to less perfect orientation of the molecules parallel to the shear direction. (25 refs.)

118888 Orientational ordering of liquid crystals considered in the molecular field approximation with a modified model potential. A.A.Gerasimov, L.N.Lisetskii.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.499-500 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.872-4 (March 1983). [received: Oct. 1983]
In the approximation of an average molecular field the orientational order of nematic liquid crystals is described by a system of self-consistency equations. It follows from the results of quantum-chemical calculations that the contribution of terms with odd indices to the expansion of the angular dependence of the interaction energy of two molecules in terms of Legendre polynomials can be very considerable. Applying the standard technique used in the molecular field approximation, the authors show that the terms with odd values of M are generally retained also in the expression for the pseudopotential. (13 refs.)

118889 Possible mechanism of the spontaneous Freedericksz effect. A.V.Kaznacheev, A.S.Sonin.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.528-30 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.917-20 (March 1983). [received: Oct. 1983]
In nematics having a negative dielectric anisotropy, there is observed an interesting physical effect of spontaneous loss of homeotropic orientation at a certain critical layer thickness. The critical field for the Freedericksz transition is considerably reduced. For a substance having a positive dielectric anisotropy, this effect has not been observed. The authors present a theoretical treatment of the effect by considering the free energy and surface energy of the nematic layer. (4 refs.)

118890 Structural peculiarities of liquid crystalline ordering of polymers with heavy atoms in the main chain. V.V.Tsukruk, V.N.Bliznyuk, V.V.Shilov, Yu.S.Lipatov.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1370-4 (Sept. 1983). In Russian.
Liquid crystalline polymers with heavy atoms in the main chain have been studied by X-ray and electron-microscopic methods. The size and character of aggregation of layered packs in liquid crystalline polymers were determined. Separate layered packs consist of 4 to 6 planar smectic layers 4 nm thick. (13 refs.)

118891 Crystallization of amorphous silicon nitride. N.V.Kovtun, I.T.Ostapenko, N.S.Poltavtsev, I.A.Snezhko, V.R.Tarasov (Kharkov Physicotech. Inst., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1483-4 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1726-7 (Oct. 1982). [received: Sept. 1983]
The effect of annealing under vacuum at 1570-1870K on the crystallization of amorphous Si_3N_4 obtained by a plasma-chemical method was investigated. It was shown that at 1670-1870K a stable phase of α-Si_3N_4 was formed. (8 refs.)

118892 Ordering effects in the Fe-Al system. R.Kuentzler (Lab. de Magnetisme et de Structure Electronique des Solides, Strasbourg, France).
J. Phys. (France), vol.44, no.10, p.1167-78 (Oct. 1983).
Low temperature specific heat measurements have been performed on disordered $Fe_{1-c}Al_c$ samples in the concentration range $0.10 \leq c \leq 0.50$. A drastic difference between the 'electronic' specific heat of the disordered and ordered samples is observed. This observation joined to the recent knowledge on the particularly complex phase diagram led to reconsider the results obtained about the physical properties of the FeAl alloys. A qualitative review of some physical properties, namely the specific heat, magnetic susceptibility and magnetization, show that these properties depend strongly upon the state of the system at a given concentration. The annealed (ordered), quenched (partially ordered) and cold-worked (disordered) states of samples are used to investigate the ordering effects. (79 refs.)

118893 Structural aspects of substituted morpholinium TCNQ complexes. R.J.J.Visser, J.L.De Boer (Lab. of Chem. Phys., Materials Sci. Center, Groningen, Netherlands).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1219-21 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Substituted (thio)morpholinium TCNQ complexes, of which 20 structures are known by now, have interesting aspects in phase-transitions, electrical conductivity, thermal expansion, diffuse scattering, incommensurabilities and twisted crystal forms. (6 refs.)

118894 Structure of glassy early-transition-metal—late-transition-metal hydrides. K.Samwer, W.L.Johnson (W.M. Keck Lab. of Engng., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.2907-13 (15 Sept. 1983).
Hydrogen is used as a probe for obtaining structural information on metallic glasses. Results from experimental radial distribution functions of hydrided and unhydrided Zr_3Rh and Zr_2Pd glasses show a significant change in the nearest-neighbor distance of Zr atoms. The measured distance suggests that hydrogen occupies mainly tetrahedral sites defined by four Zr atoms under normal hydriding conditions (1 atm H_2, $\sim$200°C). A statistical model for these sites based on current dense-random-packing models is in good agreement with the observed absorption capacity for hydrogen. The authors predict that H-H interaction should limit the upper value of hydrogen content in Zr-based glasses to 2.5 (H/metal atom). (21 refs.)

61.40D Glasses

118895 Experimental investigation on the thermal stability of metallic glasses. H.W.Bergmann, U.Brokmeier, H.U.Fritsch (Inst. fur Werkstoffkunde und Werkstofftech., Tech. Univ. Clausthal, Clausthal, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.757-61 (Sept. 1983).
There are many instances in practice of phase changes in which the initial phase, e.g. a homogeneous melt, is not replaced by one or more thermodynamic stable phases but rather by metastable phases. Knowledge of systems in which metastable phases can form has increased considerably in recent years. Rapid quenching increases the tendency to form metastable phases including ultimately for appropriate compositions the amorphous metallic glasses. In any discussion about metastable phases there arises the question of the conditions under which they form and their stability which depends on temperature, pressure and composition. Some attempts to describe the thermal stability of metallic glasses and the experimental means of measuring it are discussed. (15 refs.)

118896 Composition of phosphosilicate glass films obtained by hydrolysis of tetraethoxysilane solutions. V.M.Kedyarkin, T.I.Firsova, N.N.Vyshinskii, V.A.Alferov, G.T.Vlasenko, S.A.Krivelevich.
Inorg. Mater. (USA), vol.18, no.11, p.1639-43 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1904-8 (Nov. 1982).
Thermal treatment of phosphosilicate glass films above 200°C causes a chemical reaction between the phosphorous and the silicon-oxygen network accompanied by the formation of Si-O-P bonds. The amount of bound phosphorus increases as its concentration in the film-forming solution rises to a limit governed by the concentrations of the silanol and siloxane groups, which react with the orthophosphoric acid. The bound phosphorus is held tightly within the film. Formation of interlocking phosphosilicate chains is conducive to more compact structures. Phosphosilicate glass films are best heated under oxygen. (9 refs.)

118897 Properties and structure of glasses in the system $10K_2O{\cdot}20Ba0{\cdot}70(SiO_2, GeO_2,B_2O_3)$. G.A.C.M.Spierings (Phillips Res. Labs., Eindhoven, Netherlands).
J. Mater. Sci. (GB), vol.18, no.10, p.2963-8 (Oct. 1983).
Density, refractive index, glass transition temperature and expansion coefficient of glasses in the system $10K_2O{\cdot}20BaO{\cdot}(70\text{-}x\text{-}y)SiO_2{\cdot}xGeO_2{\cdot}yB_2O_3$ (mol%) have been determined. The structure of these glasses is discussed with emphasis on the shifts occurring in the boron and germanium coordination as a function of the relative concentrations of the three network-forming oxides. In GeO_2-rich glasses part of germanium is present as GeO_6 octahedra, which, upon the introduction of B_2O_3, are completely transformed into GeO_4 tetrehedra at $y > 10$. (16 refs.)

118898 Surface crystallization of a fluoride glass. N.P.Bansal, R.H.Doremus (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.132-3 (Aug. 1983).
Growth of crystals on the surface of a Zr-Ba-La fluoride glass was observed by optical and scanning electron microscopy. Small, dark crystals nucleated rapidly and grew to a size of ≈ 10 μm; then they stopped growing, and wrinkled regions emerged, covering the entire crystal surface. (3 refs.)

118899 Glass forming ability of alloys on the basis of Fe-C. I.Schmidt (Inst. fur Werkstoffe, Ruhr-Univ. Bochum, Bochum, Germany).
Z. Metallkd. (Germany), vol.74, no.9, p.561-8 (Sept. 1983).
Fe-C based alloys are rapidly quenched from the liquid state. V, Cr, Mo, W, Co, Ni, B, Si, Ge, Sn are used as third alloying elements. Light- and transmission electron microscopy give information about the influence of these elements on the glass forming ability (GFA) of Fe-C alloys in connection with the arising crystalline phases and microstructures. Characteristic free energy-concentration diagrams and time-temperature-crystallization diagrams illustrate that an optimum GFA can be achieved if in addition to the thermodynamic stability of the amorphous phase the relative and kinetic stability are taken into account which characterize the velocity of the occurring crystallization reactions. (27 refs.)

118900 Investigations on demixing and crystallization behaviour of metallic glasses of the system palladium-nickel-phosphorus. G.Schluckebier, B.Predel (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Z. Metallkd. (Germany), vol.74, no.9, p.569-76 (Sept. 1983). In German.
Ni-Pd-P alloys with concentrations near the section ($Ni_{0,81}P_{0.19}$)-($Pd_{0,84}P_{0.16}$) have been rapidly quenched from the melt using the centrifuge method. Interpretation of the thermograms and Guinier photographs disclose a number of phenomena which are elapsing on the transition of the samples from the metastable into the equilibrium state during different heat treatments in a differential scanning calorimeter. Among others, this is the separation of the initial one-phase glass, after heating it over the glass temperature, into two supercooled melts, which are transformed, on cooling, into two separate glass phases. The different crystallization behavior of both the phases is investigated and its influence upon the glass transforming temperature is observed. Finally, the effects of an autothermal acceleration of the crystallization are reported about. (11 refs.)

61.40K Polymers, elastomers, and plastics

118901 A note on the crystal structure of nylon-12. A.J.Owen, P.Kollross (Inst. fur Phys., Univ. Regensburg, Regensburg, Germany).
Polym. Commun. (GB), vol.24, no.10, p.303-6 (Oct. 1983).
The crystal structure of uniaxially and uniplanar-axially oriented sheets of nylon-12 was investigated by means of wide-angle X-ray scattering, and the results compared with those found in the literature. Differences in unit cell dimensions could be traced to differences in orientational symmetry of the specimens. It is suggested that nylon-12 forms random mixed crystals with respect to the directionality of the chain and that this type of statistical disorder prevents good agreement between observed WAXS intensities and predictions from perfect crystal model structures. (18 refs.)

118902 Hydrogen bonding in segmented polyurethanes: band assignment for the carbonyl region. R.E.Camargo, C.W.Macosko, M.Tirrell, S.T.Wellinghoff (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).
Polym. Commun. (GB), vol.24, no.10, p.314-15 (Oct. 1983).
The extent of interurethane hydrogen bonding is frequently used to study the degree of phase separation in segmented polyether-urethanes. A series of hard and soft segment model compounds were prepared to investigate the frequency band assignment for free or hydrogen bonded urethane carbonyls in the bulk materials. Previous band assignments were done in solution. Highly crystalline hard segment model materials prepared from 4,4′ diphenylmethane diisocyanate (MDI) and normal alcohols, have a high degree of interurethane hydrogen bands. These materials display a single carbonyl peak at 1705 cm^{-1}. Soft segment materials prepared from a hydroxyl terminated polyethylene oxide capped polypropyleneoxide ($\bar{M}_n=2000$) and MDI or phenylisocyanate have essentially no interurethane hydrogen bonding due to dilution in the polyether matrix. These materials show a single band at 1730 cm^{-1}. Based on these results, previous band assignments done in solution have been confirmed. (11 refs.)

118903 Chemical doping of polyacetylene by transition metal halides. H.Shirakawa, T.Kobayashi (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.3-10 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Doping effect of various transition metal halides on polyacetylene were studied in solution, doping as a function of doping time and solvent. (10 refs.)

118904 Chemical n-doping of polyacetylene. B.Francois, C.Mathis (Centre de Recherches sur les Macromolecules, CNRS, Strasbourg, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.21-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The mechanism of polyacetylene n-type doping is discussed. New dopants such as alkaline carbanionic salts and tetraalkyl-ammonium salt of dianionic benzophenone are reported. Swelling studies show that a polar solvent such as THF inserts reversibly in n-doped $(CH)_x$ and that the driving force of this insertion is the cation solvation energy. This solvation drastically influences electrical conductivity (σ). At low doping level σ strongly increases by THF insertion whereas σ decreases at high doping level. Doping with diphenylhexyl-lithium was performed in nonpolar solvent and σ variation with doping level is presented. (11 refs.)

118905 Structural studies of polyacetylene and its blends. S.K.Tripathy, M.Rubner, T.Emma, J.Georger, P.Cukor (Fundamental Res. Lab., GTE Labs. Inc., Waltham, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.37-43 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The microstructure of polyacetylene and its blends with elastomers, produced with the 'Shirakawa' catalyst has been investigated using electron microscopic techniques. Structural richness of the as synthesized material and possibilities of its modification in the polyblends is emphasized. (13 refs.)

118906 Structural studies on undoped poly(acetylene). D.C.Bott, C.K.Chai, D.L.Gerrard, R.H.Weatherhead, D.White, K.P.J.Williams (British Petroleum Res. Centre, Sunbury-on-Thames, England).
J. Phys. Colloq. (France), vol.44, no.C-3, p.45-52 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A full investigation of the chemical structure and morphology of undoped poly(acetylene) is a necessary prerequisite for complete understanding of its novel electrical properties. Various techniques have been used to characterise poly(acetylene) produced by a number of synthetic routes. Transmission electron microscopy and electron diffraction experiments have shown unambiguously that the chain axis of poly(acetylene) is parallel to the fibril axis in all samples examined. Resonance Raman experiments have shown distributions of conjugation lengths which vary according to the synthetic route and subsequent thermal treatment. Other techniques have also been used to investigate chemical structure and defects. These results are discussed in terms of their possible effects on electrical conduction. (15 refs.)

118907 Structure and properties of conducting polyacetylene complexes. R.H.Baughman, N.S.Murthy, G.G.Miller, L.W.Shacklette, R.M.Metzger (Allied Corp., Corporate Res. Center, Morristown, NJ, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.53-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Experiment and theory are combined to derive crystallographic features and their consequences for polyacetylene charge-transfer complexes. A highly disordered spatial distribution of dopant is predicted and observed for lithium complexes. Periodic structures are predicted and observed for complexes involving larger dopants. The alkali metals sodium through rubidium form tetragonal channel complexes in which columns of alkali metal ions are each surrounded by four polyacetylene chains. Both first-stage and higher-stage layer complexes have been observed for iodine-doped polyacetylene. (30 refs.)

118908 Effects of sample mounting techniques on apparent polyacetylene morphology. H.Rommelmann, R.Fernquist, A.J.Epstein, T.Woerner, M.Aldissi (Xerox Webster Res. Center, Webster, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.83-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Compares scanning electron micrographs of polyacetylene and iodine doped polyacetylene utilizing various conducting coatings and coating and tearing methods. The results show that the fibrillar morphology of polyacetylene does not change significantly with doping and that some coating and sample tearing methods can lead to spurious 'decoration' effects. (10 refs.)

118909 X-ray diffraction studies of iodine doped polyacetylene. P.Robin (Lab. Central de Recherches, Thomson-CSF, Orsay, France), J.P.Pouget, R.Comes, H.W.Gibson, A.J.Epstein.
J. Phys. Colloq. (France), vol.44, no.C-3, p.87-92 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
X-ray and synchrotron radiation diffraction study of the structure of cis and trans polyacetylene prepared by the Shirakawa method has been carried out. Studies of rapidly and slowly iodine doped samples confirmed that undoped regions of $(CH)_x$ remain. The undoped regions of the initially cis $(CH)_x$ are shown to isomerize to the trans structure during the doping process. (20 refs.)

118910 An X-ray investigation on cis-trans polyacetylenes. G.Perego, G.Lugli, U.Pedretti, E.Cernia (ASSORENI, Milano, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.93-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The formation of cis-trans mixed crystals in polyacetylene is demonstrated by X-ray diffraction data. (9 refs.)

118911 Synthesis and properties of $(CH)_x$-films prepared by polymerization of BTFM-TCDT. G.Leising (Inst. fur Festkorperphys., Stoffe Tech. Univ. Graz, Graz, Austria), F.Stelzer, H.Kahlert.
J. Phys. Colloq. (France), vol.44, no.C-3, p.139-42 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
$(CH)_x$-films were prepared by a ring-opening metathetical polymerization of 7,8-bis-(trifluoromethyl)-tricyclo-[4,2,2,0]-deka-3,7,9-triene (BTFM-TCDT). 100% trans-$(CH)_x$-films were obtained having a density considerably higher than the films prepared by the Shirakawa technique (1973). The authors present a study of the morphology by scanning-electron microscopy, of the infrared transmission, and of the conductivity before and after various doping procedures, and compare these results with properties of $(CH)_x$-films prepared by the Shirakawa technique. (3 refs.)

118912 A new form of polyacetylene. D.C.Bott, C.K.Chai (BP Res. Centre, Sunbury-on-Thames, England), J.H.Edwards, W.J.Feast, R.H.Friend, M.E.Horton.
J. Phys. Colloq. (France), vol.44, no.C-3, p.143-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors report the preparation and characterization of a new form of polyacetylene. This material appears to have a very low concentration of defects and to be largely amorphous; some aspects of its properties, in particular electrical behaviour (pristine and doped), are discussed. (9 refs.)

118913 Analogies between graphite intercalation compounds and doped polyacetylenes. S.Flandrois (Centre de Recherche Paul Pascal, Univ. de Bordeaux I. Talence, France), C.Hauw, B.Francois.
J. Phys. Colloq. (France), vol.44, no.C-3, p.523-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Graphite intercalation compounds are compared with doped polyacetylenes. It is shown that a number of analogies exist between both classes of materials, concerning, for example, the dopant species or the doping mechanism. Finally, a structure study of polyacetylene doped with iodine and sodium shows that doping may be considered as an intercalation reaction. (12 refs.)

118914 Characterization of polypyrrole. G.B.Street, T.C.Clarke, R.H.Geiss, V.Y.Lee, A.Nazzal, P.Pfluger, J.C.Scott (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.599-606 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Using β,β' dimethylpyrrole polymers to reduce the structural disorder it has been possible to interpret the results of electron diffraction data and to propose an idealized structure for neutral polypyrrole. XPS data have been used to define some of the deviations from this ideal structure that are seen in actual films and the origin of some of these defects is related to the mechanism of polymerization. The planarity of the chain structure is shown to be important for high conductivity in pyrrole polymers which appears to involve spinless carriers perhaps associated with bipolarons. (19 refs.)

118915 Structural changes in polyparaphenylene by the doping with AsF_5 and alkali metals. M.Stamm, J.Hocker (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.667-72 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Neutron scattering experiments have been performed on both doped and undoped polyparaphenylene (PPP) prepared by different methods. The structure of undoped PPP is refined and different structural models for doped PPP are discussed. (13 refs.)

118916 Molecular geometry of cis- and trans-polyacetylene by nutation NMR spectroscopy. C.S.Yannoni, T.C.Clarke (IBM Res. Lab., San Jose, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1191-3 (26 Sept. 1983).
The carbon-carbon bond lengths in polyacetylene have been directly measured with use of nutation NMR spectroscopy. 1.36 and 1.44 Å were found for the double and single bonds, respectively, in trans-$(CH)_x$, and 1.37 Å was found for the double bond in the cis isomer. Over the temperature range 4.2-300K, the dynamical single-double bond interchange predicted for chains in trans-$(CH)_x$ containing a mobile soliton defect was not observed. (16 refs.)

118917 Conformation of linear polymers in three dimensions. I.Majid, Z.V.Djordjevic, H.E.Stanley (Dept. of Phys., Boston Univ., Boston, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1282-5 (3 Oct. 1983).
By significantly extending the existing exact enumeration results, and by combining several independent analysis methods, the authors obtain accurate estimates of the leading 'scaling' exponent and the amplitudes for the $d=3$ linear-polymer radius-of-gyration problem. Specifically, they find that the mean square end-to-end distance of an *N*-step self-avoiding walk on an FCC lattice is given by the expression $\rho_N \sim AN^{2\nu}[1+B/N^{\Delta}+C/N]$ with $\nu \simeq 0.5875$, $\Delta \simeq 0.470$, $A \simeq 1.05$, $B \simeq -0.3/A$, and $C \simeq 0.25$. (10 refs.)

118918 Anionic polymerization of isoprene by the complexes oligoisoprenyllithium/tertiary polyamines in cyclohexane. III. Structural study of the polymers by ^1H NMR at 100 MHz. S.Dumas, J.Sledz, F.Schue (Lab. de Chimie Macromoleculaire, Univ. des Sci. et Tech. du Languedoc, Montpellier, France), S.Raynal, S.Bywater, D.J.Worsfold.
Polymer (GB), vol.24, no.10, p.1291-3 (Oct. 1983).
The microstructure of polyisoprene prepared anionically in the presence of catalytic amounts of *N,N,N′,N′*-tetramethylethylenediamine (TMEDA) and pentamethyldiethylenetriamine (PMDT) has been studied as a function of $r=$[TMEDA]/[living ends] and $r=$[PMDT]/[living ends]. No significant effect is observed for $r \leq 0.5$. The structure varies drastically for $r > 0.5$. The 4,3 addition increases mainly at the expense of the cis4,1 addition and a plateau is reached for $r \geq 1.0$. The results are discussed on the basis of the nature of the living species. (8 refs.)

118919 Structure and morphology of segmented polyurethanes. I. Influence of incompatibility on hard-segment sequence length. M.Xu, W.J.MacKnight, C.H.Y.Chen, E.L.Thomas (Dept. of Polymer Sci. & Engng., Univ. of Massachusetts, Amherst, MA, USA).
Polymer (GB), vol.24, no.10, p.1327-32 (Oct. 1983).
Separation of three polybutadiene/toluene diisocyanate/butane diol segmented polyurethanes by means of solvent extraction and the characterization of their fractions indicate that the molecules of the original polyurethanes are quite dissimilar in chemical composition and average hard-segment length. These polyurethanes are just blends of two fractions of segmented copolymer with very different average hard-segment content and average hard-segment length. For these polyurethanes, in addition to the segregation of the hard and soft segments, as expected usually for segmented copolymers, the segregation of macromolecules as a whole according to their composition should be considered in the interpretation of their morphology and properties and has been proved to be the origin of the existence of two hard-segment T_gs. This kind of compositional non-uniformity is the result of the poor compatibility between the components of the system. It should be a common phenomenon for segmented copolymers, but is especially obvious in the case of polybutadiene-containing polyurethanes owing to the extremely poor compatibility between their components. (18 refs.)

118920 Structure and morphology of segmented polyurethanes. II. Influence of reactant incompatibility. C.H.Y.Chen, R.M.Briber, E.L.Thomas, M.Xu, W.J.MacKnight (Polymer Sci. & Engng. Dept., Univ. of Massachusetts, Amherst, MA, USA).
Polymer (GB), vol.24, no.10, p.1333-40 (Oct. 1983).
For pt.I see ibid., vol.24, no.10, p.1327-32 (1983). By following the copolymerization of a model polyurethane system, HTPBD/2,6 (or 2,4)-TDI/BDO, by optical microscopy, it was found that initial reactant incompatibility was the key factor in determining the final morphology of bulk sample. Based on this finding and the results from the previous paper, models are proposed to describe the morphology during polymerization of this particular polyurethane system for several hard segment compositions where both macro-phase separation and micro-phase separation of reactants can occur during polymerization. The copolymerization of one seemingly compatible system, PPO-EO/MDI/BDO, which has been previously studied and commercially produced, was also followed by optical microscopy. In the size range which can be detected with an optical microscope using conventional optics, no heterogeneities were observable at the beginning of this reaction but phase separation was evident later in the reaction and can be explained by the presence of micro-phase separation of reactants. Globule and spherulite formation and the presence of multiple T_gs and T_ms observed by previous workers can be explained by the two levels of heterogenities present during polymerization. (38 refs.)

118921 Structure of dense cross-linked polymers of dimethacrylates and oligo-*n*-methacrylates. B.V.Ozerkovskii, V.D.Plotnikov, V.P.Roshchupkin.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1816-22 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The microtacticity of dense cross-linked polymers synthesized by radical polymerization of oligomeric dimethacrylates and oligo-*n*-methacrylates has been studied by IR-spectroscopy method, and the value of vibrational segment of the polymethacrylate chain in network polymer has been evaluated. The existence of microdomains with essentially different density of molecular packing was shown by molecular probe method. The influence of high pressures on the process of polymerization of dimethacrylates and on the structure of the polymer being formed was studied. (11 refs.)

118922 Temperature effect on domain structurization in segmented polyurethanes. B.Ya.Teitel'baum, E.T.Magdalev, T.A.Yagfarova, M.G.Zimina, N.P.Apukhtina.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1823-9 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The formation of domain structure and thermomechanical properties of polyesterurethane urea prepared by curing of prepolymer at 120° have been studied by X-ray and thermomechanical analysis methods. The organization of domain structure and heat-resistance of obtained X-ray-amorphous material can be essentially improved by heating up to temperatures above 120°. These facts are explained by kinetic limitation of structurization processes at the cure temperature and by the possibility of their continuation (up to the new limit) at higher temperature. The process is localized in microphase of domains and proceeds in conditions of high elasticity of material as a whole. During thermal perfectioning of the structure the crystallization of domains is also possible. (17 refs.)

61.50 CRYSTALLINE STATE

(inc. molecular motions in solids; for magnetic structure and spin systems, see 75.25)

118923 A simple rule for finding and distinguishing triplet phase invariants with values near 0 or π with isomorphous replacement data. J.Karle (Lab. for the Structure of Matter, Naval Res. Lab., Washington, DC, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.800-5 (1 Sept. 1983).
On the basis of some mathematical and physical characteristics of isomorphous-replacement experiments, it has been possible to derive a simple rule called R_{fiso} that permits the selection of those triplet phase invariants that have values close to zero or π. Test examples show that large numbers of invariants may be evaluated by means of R_{iso} with reliabilities that are potentially high, but depend, of course, on the reliability of the experimental data. In order to apply the rule, it is not necessary to know the chemical nature of the substituent atoms, their positions in the structure or their occupancy. The rule R_{iso} affords new insights into the interrelationships among isomorphous-replacement data and an alternative selection method to the use of the conditional joint probability distribution. A formula has also been derived for estimating the value of the cosine of triplet phase invariants for the native substance, $\cos(\phi_{\mathrm{hP}}+\phi_{\mathrm{kP}}+\phi_{(\bar{\mathrm{h}}+\bar{\mathrm{k}})\mathrm{P}})$, in terms of measured structure-factor magnitudes and structure-factor magnitudes associated with the contribution from substituent atoms. (11 refs.)

118924 On evaluating the standard deviation of U_{eq}. V.Schomaker, R.E.Marsh (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.819-20 (1 Sept. 1983).
For roughly isotropic and orthic cases the variance of U_{eq} is about one-sixth of the average of the variances of U_{11}, U_{22}, and U_{33}, i.e. only about one-half of what would be estimated on ignoring the covariances of the diagonal elements of U. (4 refs.)

118925 NMR studies of molecular motion and spin dynamics in TEA(TCNQ)$_2$. J.P.Travers, F.Devreux, M.Nechtschein (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1295-300 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Proton NMR line has been recorded at 250 MHz in the organic semiconductor TEA(TCNQ)$_2$ between 170 and 370K. The observation of several narrowings of the line provides clear evidence for the appearance of molecular motions. The nature of the different motions is obtained from computations. In particular, it is established that the TEA disorder is dynamic above 270K, while it is static below 205K. On the other hand, the analysis of proton nuclear relaxation time measurements data is briefly presented. An interpretation is given, which provides an estimate for the on-site electronic Coulomb interaction U. (15 refs.)

118926 Group-theoretical analysis of sodium nitrate nonrigid crystal. A.A.Korolev, V.P.Smirnov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.6-9 (Aug. 1983). In Russian.
At ~548K NO_3^- radicals of sodium nitrate begin to rotate. According to the permutation-inversion symmetry some more elements are to be included into the symmetry group of the crystal. Irreducible representations of this new group are considered. (5 refs.)

61.50C Physics of crystal growth

(for techniques of crystal growth and film deposition, see 81.10 and 81.15; for epitaxy, thin films, see 68.55; for whiskers, see 68.70)

118927 Simple conditions for the appearance of sustained oscillations in continuous crystallizers. G.R.Jerauld, Y.Vasatis, M.F.Doherty (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).
Chem. Eng. Sci. (GB), vol.38, no.10, p.1675-81 (1983).
Continuous crystallizers are known to exhibit sustained oscillations in solute concentration and size distribution. The usual stability analysis for mixed suspension, mixed product removal crystallizers is obscured by the use of dimensionless groups which not only depend upon the physical properties and control parameters in the problem but also depend upon the steady-state values of the state variables in the model. The authors introduce three new dimensionless groups for this problem which only depend upon physical properties and control parameters. These produce a stability plot which is simpler than previous attempts and lends itself to easy physical interpretation. (9 refs.)

118928 Melt growth and properties of B$_6$P crystals. G.A.Slack, T.F.McNelly, E.A.Taft (Res. & Dev., General Electric Co., Schenectady, NY, USA).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.1009-13 (1983).
The compound semiconductor boron subphosphide has, at low temperatures, an ideal stoichiometry of 6 boron atoms to 1 phosphorus atom. This unit cell contains $B_{12}P_2$ and has a density of 2.60 g/cm^3. It has been melted under inert gas pressure at 2120°C with very little loss of phosphorus. Data are presented on the diffusion coefficient of phosphorus, the refractive index, the band gap, and the optical absorption coefficient. Some optical data on B$_6$As are also given. (59 refs.)

118929 Influence of electrical fields on the nucleation of crystal growth in some cycloalcohols. M.Shablakh, L.A.Dissado, R.M.Hill (Chelsea Coll., Univ. of London, London, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1443-53 (Sept. 1983).
The lower cycloalcohols exist in more than one solid structural phase. In a recent investigation of the phase structure of the four cycloalcohols from cyclopentanol to cyclooctanol it was observed that time-dependent transformations between some of the phases occurred, and that at least one of these transformations was sensitive to the application of an electric field. Further field-sensitive transitions have since been observed and are reported. The effect is discussed in terms of a field-dependent nucleation of the growing phase. (10 refs.)

118930 Crystallization of TCNQ salts from acetonitrile in the presence of association equilibria. L.Komorowski, G.Malachowicz (Inst. of Organic & Phys. Chem., Tech. Univ. of Wroclaw, Wroclaw, Poland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1207-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Associations in the TCNQ$^-$/TCNQ system in acetonitrile have been indicated as a possible source of impurities in tetracyanoquinodimethanides crystallized from a solution. (5 refs.)

118931 Theory of crystal ordering: hexagonal symmetry. A.C.Mitus, A.Z.Patashinskii (Inst. of Nuclear Phys., Novosibirsk, USSR).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.31-4 (3 Oct. 1983).
Using the statistical-mechanics theory of crystal ordering, the case of the hexagonal symmetry of the local order parameter (the sixth-rank tensor) is studied. The crystals metastability interval is small: $E=0.04$. The phase diagram is constructed and the explanation of non-existence of mesophase in HCP crystals is proposed. (9 refs.)

61.50E Crystal symmetry; models and space groups, and crystalline systems and classes

118932 Finite subgroups of the group GL(n,Z). P.M.Gudivok, A.A.Kirilyuk, V.P.Rud'ko, A.I.Tsitkin.
Cybernetics (USA), vol.18, no.6, p.788-803 (Nov.-Dec. 1982). Translation of: *Kibernetika (USSR)*, vol.18, no.6, p.71-82 (Nov.-Dec. 1982). [received: Sept. 1983]
The authors present a study of finite subgroups of the complete linear GL(n,Z) (Z is the ring of rational integers) and their applications in multidimensional crystallography. (17 refs.)

118933 Moments of the trigonometric structure factor. U.Shmueli, U.Kaldor (Dept. of Chem., Tel-Aviv Univ., Ramat Aviv, Israel).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.615-21 (1 Sept. 1983).
The eighth moment of the magnitude of the trigonometric structure factor has been computed for all the space groups and all the reflection subsets giving rise to different functional forms of this quantity. This extension of previously published computations of lower moments permits the construction of four-term generalized distributions of normalized intensity, which are necessary in treating problems arising from highly heterogeneous atomic compositions in various spacegroup symmetries. The related problem of odd-even mixed partial moments of the trigonometric structure factor has also been investigated, and these mixed moments were found to vanish for all the three-dimensional space groups, confirming the correctness of the hitherto published theoretical statistics. Similar computations for the plane groups showed that non-zero values of the mixed partial odd-even moments are obtained for *p*3, *p*31*m*, *p*3*m*1, *p*6 and *p*6*m*. This result calls for some modifications of the statistical formalism to be applied to two-dimensional sets of intensity data. The modifications required for the centrosymmetric case are indicated in some detail. (25 refs.)

118934 Willis formalism of anharmonic temperature factors for a general potential and its application in the least-squares method. K.Tanaka, F.Marumo (Res. Lab. of Engng. Materials, Inst. of Technol., Yokohama, Japan).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.631-41 (1 Sept. 1983).
Willis treatment of anharmonic temperature factors including up to fourth-order terms has been generalized and incorporated into a conventional full-matrix least-squares program. The temperature factor $T(\mathrm{S})$ including the anharmonic vibration effect is formulated in the general case using Willis's method (1969) $T(\mathrm{S})$ is based on the Cartesian coordinates defined by the three principal axes of the harmonic thermal ellipsoid. The simultaneous refinement of the parameters in $T(\mathrm{S})$ with the conventional parameters in crystallography, which are based on the crystal lattice system, is possible. In order to introduce $T(\mathrm{S})$ into conventional full-matrix least-squares programs, some other relations were also derived, such as that between crystallographic symmetry and $T(\mathrm{S})$, and that among parameters due to point symmetry of the atom, and so on. The method was applied to the K and two F atoms in KCuF$_3$ crystals at 296K with the point symmetries of the sites 422, $\bar{4}2m$ and *mm*2, respectively, and Al and O atoms in α-Al$_2$O$_3$ crystals at 2170K with the point symmetries 3 and 2, respectively. (35 refs.)

118935 Bravais classes for incommensurate crystal phases. A.Janner, T.Janssen (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands), P.M.de Wolff.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.658-66 (1 Sept. 1983).
A full classification is given of the Bravais classes of lattice of symmetry groups of incommensurate crystal phases with an internal (additional) dimensionality *d* lower than four. These Bravais classes form the basis for the derivation of superspace groups needed for the symmetry classification of incommensurate crystal phases. By means of examples it is indicated how the information contained in the various tables can be extracted and used, for example, for the derivation of superspace groups. (13 refs.)

118936 Wyckoff positions used for the classification of Bravais classes of modulated crystals. A.Janner, T.Janssen (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands), P.M.de Wolff.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.667-70 (1 Sept. 1983).
Wyckoff positions of centrosymmetric symmorphic space groups, if properly interpreted, can be used to derive the Bravais classes of modulated crystals. This program is worked out for the incommensurate case and assuming that the modulation wave vectors are symmetry related, i.e. are (integral combinations of) vectors of one star. The corresponding classes are called elementary Bravais classes (EBCs). It is shown that for three-dimensional crystals the maximal internal dimension for these EBCs is nine. It is explained in what sense this approach leads to a complete list. (3 refs.)

118937 Determination of the Bravais class for a number of incommensurate crystals. A.Janner, T.Janssen (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands), P.M.de Wolff.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.671-8 (1 Sept. 1983).
For a number of incommensurate crystal phases with a one-dimensional modulation and for all those with a higher-dimensional modulation which are known to the authors, the Bravais class is determined. This is done partly to illustrate the use of the complete list of Bravais classes published in a previous paper [Janner, Janssen & de Wolff (1983). Acta Cryst. A39, 658-666] partly to give an overview of the crystals having higher-dimensional modulation. (24 refs.)

118938 Space-group frequencies for organic compounds. A.D.Mighell, V.L.Himes (Reactor Radiation Div., NBS, Washington, DC, USA), J.R.Rodgers.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.737-40 (1 Sept. 1983).
The space-group frequency for approximately 30000 organic compounds in the NBS Crystal Data Identification file has been calculated for each of the 230 space groups. 75% of the compounds have been reported in only five space groups: $P2_1/c$ (36.0%), $P\bar{1}$ (13.7%), $P2_12_12_1$ (11.6%), $P2_1$ (6.7%) and $C2/c$ (6.6%). In contrast, there are 29 space groups with only one entry and 35 space groups with none at all. Although the space-group frequencies should be fairly representative of their distribution in nature, certain frequencies are over- or underestimated. An analysis of the metric symmetry for about 30000 lattices using a matrix technique has revealed that it is not uncommon for the metric symmetry to exceed the reported crystal symmetry. (10 refs.)

118939 A reformulation of the basis of crystal physics. R.R.Birss (Dept. of Pure & Appl. Phys., Univ. of Salford, Salford, England).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.747-53 (1 Sept. 1983).
The basis of crystal physics, namely the classification of tensors by rank and according to parity (i.e. polar or axial) is closely examined and found to be fundamentally deficient. An appreciation of the importance of a pre-metrical approach that stresses the role of invariant objects leads to a superior description in terms of differential forms. Rank is then replaced by the degree of the form and parity is replaced by a distinction between inner and outer orientation. It is shown how these factors can be used to predict the behaviour of physical properties under active inversion, which is then the operation of fundamental importance. (30 refs.)

118940 The effect of random errors on partially phased Fourier maps. W.Jauch (Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.756-61 (1 Sept. 1983).
Probability methods are used to investigate the effect of random errors on partially phased Fourier maps of non-centrosymmetric structures. Two sources of error are considered: (i) inaccuracies in the atomic coordinates of the phasing model; (ii) errors in the observed structure-factor magnitudes. Expressions for both the error level in the unit cell and the peak heights at the atomic positions are derived. The results are illustrated for neutron diffraction studies of proteins. (10 refs.)

118941 A varying-step algorithm for numerical integration of Takagi-Taupin equations. Y.Epelboin (Univ. Pierre et Marie Curie, Paris, France).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.761-7 (1 Sept. 1983).
The numerical integration of the Takagi-Taupin equations using a constant step of integration does not allow the simulation of traverse topographs since the accuracy of the computation is rather poor. A new algorithm is described in which the step of integration varies inside the crystal, following the oscillations of the amplitudes of the wavefields. The precision becomes good enough to simulate either section topographs, taking into account the real width of the incident beam, or traverse topographs. (16 refs.)

118942 Extrapolative filtering. II. Formalism for a maximum-entropy enhancement of resolution in *n* dimensions. D.M.Collins, M.C.Mahar (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.777-83 (1 Sept. 1983).
For pt.I see ibid, vol.34, p.533 (1978). An extrapolative filtering formalism is used to determine a high-resolution positive-definite density estimator. In an example, comparison with results from Fourier transformation of structure factors shows a resolution enhancement factor of 1.3 for the density estimator. The density estimator satisfies a maximum-entropy criterion and is the direct-space representation of a maximum determinant of structure factors as used in phase determination. (14 refs.)

118943 Unbiased three-dimensional refinement of heavy-atom parameters by correlation of origin-removed Patterson functions. T.C.Terwilliger, D.Eisenberg (Dept. of Chem., Univ. of California, Los Angeles, CA, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.813-17 (1 Sept. 1983).
A procedure is presented for three-dimensional refinement of heavy-atom parameters without the use of phase information in the methods of single and multiple isomorphous replacement. This procedure is based on the Patterson-function correlation method of Rossmann [Acta Cryst. (1960), 13, 221-6] except that the origins of the Patterson functions are now removed from this correlation and centric and acentric reflections are treated separately. The resulting procedure is shown theoretically and by application to three test cases to yield accurate and essentially unbiased estimates of the occupancies, thermal parameters, and positions of heavy-atom sites. 118944 Graphical enumeration of polyhedral clusters. F.C.Hawthorne (Dept. of Earth Sci., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.724-36 (1 Sept. 1983).
The following hypothesis is proposed: crystal structures may be ordered or classified according to the polymerization of those coordination polyhedra (not necessarily of the same type) with the higher bond valences. The linkage of polyhedra to form clusters is considered from a graph-theoretic viewpoint. Polyhedra are represented by the chromatic vertices of a (labelled) graph, in which different colours indicate coordination polyhedra of different type. The linking together of polyhedra is denoted by the presence of an edge or edges between vertices representing linked polyhedra, the number of edges between two vertices corresponding to the number of corners (atoms) common to both polyhedra. 118945 Anion ordering in $(TMTTF)_2ReO_4$: a displacive transition. S.S.P.Parkin, J.J.Mayerle, E.M.Engler (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1105-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have synthesized single crystals of $(TMTTF)_2ReO_4$ and find this compound undergoes an anion order-disorder transition near 160K at 1 bar, involving the formation of a 2×2×2 superlattice, resulting in a metal-insulator transition. They have carried out a complete determination of the crystal structure in the anion ordered phase. They find the ReO_4 anions are displaced out of the plane of the anion array towards the neighbouring TMTTF molecule, with a considerable reduction in the closest O-S bond distance. This behaviour may provide an explanation for the very large energy gap observed in the insulating phase, and strongly suggests the anion order-disorder transition is driven by the anion array and not the host organic material. (11 refs.)

118946 Polymorphic phase transitions in alkali cyanide crystals. R.W.Impey, S.Nose, M.L.Klein (Div. of Chem., Nat. Research Council of Canada, Ottawa, Ontario, Canada).
Mol. Phys. (GB), vol.50, no.1, p.243-6 (Sept. 1983).
The authors have presented the results of a preliminary study of the polymorphic transition in solid KCN using the NMD method. They have demonstrated that structural phase transformations in solids can be observed with modest amounts of computer time. (17 refs.)

118947 Calculation of the properties and the structure of ordering alloys of the Cu-Au system. S.F.Kolodeznaya, E.V.Kozlov (Civil Engng. Inst., Tomsk, USSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.131-9 (1 Sept. 1983).
By using the method of OPW-pseudopotential (OPW-PP) the ordering energy of copper-gold alloys, the short-range and long-range order structures, and the transition temperaure are calculated. In many parameters the calculated values are in good agreement with the experimental ones. The level of approximation and the ways of the further development of the theory are discussed. (35 refs.)

118948 The bonding properties of mercury-cadmium telluride. W.A.Harrison (Appl. Phys. Dept., Stanford Univ., Stanford, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1672-3 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Recently developed bonding theory, applied to HgTe and CdTe predicts the elastic and plastic rigidity of the two compounds relative to each other and relative to silicon. (3 refs.)

118949 Characteristics of the crystals of derivatives of $12CaO.7Al_2O_3$. G.I.Zhmoidin, G.S.Smirnov (A.A. Baikov Inst. of Metall., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1595-601 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1856-62 (Nov. 1982).
In the isomorphous series of derivatives of the compound $12CaO.7Al_2O_3$ the degree of covalence of the bond increases by 8.5 rel.% in the direction $2F^- < 2(OH^-) < O^{2-} < S^{2-}$. In the calculation of the material balance and the balance of the refractions for the actually obtained crystals of $12CaO.7Al_2O_3$ it was found that in one formula unit 0.25 mole of CaO is substituted by 0.25 mole of $Ca(OH)_2$ and 0.05 mole of O_2. The variation in the covalence of the bond within the investigated isomorphous series correlates well with the variation in the microhardness, which increases in the crystals $11CaO.7Al_2O_3.CaF_2 < 12CaO.7Al_2O_3 < 11CaO.7Al_2O_3.CaS$ from 720 to 110×10^7 Pa. On the basis of the obtained relationships conclusions were reached about the change in structure during fusion and glass formation in the $12CaO.7Al_2O_3$ crystal and about the characteristics of the hypothetical

anhydride crystal of 12 $CaO.7Al_2O_3$, a distinctive feature of which must be the decrease in the refractive index from 1.608 to 1.601. (7 refs.)

118950 Metal-metal bonding with reduced halides and halide carbides of rare earth metals. A.Simon (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.369-70 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Special aspects of a d metal chemistry of low valent lanthanide halides (metal clusters, condensed clusters, heteroatoms in clusters) are discussed. (15 refs.)

118951 Cohesive energy of MAX compounds (M=Ca, Sr, Ba; A=H, F; X=Cl, Br, I) of PbFCl structure. M.Sieskind, M.Ayadi (Univ. Louis Pasteur, Strasbourg, France).
J. Solid State Chem. (USA), vol.49, no.2, p.188-94 (Sept. 1983). In French.
The Madelung constant, the electrostatic and repulsive energies of the compounds MAX, with the PbFCl structure ($D_{4h}{}^7$), are calculated and compared with the experimental Van de Waals energy. The special case of CaHBr is discussed. (10 refs.)

118952 Semiempirical studies of core electron binding energies. II. SCC-MO calculations for uracil and its derivatives. Z.B.Maksic, K.Rupnik (Theoretical Chem. Group, Rudjer Boskovic Inst., Zagreb, Yugoslavia), A.Veseli.
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.163-75 (Sept. 1983).
The solid-state binding energies of uracil and some of its derivatives have been calculated using semiempirical SCC-MO intramolecular potentials expressed in the point-charge approximation. The results are essentially in satisfactory agreement with experimental data, giving at the same time a simple and transparent interpretation of the mental data, giving at the same time a simple and transparent interpretation of the ESCA spectra which is close to that suggested by chemical intuition. Splitting of some unresolved N 1 *s* peaks is proposed, and separate binding energies are attributed to particular nitrogen atoms. The relaxation energies are discussed briefly. The present and earlier evidence indicates that formal atomic charges are meaningful within the theoretical framework adopted, despite the fact that they cannot be defined in a unique fashion. (29 refs.)

118953 Van der Waals interactions between metallic chains versus Madelung energy of the charge transfer. a.Bjelis (Inst. of Phys., Univ. of Zagreb, Zagreb, Yugoslavia), S.Barisic.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1539-42 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors introduce the notion of the Van der Waals energy between the metallic chains and show that it can stabilize the TTF-TCNQ lattice, in spite of the Madelung energy which favorizes the HMTTF-TCNQ lattice. (7 refs.)

118954 Progress in cohesive energies, and in building organic unimolecular rectifiers. R.M.Metzger, C.A.Panetta (Dept. of Chem., Univ. of Mississippi, MS, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1605-11 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
From enthalpies of formation (semi-micro combustion calorimetry) and from other experimental Born-Haber cycle data, one obtains that crystalline sodium TCNQ, naphthalene TCNQ, anthracene TCNQ, TMPD TCNQ, and TTF TCNQ are more stable than their constituent neutral solid components, but that their stacking mode (segregated, mixed) and ionicity must be determined by the interplay between the cost of ionization and the various theoretical lattice energies (Madelung, polarization, dispersion, etc.). A current project will test the proposal by Aviram (1974), Ratner (1974), et al. that a molecule D-σ-A (D=donor, A=acceptor, σ=covalent sigma bridge) may be a unimolecular organic electrical rectifier. TTF has been successfully linked to TCNQ by a urethane bond; preliminary chemical results are reported. (64 refs.)

118955 Use of Harrison's potential in mixed alkali halide crystals. G.D.Jain, J.Shanker (Dept. of Phys., Agra Coll., Agra, India).
Phys. Status Solidi b (Germany), vol.119, no.1, p.79-82 (1 Sept. 1983).
Harrison's (1981) overlap repulsive potential is used for evaluating the cohesive energies and bulk modulus of alkali halide mixed crystals. This potential replaces the old and widely used Born-Mayer repulsive potential in ionic crystals. The Harrison repulsive potential is presented by a quantum mechanical analytical potential form derived from the tight binding theory. The calculations are performed for the mixed crystals of NaCl-NaBr, KCl-KBr, and KBr-KI for the entire range of composition. The results are found in good agreement with experimental data and are better than those predicted from the Born-Mayer potential. (10 refs.)

118956 Monte Carlo determination of long-range pair interaction energies from diffuse scattering of X-rays by alloys. Yu.S.Stark, A.S.Steinberg, V.M.Vasilev, V.I.Dimitrov (Dept. of Theoretical Phys., Moscow Inst. of Steel & Alloys, Moscow, USSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.147-51 (1 Sept. 1983).
A method for the determination of the long-range interparticle interaction energies in alloys from the experimentally measured short-range order parameters is presented. This way of determining which is based on the Monte Carlo Method is applied to the problem of calculating the first five pair interaction energies in Cu_3Au. The results are compared with those obtained through the analytical theories of ordering. (19 refs.)

118957 Long-period ordering in intercalated compounds. Yu.R.Zabrodskii, K.A.Katrunov, V.M.Koshkin (V.I. Lenin Polytech. Inst., Kharkov, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.522-4 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.908-10 (March 1983). [received: Oct. 1983]
One of the interesting effects observed in intercalated compounds of complex crystals is long-period ordering of the intercalated atoms and molecules both in the planes of the host crystal layers and in the perpendicular direction. The authors consider a one-dimensional Ising model of an intercalated compound. The existence of long-period superlattices gives rise to the quantum size effect and to the formation of a mini-band electron spectrum. (9 refs.)

61.55D Nonmetallic elements

118958 Precision interplanar spacing measurements of boron-doped silicon. D.A.Werner Soares (Escola Federal de Engenharia de Itajuba, IBA, Itajuba, Brazil), C.A.Pimentel.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.486-92 (1 Oct. 1983).
A study of the lattice parameters of boron-doped silicon (10^{14}-10^{19} cm^{-3}) grown in ⟨111⟩ and ⟨001⟩ directions by the Czochralski technique has been undertaken. Interplanar spacings (d) were measured by the pseudo-Kossel technique to a precision of 0.001%; different procedures to obtain d and the errors are discussed. The crystallographic planes are found to contract preferentially and the usual study of parameter variation must be made as a function of d. The diffused B particularly contracts the {333} plane, which is more pronounced in high concentrations. An orientation dependence of the diffusion during growth was observed. (26 refs.)

61.55F Metallic elements

118959 X-ray diffraction study of californium metal to 16 GPa. J.R.Peterson (Inst. fur Heisse Chem., Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), U.Benedict, C.Dufour, I.Birkel, R.G.Haire.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.353-6 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The first series of measurements to determine the structural behavior of californium metal under pressure is reported. The initial double-hexagonal close-packed (d.h.c.p.) structure transformed sluggishly with increasing pressure to an f.c.c. structure. A bulk modulus of 50±5 GPa was derived for d.h.c.p. californium metal from the data for the relative volumes V/V_0 at pressures up to 10 GPa. (7 refs.)

118960 The local atomic order of a Ni-12.7 at.% Al alloy quenched from 1323K. J.E.Epperson (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany), P.Furnrohr.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.740-6 (1 Sept. 1983).
High-angle X-ray diffuse scattering has been measured in a volume element in reciprocal space for a Ni-12.7 at.% Al alloy single crystal quenched from 1323K. The Cowley-Warren order parameters were determined after separation of the first- and second-order size effects, using a procedure based on the Borie-Sparks quadratic approximation of atomic displacements. The experimental order coefficients were used to reconstruct the real-space locally ordered distribution of atoms, from which the spectrum of nearest-neighbor atomic configurations was determined. Some 61% of Al atoms were found to be in a planar ordered configuration consisting of a nickel atom and four nearest-neighbor aluminium atoms, the basic structural unit of Ni_3Al. (24 refs.)

118961 Crystal structure of RENiSn and REPdSn (RE≡rare earth) equiatomic compounds. A.E.Dwight (Dept. of Phys., Northern Illinois Univ., DeKalb, IL, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.411-13 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The crystal structures of 19 ternary compounds were investigated by X-ray powder diffraction. The alloys were of (Re,Y)NiSnk and REPdSn (RE≡rare earth) equiatomic composition. The TiNiSi-type structure (oP12) was found. (3 refs.)

118962 Quantum theory of ordered alloys of transition and noble metals. E.V.Kozlov, V.M.Dement'ev (Tomsk Civil-Engng. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.12, p.1122-35 (Dec. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.12, p.63-78 (Dec. 1982). [received: Oct. 1983]
The authors aim to outline the fundamentals of a quantum theory of ordered solid solutions of transition and noble metals. The aim of the theory, in particular, is to calculate the mixing energy (the energy difference between

the pure components and the completely disordered alloy), the specific energy of ordering (the energy difference between the completely disordered and the completely ordered alloy), the pair and multiparticle energy of ordering, the type of superstructure forming and the type short-range order, the parameters of the electron phonon systems, the physical properties, etc. The theory is based on the OPW PP method. 61.60 SPECIFIC STRUCTURE OF INORGANIC COMPOUNDS

118963 The experimental determination of phases of reflections from mosaic crystals. I. $ZnWO_4$. Ping Po Gong, B.Post (Phys. Dept., Polytech. Inst. of New York, New York, NY, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.719-24 (1 Sept. 1983).
The signs of large numbers of phases of reflections from centrosymmetric crystals of $ZnWO_4$ have been determined by methods outlined by Post [Acta Cryst. (1979), A35, 17-21; (1983), A39, 711-718]. Fifty-three *n*-beam interactions were selected to illustrate the phase determination procedure. Methods of extracting three-beam phase information from such interactions are discussed and illustrated. (7 refs.)

118964 New calcium gallates of lanthanum and neodymium. A.A.Ismatov, Sh.Yu.Azimov, T.A.Ismatov (A.R. Beruni Tashkent Polytech. Inst., Tashkent, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1601-3 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1863-5 (Nov. 1982).
The gallium-containing analogs of helenite $CaLaGa_3O_7$ and $CaNdGa_3O_7$ were synthesized. It was established that their physical characteristics (density, resistivity, thermal expansion coefficient, etc.) and crystal-chemical characteristics (crystal habit, unit cell parameters and size) depend on the nature of the rare-earth element. (5 refs.)

118965 Unit-cell parameters of titanium oxynitrides. S.V.Gurov, V.N.Troitskii, V.I.Torbov, V.V.Kireiko (Inst. of New Chemical Problems, Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1489-92 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1733-5 (Oct. 1982). [received: Sept. 1983]
The formation of oxynitride phases on sintering highly dispersed titanium nitride obtained by the plasmochemical method leads to a decrease in the unit-cell parameter from 0.4245 to 0.4236 nm in the initial stage of oxidation (up to oxygen contents within 5 mass %), due to the replacement of nitrogen by oxygen in the oxynitride with a stoichiometric ratio of nonmetal to metal. (10 refs.)

118966 Crystal data for $Rb_2CoCl_4.2H_2O$. J.Hybler, M.Havrankova (Inst. of Phys., Acad. of Sci., Praha, Czechoslovakia).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.575 (1 Oct. 1983).
Summary form only given, as follows. This compound is triclinic, probably isostructural with $Rb_2MnCl_4.2H_2O$, the space group is $P1$ or $P\bar{1}$, $a=6.50\pm0.04$, $b=6.99\pm0.04$, $c=5.58\pm0.03$ Å, $\alpha=92.8\pm0.1°$, $\beta=97.2\pm0.1°$, $\gamma=65.4\pm0.1°$, $V=228.76\pm0.06$ Å^3, $Z=1$, $D_m=2.94\pm0.03$, $D_x=2.96$ g cm^{-3}. The precession method and Zr-filtered Mo $K\alpha$ radiation ($\lambda=0.7107$ Å) were used. The specimen preparation, chemical analysis, morphology and a comparison with similar substances are given. (no refs.)

118967 Crystal data for magnesium decavanadate, $Mg_3V_{10}O_{28}.28H_2O$. G.Rigotti, M.E.Escobar, E.J.Baran (Facultad de Ciencias Exactas, Univ. Nacional de La Plata, La Plata, Argentina).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.575 (1 Oct. 1983).
Summary form only given, as follows. Crystal data for $Mg_3V_{10}O_{28}.28H_2O$ were determined from oscillation, Weissenberg and precession photographs using Cu $K\alpha$ radiation ($\lambda=1.54178$ Å). The substance is triclinic, space group $P\bar{1}$, $Z=2$, and lattice constants $a=10.53$ (5), $b=10.73$ (6), $c=21.28$ (9) Å, $\alpha=90.2(1)$, $\beta=97.5$ (2) and $\gamma=104.1(3)°$, $V=2310$ (25) Å^3 and the measured and calculated densities are 2.17(10) and 2.20 Mg m^{-3}, respectively. The crystals were also characterized by TG/DTA measurements and vibrational spectroscopy. (no refs.)

118968 Crystal data for $CuGa_xIn_{1-x}Te_2$. B.Grzeta-Plenkovic, B.Santic (Ruder Boskovic Inst., Zagreb, Yugoslavia).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.576 (1 Oct. 1983).
Summary form only given, as follows. A series of samples in the system $CuGa_xIn_{1-x}Te_2$, $0\leq x\leq1$, has been synthesized and characterized by X-ray diffraction. All the samples have a chalcopyrite-type structure, the unit-cell parameters a and c and the ratio c/a changing linearly with x. The unit-cell parameters for the compounds with $x=1$, 0.80, 0.65, 0.50, 0.30, 0.15 and 0 and the pwder diffractometer data for $x=1$, 0.5 and 0 are given at 298K. $CuGaTe_2$: $a=6.021(2)$, $c=11.937(5)$ Å, $V=432.75$ Å^3, $D_x=5.96$ g cm^{-3}: $CuGa_{0.80}In_{0.20}Te_2$; $a=6.053(2)$, $c=12.039(4)$ Å, $V=441.09$ Å^3, $D_x=5.99$ g cm^{-3}: $CuGa_{0.65}In_{0.35}Te_2$; $a=6.084(2)$, $c=12.107(7)$ Å, $V=448.14$ Å^3, $D_x=5.99$ g cm^{-3}; $CuGa_{0.50}In_{0.50}Te_2$: $a=6.107(2)$, $c=12.177(7)$ Å, $V=454.15$ Å^3, $D_x=6.01$ g cm^{-3}; $CuGa_{0.30}In_{0.70}Te_2$: $a=6.144(2)$, $c=12.296(7)$ Å, $V=464.16$ Å^3, $D_x=6.01$ g cm^{-3}; $CuGa_{0.15}In_{0.85}Te_2$: $a=6.168(3)$, $c=12.355(10)$ Å, $V=470.04$ Å^3, $D_x=6.03$ g cm^{-3}; $CuInTe_2$: $a=6.195(2)$, $c=12.418(6)$ Å, $V=476.58$ Å^3, $D_x=6.04$ g cm^{-3}. The JCPDS Diffraction File Nos. are; 34-1500 for $CuGaTe_2$; 34.1498 for $CuInTe_2$: 34-1499 for $CuGa_{0.50}In_{0.50}Te_2$. (no refs.)

118969 Crystal data for two orthophosphates: α-$NaCuPO_4$ and β-$AgCuPO_4$. M.Quarton, M.T.Oumba (Lab. de Chimie Minerale, Univ. Pierre et Marie Curie, Paris, France), A.W.Kolsi.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.576-7 (1 Oct. 1983).
Summary form only given, as follows. Two orthophosphates M^ICuPO_4 (with M^I=Na or Ag) have been synthesized by solid-state reaction between M_3PO_4 and $Cu_3(PO_4)_2$. Each of these compounds undergoes a phase transition and high temperature, and for $AgCuPO_4$ the polymorphic transformation is irreversible. α-$NaCuPO_4$ (low temperature) is orthorhombic, $P2_12_12_1$, a=9.7098(8), b=4.8040(3), c=7.1676(6) Å, V-334.34(7) Å^3, D_m(298K)=3.55, D_x=3.606 Mg m^{-3}, Z=4. β-$AgCuPO_4$ (high temperature) is orthorhombic, Pbca, a=7.5008(6), b=15.749(1), c=5.7030(5) Å, V=673.70(14) Å^3, D_m(298K)=5.25, D_x=5.253 Mg m^{-3} for Z=8. Powder diffraction data have been obtained at 293K with a counter diffractometer with Ni-filtered copper radiation ($\lambda=1.5418$ Å). The JCPDS Diffraction File Nos. are: 34-1496 for β-$AgCuPO_4$; 34-1497 for α-$NaCuPO_4$. (no refs.)

118970 X-ray diffraction and absorption spectrophotometric studies of AmI_3 and AmOI. R.G.Haire (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), J.P.Young, J.R.Peterson.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.339-45 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The anhydrous tri-iodides and the oxyiodide of americium were investigated by X-ray diffraction and absorption spectrophotometry. From the X-ray analysis of the tri-iodide, an orthorhombic form ($PuBr_3$-type structure) was identified, which is isostructural with the lighter actinide (uranium through plutonium) tri-iodides. A hexagonal form (BiI_3-type structure) of the tri-iodide was also found. The transition temperature for converting the orthorhombic form to the hexagonal form was established to be 400±30°C. Room temperature lattice parameters for the tri-iodide are (1) $a_0=0.428(4)$ nm, $b_0=1.394(1)$ nm and $c_0=0.9974(7)$ nm for the orthorhombic form, and (2) $A_0=0.7637(4)$ nm and $c_0=2.091(2)$ nm for the hexagonal form. The room temperature parameters for the tetragonal oxyiodide (PbFCl-type structure) are $a_0=0.4010(4)$ nm and $c_0=0.9200(6)$ nm. From differences in the absorption spectra of the solids at 25°C, it is possible to differentiate between these three materials by absorption spectrophotometry. (14 refs.)

118971 K_2UCl_5, Rb_2UCl_5, UCl_3 and a comparison with analogous rare earth chlorides. G.Meyer, H.-C.Gaebell, R.Hoppe (Inst. fur Anorganische und Analytische Chem., Justus-Liebig-Univ., Giessen, Germany).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.347-51 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
K_2UCl_5 and Rb_2UCl_5 crystallize isotypically with K_2PrCl_5 (orthorhombic structure; space group, Pnma; Z=4). Monocapped trigonal prisms $[UCl_7]$ are connected via two common edges to chains $[UCl_5]^{2-}$ in the [010] direction. The lattice constants and molar volumes suggest that the uranium chlorides should be compared with the analogous cerium compounds. The crystal structure of UCl_3 was refined from single-crystal data. (17 refs.)

118972 Syntheses, lattice parameters and solid state absorption spectra of the first five transplutonium orthophosphates. R.G.Haire (Transuranium Res. Lab., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), H.E.Hellwege, D.E.Hobart, J.P.Young.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.358-9 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given. Studies of the orthophosphates of the first five transplutonium elements consisted of three phases: (1) their synthesis and characterization; (2) an examination of their stability toward self-irradiation; (3) a determination of the chemical and structural consequences of radioactive decay on the progeny (i.e. $Es(PO_4)\rightarrow BkPO_4\rightarrow CfPO_4$ etc.). The first phase of these studies has been completed. The crystal form, lattice parameters (except for $EsPO_4$), solid state absorption spectra and Raman spectra have been determined for these five actinides. From the data obtained it has been possible to make a systematic comparison of the basic properties of the lanthanide and transplutonium orthophosphates. The transplutonium orthophosphates were found to be isostructural with the lighter lanthanide orthophosphates (monoclinic monazite structure). Their room temperature absorption spectra confirmed that the actinides were trivalent and the spectrum for each orthophosphate exhibited sharp f-f transitions that were characteristic for each metal ion in this structural environment.

118973 Reduced ternary rare earth halides: state of the art. G.Meyer (Inst. fur Anorganische und Analytische Chem., Justus-Liebig-Univ., Giessen, Germany).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.371-80 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Since the first discovery of Gd_2Cl_3 in 1964, a plethora of reduced binary rare earth halides with formal oxidation states less than 2+ has been obtained. Their common structural feature is an M_6 metal cluster surrounded by halide ions and, whenever necessary, edge connected. At present this appears to have no analogy in reduced ternary rare earth halide chemistry. Compounds with the oxidation state 2+ have been obtained for europium, ytterbium, samarium, thulium, dysprosium and scandium. The formula types AMX_3, A_2MX_4 and AM_2X_5 have been observed. AMX_3 compounds are either of the perovskite type (e.g. cubic $CsTmCl_3$ or $RbTmCl_3$ with three modifications and two transitions near 185 and 375°C) or isotypic with $CsNiCl_3$ (scandium (II) halides $AScX_3$ with A≡Cs, Rb, X≡Cl, Br and $CsScI_3$). A_2MX_4 compounds (examples are Cs_2YbCl_4 and Cs_2TmCl_4) are isostructural with K_2NiF_4 which is related to the perovskite structure. Samarium(II) and europium(II) halides of the AM_2X_5 type (e.g. KSm_2Cl_5) are structurally closely related to K_2SmCl_5. In KSm_2Cl_5 (equivalent to $KSm[SmCl_5]$) samarium(II) has coordination numbers of 8 and 7. The successful synthesis of ternary scandium(II) halides gave a first indication that there is a possibility of producing ternary reduced halides with other than the four classical divalent rare earths. (38 refs.)

118974 Solid state chemistry of rare earth compounds with homogeneously and heterogeneously mixed valence. E.Kaldis (Lab. fur Festkorperphys., Zurich, Switzerland).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.381-2 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
An overview of some chemical properties of the mixed valence compounds is given, with reference to recent publications. (6 refs.)

118975 The search for a trivalent thulium monotelluride. E.Kaldis, E.Jilek, H.Spychiger (Lab. fur Festkorperphys., Eidgenossiche Tech. Hochschule Zurich, Zurich, Switzerland).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.399-409 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The existence of a $Tm^{3+}Te$ ($(4f)^{12}$) compound with the NaCl structure and the lattice constant $a=604$ Å has been reported several times in the literature for polycrystalline samples. Single crystals of pure $Tm^{2+}Te$ ($(4f)^{13}$) grown from the melt at 1950°C also have the NaCl structure but the lattice constant is much larger ($a=6.36$ Å). The authors investigate the possibility of changing the valence in TmTe by varying the stoichiometry. X-ray and chemical analyses show that the Tm^{3+} monotelluride is strongly deficient in thulium, has the Sc_2S_3 superstructure of the NaCl lattice and has the composition $Tm_{0.68}Te$ ($TmTe_{1.47}$). Density and magnetic susceptibility data support this result and show the trivalent character of thulium. The compound is stable at both low and high temperatures so that single crystals can be grown at $T\leq2000°C$. This phase is the only reaction product of the elements at $500°C\leq T\leq800°C$. They believe that the Sc_2S_3 superstructure has not been recognized in the past because of the very low intensity of the extra reflections in the X-ray film. The transition from $Tm^{2+}Te$ to ${Tm^{3+}}_{0.68}Te$ takes place via a miscibility gap and a slightly deformed NaCl structure (contrac-

tion along the diagonal owing to the increasing Tm^{3+} contribution) with a rhombohedral cell and lattice constants $a \approx 6.145$ Å and $\alpha \approx 89.08°$. (22 refs.)

118976 Anion ordering in europium(II) mixed halide systems: preparation of mixed cation fluoride halides. S.A.Hodorowicz, E.K.Hodorowicz, H.A.Eick (Michigan State Univ., East Lansing, MI, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.415-18 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The results of phase studies of EuX_2-EuX'_2 systems, where X and X′ represent the halogens chlorine, bromine and iodine, are presented and compared with previous studies of related divalent systems. All systems exhibit the $PbCl_2$-type structure over a limited intermediate composition range. In every reported study but one the anions in the $PbCl_2$-type structure region are found to be ordered, with the smaller anion occupying the tetrahedral hole. The complexity of the systems is found to correlate well with the effective size difference between the anions and the cation. Lattice parameter data for three mixed cation PbFCl-type fluoride halides are presented. (11 refs.)

118977 Synthesis and structure of $Gd_2(CO_3)_3.nH_2O$ (n=2,3). A.Sungur, M.Kizilyalli (Dept. of Chem., Middle East Tech. Univ., Ankara, Turkey).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.419-23 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
A modified procedure was used to prepare crystalline gadolinium carbonate via the hydrolysis of gadolinium trichloroacetate. Although the X-ray diffraction data obtained were almost identical with published data, there were about 25 extra diffraction lines. The powder data were indexed in the orthorhombic system with $a=6.15 \pm 0.01$ Å, $b=9.29 \pm 0.01$ Å and $c=15.26 \pm 0.01$ Å and the space group was either $I222$ or $I2_12_12_1$. The structure is closely related to those of $Er_2(CO_3)_3.2.25H_2O$ and $Ho_2(CO_3).2.25H_2O$ and does not fit the data for $Gd_2(CO_3)_3.2.58H_2O$ reported in the literature. The IR data for gadolinium carbonate show the presence of two different carbonate groups. (23 refs.)

118978 $Ln_2\mathrm{BaZnO}_5$ and $Ln_2\mathrm{BaZn}_{1-x}\mathrm{Cu}_x\mathrm{O}_5$: A series of zinc oxides with zinc in pyramidal coordination. C.Michel, B.Raveau (Univ. Caen, Caen, France).
J. Solid State Chem. (USA), vol.49, no.2, p.150-6 (Sept. 1983).
A series of zinc oxides $Ln_2\mathrm{BaZnO}_5$ has been synthesized for Ln=Sm, Eu, Gd, Dy, Ho, and Y. These phases are orthorhombic and isostructural with the copper compounds $Ln_2\mathrm{BaCuO}_5$ previously described, as shown from the structural study of one member Y_2BaZnO_5. In this structure, whose framework is built up from edge- and face-sharing $Ln\mathrm{O}_7$ polyhedra, the Zn^{2+} ions exhibit an unusual pyramidal coordination ZnO_5. The solid solution $Y_2BaZn_{1-x}Cu_xO_5$ has been studied by infrared spectroscopy and electron spin resonance (ESR). The distorted square-based pyramidal configuration of Zn^{2+} and Cu^{2+} is confirmed. The ESR spectra of diluted samples exhibit a hyperfine structure and are typical of individual Cu(II) ions. For higher Cu(II) contents, they exhibit an anisotropic broad signal which is interpreted in terms of Cu-Cu interactions. (27 refs.)

118979 Single crystal X-ray study of Mo_6Se_8-type selenides containing partially substituted $(\mathrm{Mo},Me)_6$ clusters (Me=Ru, Re). W.Honle, H.D.Flack, K.Yvon (Univ. de Geneve, Geneve, Switzerland).
J. Solid State Chem. (USA), vol.49, no.2, p.157-65 (Sept. 1983).
Atomic coordinates for rhombohedral $Mo_4Ru_2Se_8$ and $Mo_{\sim 1.5}Re_{\sim 4.5}Se_8$ are reported. The metal atom octahedra (point symmetry $\bar{3}$) are significantly smaller and less elongated (d(metal-metal)=2.66 and 2.71 Å ($Mo_4Ru_2Se_8$); 2.63 and 2.67 Å ($Mo_{\sim 1.5}Re_{\sim 4.5}Se_8$)) than those in Mo_6Se_8(2.69 and 2.84 |). The apparent contraction exceeds that expected from atomic size considerations and confirms the correlation between the valence electron concentration on the metal atom cluster and the strength of the metal-metal bonds. The bond order sums calculated from the expression $n=(d(1)/d(n))^5$ lead to a more coherent description of the metal-metal bonding than those calculated from $d(n)=d(1)-0.6\log(n)$. (23 refs.)

118980 A new delafossite-type compound $CuYO_2$. I. Synthesis and characterization. T.Ishiguro, N.Ishizawa, N.Mizutani, M.Kato (Dept. of Inorganic Materials, Tokyo Inst. of Technol., Tokyo, Japan).
J. Solid State Chem. (USA), vol.49, no.2, p.232-6 (Sept. 1983).
Single crystals of a new delafossite-type compound $CuYO_2$ were grown from a Cu_2O-Y_2O_3 melt by slow cooling from 1210°C. The crystal is hexagonal, $P6_3/mmc$, a=3.5206(1) Å, c=11.418(1) Å, Z=2 and D_x=5.01 g/cm^3. Although the crystal belongs to the 2H-polytype of the delafossite family, selected peaks showed a large line broadening on the X-ray powder profile. Correspondingly, diffuse scattering along the c axis was observed for the reflections $h-k \neq 3n$ on the precession photographs. The approximate crystal structure was analyzed by means of single-crystal X-ray diffraction with a conventional R value of 0.106. (17 refs.)

118981 Synchrotron X-ray diffraction study of the room temperature incommensurate phase in graphite-bromine intercalation compound. D.Ghosh, D.D.L.Chung (Dept. of Metall. Engng. & Materials Sci., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Phys. Lett. (France), vol.44, no.18, p.L761-9 (15 Sept. 1983).
Synchrotron X-ray and a four-circle diffractometer were used to study the room temperature incommensurate phase in stage-2 graphite-bromine prepared with single crystal graphite in bromine liquid. The two strongest inplane superlattice reflections and the strongest satellite peak were scanned along the most incommensurate direction of the lattice between 302K and 324K. The incommensurate-commensurate transition at 319±1K caused disappearance of the incommensurate peaks and appearance of the commensurate one. Possible models of the incommensurate phase are presented. (17 refs.)

118982 Chemistry and characterization of group V transition metal trichalcogenides. A.Meerschaut (Lab. de Chimie des Solides, Nantes, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1615-22 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Through structural determinations, electron diffraction and diffuse X-ray scattering measurements, XPS results, a survey of group VA transition metal trichalcogenides is given. Few remarks are put forward from a chemical point of view. (i) The formation of cation pairs along the chain axis determines a semiconductor behaviour. The role of impurities or chemical defects is underlined through the CDW pinning mechanism. (ii) The commensurability effect is associated with the strength of the interchain coupling: for monoclinic TaS_3 this coupling is weaker than for $NbSe_3$ which is more covalent. (iii) Polytypism is present in many systems (NbS_3, TaS_3). Some compounds can only be obtained under high pressure. (21 refs.)

118983 A new family of compounds exhibiting the $FeNb_3Se_{10}$ structural type: structural and resistivity measurements. A.Meerschaut, A.Ben Salem, L.Guemas, J.Rouxel (Lab. de Chimie des Solides, Nantes, France), P.Monceau, H.Salva.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1681-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A new family of structure type $FeNb_3Se_{10}$ has been obtained V, Cr, Ta atoms substituting for Fe, Nb atoms in the $[(Fe,Nb)Se_6]$ octahedra chain. Preliminary magnetic susceptibility measurements are in agreement with those previously reported for $FeNb_3Se_{10}$. (8 refs.)

118984 New one-dimensional Vb transition metal tetrachalcogenides structural and transport properties. P.Gressier, A.Meerschaut, L.Guemas, J.Rouxel (Lab. de Chimie des Solides, Nantes, France), P.Monceau.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1741-3 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The series $(MX_4)_nY$ (M=Nb, Ta; X=S, Se; Y=I, Br, Cl; n=2,3,4) provides the authors with an example of a new environment of metallic atoms. From the study of the compounds $(NbSe_4)_3I$ and $(TaSe_4)_2I$, they emphasize the importance of cation pairing and of halogens number and position: $(TaSe_4)_2I$ undergoes a metal-insulator transition at T=265K, while $(NbSe_4)_3I$ is a high temperature semiconductor. (3 refs.)

118985 Modeling the spatial structures of silicas. Y.T.Thathachari, W.A.Tiller (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
Prog. Cryst. Growth & Charact. (GB), vol.6, no.4, p.415-23 (1983).
The authors studies are aimed at understanding the spatial features of materials of current interest, at the atomic level. Their specific interest at the start of their program was the formation of thin films of silica and silicon suboxides-characterization of the spatial structures, mechanisms of rearrangements and the energetics involved. The authors limit ourselves in this article to silica-Si O_2. They describe how some simple ideas lead to a better understanding of some prominent features of silica structures. In these studies, they are concerned with geometrical problems in some form or other, whether they describe the structures in terms of the positions of the centers of the constituent atoms or in terms of the distribution of the charge or probability densities. There is a hierarchy of structures. At the deepest level the authors limit themselves to atoms or ions and at the other end to thin films or crystals-single crystals or crystal grains. (36 refs.)

118986 Neutron-diffraction study of polycrystalline H_2SO_4 and H_2SeO_4. A.R.Moodenbaugh, J.E.Hartt, J.J.Hurst, R.W.Youngblood, D.E.Cox, B.C.Frazer (Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3501-5 (15 Sept. 1983).
Polycrystalline H_2SO_4 and H_2SeO_4 were studied by powder neutron-diffraction techniques at temperatures near the melting points and at 10K. This work was undertaken to determine hydrogen positions and to search for order-disorder transitions in the hydrogen-bond networks. Rietveld refinement located the hydrogen positions and established that the hydrogen atoms are ordered at the temperatures studied (i.e. no ordering transitions). The other atom positions were found to be consistent with those determined in earlier X-ray single-crystal analyses of the H_2SO_4 and H_2SeO_4 crystal structures. (10 refs.)

61.65 SPECIFIC STRUCTURE OF ORGANIC COMPOUNDS

118987 Geometric and electronic structural characterization of (3-cyano-4,5-dimethyl pyrrol-2-yl) oxamic acid ethyl ester using X-ray diffraction and ab initio quantum mechanics. D.J.Duchamp, E.C.Olson, B.V.Cheney (Res. Labs., Upjohn Co., Kalamazoo, MI, USA), J.A.Ryan, R.E.Christoffersen.
THEOCHEM (Netherlands), vol.13, no.1-2, p.179-89 (Sept. 1983).
The crystal and molecular structure of (3-cyano-4,5-dimethyl pyrrol-2-yl) oxamic acid ethyl ester has been determined by X-ray diffraction techniques. The clear monoclinic crystals, space group $P2_1/c$, were found to contain four molecules in a unit cell of dimensions $a=12.9216(4)$, $b=4.5234(2)$, $c=23.1188(8)$ Å and $\beta=119.585(2)°$. A trial structure was obtained by direct methods and refined by crystallographic least squares to a final R index of 0.084. The distances and angles in the pyrrole ring are indicative of considerable electron delocalization. Two bifurcated hydrogen bonds are found in the crystal structure, each consisting of one intramolecular and one intermolecular acceptor. Molecular orbital calculations have been performed on the molecule by means of the ab initio molecular fragment method. The calculations indicate that the isolated molecule adopts a planar conformation. The sites of high density in the higher-occupied and lower-unoccupied molecular orbitals suggest that the pyrrole moiety could effectively act either as a donor or an acceptor in a π-type charge-transfer complex. (15 refs.)

118988 Molecular conformation of di-*o*-anisylcarbinol: an X-ray diffraction study. C.Faerman, H.Negri, G.Punte (Dept. de Fisica, Nacional de La Plata, La Plata, Argentina), A.A.Vitale, N.S.Nudelman.
Can. J. Chem. (Canada), vol.61, no.9, p.2001-5 (Sept. 1983).
Di-*o*-anisylcarbinol crystallizes in the triclinic system, space group $P\bar{1}$ with $a=7.50(4)$, $b=10.89(4)$, $c=7.98(3)$ Å, $\alpha=101.9(1)$, $\beta=94.1(1)°$, $\gamma=94.6(1)°$, $Z=2$, $V=633.11$ Å^3, $D_c=1.28$ mg m^{-3} $D_m=1.26(1)$ mg m^{-3}, CuK$_\alpha$ radiation, $\lambda=1.54178$ Å, $\mu(\mathrm{CuK}_\alpha)=0.633$ mm^{-1}, $F(000)=260$. The structure has been determined by direct methods using single crystal X-ray data and refined by least-squares to the final R factors $R=5.89\%$ and $R_W=5.35\%$. The molecule has a twist-skewed conformation with the phenyl rings on nearly orthogonal planes. The crystal structure shows a hydrogen-bonded dimer and a peculiar arrangement of the methoxy and phenyl groups. (25 refs.)

118989 Structure of rhodocladonic acid. X-ray crystal structure analysis of its triacetate. S.McLean, P.Mahler, S.C.Nyburg, J.F.Sawyer, C.J.Webster, W.Wong-Ng (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.9, p.2055-8 (Sept. 1983).
The structure of the lichen pigment rhodocladonic acid, 2-acetyl-3,4,6-trihydroxy-7-methoxynaphthol[2,3,-*b*]furan-5,8-dione(1*a*), has been assigned on the basis of an X-ray crystal structure analysis of its triacetate (1*c*0). Crystals of the triacetate are triclinic, space group $P\$\bar{1}$ with cell dimensions $a=13.609(3)$ Å, $b=15.009(3)$ Å, $c=5.456(2)$ Å, $\alpha=106.66(4)°$, $\beta=103.45(3)°$, $\gamma=72.30(4)°$, $U=1004(1)$ Å^3, and $D_{\mathrm{calc}}=1.47$ g cm^{-3} for $Z=2$; $R_1=0.0505$ for 1644 observed ($F>6\sigma(F)$) reflections. (7 refs.)

118990 Structural analysis of 3-*C*-phosphonates, -phosphinates, and -phosphine oxides of branched-chain sugars. J.-R.Neeser, M.J.Tronchet, E.J.Charollais (Inst. de Chimie Pharmaceutique et Pavillon des Isotopes, Geneve Univ., Geneve, Switzerland).
Can. J. Chem. (Canada), vol.61, no.9, p.2112-20 (Sept. 1983).
A complete NMR study (^{1}H,^{13}C,^{31}P) of twelve 3-*C*-phosphonates, -phosphinates, and -phosphine oxide derivatives of 3-*C*-branched-chain pento- and hexo-furanoses is reported. For all compounds the configuration at C_3 is determined and, for oxaphospholanes **9** to **12**, the configuration at the asymmetric phosphorus atom. The $^3\mathbf{T}_2$ conformation of the furanose ring of acylic derivatives **1** to **8** and the conformationally rigid cis-fused oxaphospholane-furanose bicyclic systems of **9** to **12** have been used to study the $^3J_{\mathrm{PCCH}}$ vs. $\theta_{\mathrm{p.H}}$ and $^3J_{\mathrm{PCCC}}$ v. $\theta_{\mathrm{p.C}}$ relationships which are specific to this series of compounds. The use of the ν P=O IR stretching frequency, δ ^{31}P chemical shift, and $^1J_{\mathrm{P.C}}$ coupling constant values in structural analysis of *C*-phosphorus-bearing sugars is also reported and discussed. (32 refs.)

118991 Dynamical electron diffraction from elastically bent organic crystals. B.Moss, D.L.Dorset (Medical Foundation of Buffalo Inc., Buffalo, NY, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.609-15 (1 Sept. 1983).
Calculation of dynamical structure factors from a periodically curved crystal lattice have been carried out for the paraffin *n*-hexatriacontane, $C_{36}H_{74}$, and the linear polymer anhydrous nigeran, poly[(1→3)-α-D-maltose], $(C_{12}H_{20}O_{10})_n$. These are compared to dynamical structure factors from a flat crystal, and also to kinematic structure amplitudes from a bent lattice in order to determine the validity of considering each experimentally observed data perturbation separately. Individual treatment of these effects is found to be a good approximation so long as the crystal thickness and bend deformations are both small. (24 refs.)

118992 Studies on rare-earth carboxylates. II. Crystal chemical data on $\mathbf{Ln(CH_3CHCH_3COCO)_3}$, where Ln=Er, Tm or Yb. M.A.Nabar, S.D.Barve (Dept. of Chem., Univ. of Bombay, Bombay, India).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.576 (1 Oct. 1983).
For pt.I see Proc. 7th ICTA, Ontario, vol.1, p.464 (1982). Summary form only given, as follows. The rare-earth isobutyrates, $Ln(CH_3CHCH_3COO)_3$ (where Ln=Er, Tm or Yb), have been synthesized and studied crystallographically. The salts are orthorhombic with space-group *Pmma* containing four molecules per unit cell. The lattice parameters are: for $Er(CH_3CHCH_3COO)_3$, $a=11.35(1)$, $b=9.806(6)$, $c=15.40(2)$ Å, $V=1714$ Å^3, $D_m=1.67$, $D_x=1.66$ Mg m^{-3}, for $Tm(CH_3CHCH_3COO)_3$, $a=11.32(1)$, $b=9.781(9)$, $c=15.39(2)$ Å, $V=1703$ Å^3, $D_m=1.68$, $D_x=1.68$ Mg m^{-3}; for $Yb(CH_3CHCH_3COO)_3$, $a=11.23(2)$, $b=9.665(22)$, $c=15.34(5)$ Å, $V=1665$ Å^3, $D_m=1.68$, $D_x=1.73$ Mg m^{-3}. The JCPDS Diffraction File No. for $Tm(CH_3CHCH_3CO_2)_3$ is 34-1997. (no refs.)

118993 $\mathbf{(TMTSF)_2ClO_4}$: mean structure at 7K. Comparative study with 300K and 125K data. B.Gallois, D.Chasseau, J.Gaultier, G.Hauw (Lab. de Cristallographie, Univ. de Bordeaux I, Talence, France), A.Filhol, K.Bechgaard.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1071-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The formation of a superstructure, characterized by a (0,1/2,0) wave vector, reveals the occurrence of a phase transition at 24K which may involve the ordering of the ClO_4^- anions, in the quasi 1D conductor: $(TMTSF)_2ClO_4$. Neutron diffraction experiments were performed at 7K, in order to determine the exact low temperature structure of this compound. Preliminary results allow only to obtain a 'mean structure'. Nevertheless, from a comparative study of 295K, 125K and 7K structural data, two parameters seem relevant at very low temperature: a larger dimerization and a more pronounced interchain coupling. The temperature dependence of the lattice parameters shows a first transition at 150K which is not understood yet. (11 refs.)

118994 Influence of the disorder potential of the anions on the ground state of the organic alloy $\mathbf{(TMTSF)_2(ClO_4)_{1-x}(ReO_4)_x}$. S.Tomic, D.Jerome, D.Mailly, M.Ribault, K.Bechgaard (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1075-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present experimental investigation of the organic alloy $(TMTSF)_2$ $(ClO_4)_{1-x}(ReO_4)_x$. The results show an important influence of nonmagnetic impurities on a low temperature behaviour. (5 refs.)

118995 Radical cation salts of arenes, synthesis, structures and properties. V.Enkelmann (Inst. fur Makromolekulare Chem., Freiburg, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1147-52 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Radical cation salts of arenes are obtained by anodic oxidation. They are a new family of organic conductors composed of simple and easily obtainable building blocks. The electrochemical processes leading to crystal formation, crystal structures, phase transitions and the model character for conducting polymers are discussed. (11 refs.)

118996 A new series of radical cation salts: the trimethylenetetrathiafulvalenium pseudo halides salts ($\mathbf{tTTF_2\text{-}X'}$). D.Chasseau, J.Gaultier, J.L.Miane, C.Coulon, P.Delhaes, S.Flandrois (Univ. de Bordeaux I, Talence, France), J.M.Fabre, L.Giral.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1223-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The X-ray crystal structures at 295K and several physical properties (electrical conductivity, paramagnetic susceptibility, EPR g-factor and linewidth) have been investigated on two typical salts ($X^-=BF_4^-$ and AsF_6^-) of a new series of one electronic chain compounds ($tTTF_2$-X′) based on the asymmetrical molecule-trimethylene 4-5 tetrathia 1.1′ 3.3′ fulvalene (tTTF). The results show two different behaviours which point out the fundamental role played by the symmetry of the counter-ion on the stacking organization of tTTF molecules. (7 refs.)

118997 Radical-cation salts of substituted perylenes. R.Lapouyade, J.P.Morand, D.Chasseau, C.Hauw, P.Delhaes (Univ. de Bordeaux I, Talence, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1235-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A radical cation salt of 1,2,7,8-tetrahydrocyclopenta [cd:lm]perylene ($\underline{1}$) has been synthetized with the given stoichiometry $[\underline{1}]_2^{\cdot+}PF_6^-CH_2Cl_2$. Structural and physical properties (electrical conductivity, EPR) show that this new compound presents specific features. (5 refs.)

118998 Electrocrystallisation and physical properties of dimethyltetrathia-fulvalenium salts. A.Abderraba, R.Laversanne, E.Dupart, C.Coulon, P.Delhaes, C.Hauw (Univ. de Bordeaux I, Talence, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1243-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The series of radical cation salts based on the unsymmetrical dimethyl-4,5 tetrathiafulvalene molecule has been investigated: $DMTTF_2$-X′. From the observed structural and physical properties it appears that this series offers some analogy with the nonstoichiometric TTF salts. (4 refs.)

119000 Analysis of $\mathbf{2k_F}$ X-ray diffuse scattering intensity in HMTSF-TCNQ. K.Yamaji (Electrotech. Lab., Ibaraki, Japan), J.P.Pouget, R.Comes, K.Bechgaard.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1321-3 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The observed $2k_F$ X-ray diffuse scattering from HMTSF-TCNQ has been reproduced by using a model of rigid-molecular translations of HMTSF molecules with components along the a- and c-axes. The HMTSF molecule is found to translate nearly in parallel with its longest dimension in the $2k_F$ lattice modulation. (4 refs.)

119000 Diffuse X-ray scattering and order-disorder effects in the iodide chain compound 4-(2,6-diphenyl, 4-H-thiopyran-4-ylidene)-2,6-diphenyl iodide, $\mathbf{DIPS\Phi_4(I_3)_{0.76}}$. P.A.Albouy, J.P.Pouget (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France), H.Strzelecka.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1339-43 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The structure of polyiodide chains in the compound $DIP\Phi_4(I_3)_{0.76}$ has been studied by X-ray scattering as a function of temperature. (11 refs.)

119001 The polaron paracrystal and the relation between diffuse and discrete satellites in 1-D bis (oxalato) platinates. A.Bertinotti, D.Luzet (Service de Phys. du Solide et de Resonance Magnetique, CENS, Gif-sur-Yvette, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1551-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The X-ray diffraction satellite spectra of various 1-D bis (oxalato) platinates, where diffuse satellite planes coexist with discrete satellite spots at the same temperature, are interpreted with a structural model based on the Wigner crystal concept. The chains are fragmented into micro-domains by periodic intrinsic defects associated with polarons. Three orthogonal deformation modes, one longitudinal and two transverse, are present in each chain; a fourth mode corresponds to a global sliding of the molecular columns. Based

on this model a significant agreement between observed and calculated satellite intensities is obtained. (11 refs.)

119002 Electrical and structural characterisation of $\mathrm{(DBzBP)(TCNQ)_4}$. G.J.Ashwell, K.Osborne (Dept. of Chem., Sheffield City Polytech., Sheffield, England).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K35-9 (Sept. 1983).
The authors report the crystal structure and conductivity of $\mathrm{(DBzBP)(TCNQ)_4}$ and also the electrical properties of the simple salt $\mathrm{(DBzBP)(TCNQ)_2}$. The structure has been investigated in order to determine the degree of back charge transfer, if any, and the degree of electron localisation on the crystallographically independent TCNQ sites. (12 refs.)

119003 Hydrogen bond formation and anion ordering in superconducting $\mathrm{(TMTSF)_2ClO_4}$ and $\mathrm{(TMTSF)_2AsF_6}$. M.A.Beno, G.S.Blackman, P.C.W.Leung, J.M.Williams (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
Solid State Commun. (USA), vol.48, no.2, p.99-103 (Oct. 1983).
An examination of the low temperature (125K) X-ray diffraction determined structure of $\mathrm{(TMTSF)_2ClO_4}$, the only ambient pressure organic superconductor known, reveals a previously unseen nearest-neighbor hydrogen bonding environment surrounding the anion resulting in short oxygen atom to methyl-hydrogen atom interactions that are likely responsible for the ordering of the $\mathrm{ClO_4^-}$ anion associated with a transition observed at 24K. Superconductivity is observed in $\mathrm{(TMTSF)_2ClO_4}$ only when the anions adopt an ordered (relaxed) configuration. In contrast to the previously reported single short Se...O distance, the O...H-C contacts are both short and numerous. The observed librational motion of the perchlorate anion provides further support for the importance of the O...H interactions in the pinning of the anion. Additional discussion regarding the influence of F...H hydrogen bonds on the $\mathrm{AsF_6^-}$ anion disorder in $\mathrm{(TMTSF)_2AsF_6}$, a superconductor under applied pressure only, is also presented. (13 refs.)

61.70 DEFECTS IN CRYSTALS

(see also 61.80 Radiation damage, 62. Mechanical and acoustic properties, 71.55 Impurity and defect levels, 76.30M EPR of colour centres and other defects, 78.50 Impurity and defect absorption in solids, 81.40 Treatment of materials)

119004 Defect structure of anion-excess fluorite-related $\mathrm{Ca_{1-x}Y_xF_{2+x}}$ solid solutions. J.P.Laval, B.Frit (Lab. de Chimie Minerale Structurale, UER des Sci., Limoges, France).
J. Solid State Chem. (USA), vol.49, no.2, p.237-46 (Sept. 1983).
On the basis of the transformation of a cube within a fluorite-type matrix into an archimedean antiprism of the kind found in numerous ordered anion-excess fluorite-related superstructures, a new polyhedral cluster, labeled 4:4:3 is proposed to explain the defect structure and short-range order in $\mathrm{Ca_{1-x}Y_xF_{2+x}}$ solid solution. In agreement with the spectroscopic, dielectric, and electric experiments, this new structural model fits perfectly well the measured occupation numbers for normal F and interstitial F′ and F″ fluorine atoms for the whole range of compositions without requiring the too short F′-F′ distances generated by the previously proposed 2:2:2 or 3:4:2 clusters. Such 4:4:3 clusters and nearly identical 4:4:4 or 4:4:5 ones, are probably present in the other highly and moderately doped $\mathrm{Ca_{1-x}}Ln_x\mathrm{F_{2+x}}$ solid solutions; they could be precursors for the largest clusters, i.e. ordered microdomains, observed for samples annealed for a long time. (46 refs.)

119005 X-ray topographic studies of $\mathrm{TEA(TCNQ)_2}$ crystals. A.Lindegaard-Anderson (Lab. of Appl. Phys., Tech. Univ. of Denmark, Lyngby, Denmark), M.Almeida, L.Alcacer, K.Mortensen.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1325-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The quality of single crystals of $\mathrm{TEA(TCNQ)_2}$, grown by controlled cooling of acetonitrile solutions, has been studied by X-ray topography. Thin plates ($\sim 0.15 \times 3 \times 15\ \mathrm{mm^3}$) carefully grown by spontaneous nucleation are highly perfect. Only a few microchannels and straight dislocations are observed. Larger crystals grown from seeds are less perfect. Typical defects are inclusions, dislocations, growth sector boundaries and growth bands. The results are correlated to growth mechanisms and can be used to optimize growth conditions. (4 refs.)

119006 Chemical nature of irradiation defects in some TCNQ salts. N.Mermilliod (Section d'Etude des Solides Irradies, CEN, Fontenay-aux-Roses, France), N.Sellier.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1353-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Correlates the resistance to irradiation of some organic conductors with their molecular structure; the authors have also investigated the chemical nature of some irradiation defects: broken bonds and formation of cross linking. (5 refs.)

119007 Indirect interaction in semiconductors. V.-C.Lee, L.Liu (Dept. of Phys. & Astron., Northwestern Univ., Evanston, IL, USA).
Solid State Commun. (USA), vol.48, no.4, p.341-4 (Oct. 1983).
The authors consider the electron mediated indirect interaction between localized neutral defects in semiconductors with s- and p-band edges located at the center of the Brillouin Zone. Based on wavefunction symmetry, they conclude that electrons occupying different valence bands mediate interactions of different signs. Quantitative calculations based on the isotropic k.p band structure for a series of III-V and II-VI semiconductors show that while the net interaction is attractive between nearest neighbor defects, it becomes repulsive for defects separated by one or more lattice constants. (3 refs.)

119008 Scattering of elastic waves from simple defects in solids, a review. B.R.Tittmann (Materials Characterization, Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
Wave Motion (Netherlands), vol.5, no.4, p.299-306 (Aug. 1983).
The emphasis is on the representation in the time-domain as contrasted to that in the frequency-domain, although both aspects are discussed. The defects are principally small voids ranging in shape from spherical voids to simulated flat cracks with combinations of these, such as a double void and a void surrounded by a flat crack. The defects were produced in Ti-alloy by the diffusion bonding process and were typically about 1 mm in extent. The scattered radiation pattern was probed in the $1<ka<4$ range using conventional transducers and electronics. Upon capture, the scattered waveforms were digitized and processed. Careful evaluation of the time-domain results, even before extensive signal processing, form an invaluable guide to the characterization of a simple flaw, which is the object of advanced techniques in NDE. 61.70B Interstitials and vacancies

(exc. colour centres)

119009 Lattice defects in (Hg,Cd)Te: investigations of their nature and evolution. H.F.Schaake, J.H.Tregilgas, A.J.Lewis, P.M.Everett (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1625-30 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Brief summaries of the precipitation of tellurium in (Hg,Cd)Te during the quench from the recrystallization anneal of the solid state recrystallization process and the subsequent dissolution of these precipitates during the postanneal are given. It is shown that if vacancies and interstitials are considered to be the only important point defects in the lattice, the observed mechanisms of precipitation and annihilation require that tellurium in excess of stoichiometry must be accommodated by metal vacancies. Diffusion from the mercury ambient during postanneal then must occur by metal interstitials. Enhanced self-diffusion on the metal sublattice is shown to occur along grain and subgrain boundaries. The most significant source of dark current in CID imagers fabricated on (Hg,Cd)Te is shown to be a sufficiently high dislocation density in a pixel. (32 refs.)

119010 On a point defect inside an idealized elastic sphere. Chih-Bing Ling (Dept. of Math., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), C.R.Houska.
J. Appl. Phys. (USA), vol.54, no.9, p.5123-7 (Sept. 1983).
Presents a method of solution for the displacement, stress, and strain due to a point defect located inside a sphere. The solution is represented by a Love stress function in spherical coordinates, which is biharmonic in character. Two axisymmetric types of the point defect are considered. One is treated as a center of dilatation and the other as a double force without moment, or a doublet, oriented axisymmetrically. The Love stress function for the point defect in an infinite solid is specified in each case by a single biharmonic function. The residual tractions on the surface of the sphere left by this function are annulled by superposing two series of biharmonic functions. When the Love stress function is determined, the displacement, stress, and strain can be derived straightforwardly. (8 refs.)

119011 Vacancy ordering in $\mathrm{Sc_{1-x}S}$. H.F.Franzen, R.T.Tuenge, L.Eyring (Chem. Dept., Arizona State Univ., Tempe, AZ, USA).
J. Solid State Chem. (USA), vol.49, no.2, p.206-14 (Sept. 1983).
Presents a study of scandium vacancy ordering in slowly cooled $\mathrm{Sc_{1-x}S}$ using high-resolution electron microscopy. Previous X-rays analysis had shown segregation into alternate (111) planes of the rocksalt substructure. The present study reveals a further incommensurate ordering of the vancancies within the $(111)_c$ planes in approximately every third $(110)_{\mathrm{rhombohedral}}$ plane. The incommensurate order was easily destroyed by the irradiation and heating of the electron beam. These observations are discussed in terms of the termination of the wave vector within the Brillouin zone and described in terms of a possible continuous transition to an incommensurate Sc atom population wave. (8 refs.)

119012 Ionic and electronic processes during Frenkel defect annealing in KBr crystals above LHeT. V.Ziraps (Inst. of Solid State Phys., Latvian State Univ., Riga, Latvian SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.49-59 (1 Sept. 1983).
The relaxation of radiation-induced optical absorption spectra and a set of thermally stimulated curves (current, depolarization current, diffusion current,

emission-desorption of gas, thermal bleaching) of KBr crystals X-irradiated at 4.6K are recorded synchronously or step by step. A multistage annealing of defects is detected: (i) from 4.6 to 32K about ten substages controlled by the I centre delocalization are accompanied by electron and energy release, (ii) from 32 to 60K about six substages controlled by the H centre delocalization are accompanied by corresponding electron and energy release and gas desorption peaks. A recombination of the migrating I or H centres within such complementary defect systems (pairs, triplets et al.) takes place: (i) $\{I...\alpha\}$, $\{I...F...V_k\}$, $\{I...F'...V_k...V_k\}$, (ii) $\{H...F\}$ and $\{H...F'...V_k\}$. Following phenomena in KBr at 4.6K are observed and discussed: (i) the 'F-photostimulated' electron tunneling transfer within the excited pair $\{F^*...H_A\}\rightarrow\{\alpha...I_A\}$, (ii) the effect of DC field (3 kV/cm) caused Frenkel defect formation efficiency increase (by$\geq$10%), (iii) the photoelectrical dissociation of the α centres. Comments about the anion Frenkel primary defect generation mechanisms are made. (27 refs.)

119013 Atomic configurations of interstitials in intermetallic compound Nb_3Sn. N.V.Moseev, V.G.Chudinov, B.N.Goshchitskii, V.I.Protasov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.67-70 (Sept. 1983).
Interstitials in Nb_3Sn are investigated by a molecular dynamics technique. It is shown that around the interstitials the atomic displacements are appreciably larger than around the vacancies and antisite replacements. It is concluded that this phenomenon must lead to amorphization of Nb_3Sn under irradiation with light charged particles at low temperatures. (5 refs.)

119014 Atom-vacancy states in crystals. V.E.Panin, V.E.Egorushkin, Yu.A.Khon, T.F.Elsukova (Inst. of Atmospheric Optics, Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.12, p.1073-93 (Dec. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.12, p.5-28 (Dec. 1982). [received: Oct. 1983]
The authors substantiate the assumption that a new type of local excitation states, in dynamic equilibrium with their crystal environment, arise in crystals in an external field. These regions behave much like a supercooled liquid but are neither liquid-crystal or microcrystalline (crystallites growing in an amorphous phase) states. Their existence is possible only within a crystal with which they coexist as a two-phase system. The formation of such states plays a fundamental role in the behavior of crystals. (58 refs.)

119016 P_{Ga} antisite defect in Zn-implanted $GaAs_{0.1}P_{0.9}$ LED. R.Pickenhain, B.Rheinländer, S.Brehme (Wissenschaftsbereich Halbleiterphys., Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K61-3 (Sept. 1983).
The authors report on injection luminescence (EL), DLTS, and optic CLTS (ODLTS) studies on yellow emitting, Zn-implanted VPE-$GaAs_{0.1}P_{0.9}$:N LED. The net donor doping level in the non-doped n-region is determined by C-V analysis to be N_D-$N_A\approx2\times10^{16}$ cm^{-3}. The diodes were stressed during 1000 h using a current density $j_s=40$ A cm^{-2}. After stressing a small increase of the net donor doping level is observed. The DLTS measurement exhibited the emergence of a deep level having a density of about 10^{13} cm^{-3} and a thermal activation energy E_c-$E_T=930$ meV below the conduction band. (5 refs.)

119018 Effects of nitrogen on dislocation behavior and mechanical strength in silicon crystals. K.Sumino, I.Yonenaga, M.Imai (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan), T.Abe.
J. Appl. Phys. (USA), vol.54, no.9, p.5016-20 (Sept. 1983).
The characteristics of dislocation behavior and mechanical strength in tensile tests are investigated on the silicon crystals that are doped with nitrogen at the time of crystal growth by the floating-zone technique. These are compared with those in the usual floating-zone-grown silicon crystals. Nitrogen atoms dispersed in a silicon crystal are shown to have no influence on the velocities of dislocations in motion in the temperature range above 600°C. Dislocations in the nitrogen-doped crystal are, however, immobilized while the crystal is kept under a low or zero applied stress at elevated temperatures. Like Czochralski-grown silicon, nitrogen-doped silicon shows a much higher yield strength than usual floating-zone-grown silicon when crystals are dislocated. It is concluded that interstitial nitrogen atoms bring about the hardening of silicon crystals through locking of dislocations upon congregating on the latter. (14 refs.)

119019 The effect of annealing on the defect structure and electrical properties of deformed single crystals of Ge. V.V.Aristov, Yu.A.Osipyan, R.Scholz, I.I.Snighireva, I.I.Khodos, S.A.Shevchenko (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.47-55 (Sept. 1983).
The dissociation of dislocations in deformed and annealed specimens of p-type germanium is studied using the weak-beam method of electron microscopy. Both the Hall EMF and DC conductivity are measured within the temperature range 4.2 to 300K. It is shown that the splitting values of dislocations with a predominant screw component depend on the cooling rate and subsequent annealing of the deformed specimens. The effect of annealing on the concentration and the mobility of current carriers is also found. It is concluded that the splitting parameters of dislocations in the specimens under study are connected with the behavior and state of point defects. (24 refs.)

119020 On the role of surface oxides in the processes of metal etching. G.K.Baranova (Solid State Phys. Inst., Acad. of Sci., Chernogolovka, USSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K9-12 (Sept. 1983).
Etching techniques for revealing dislocations and determining crystallographic orientation by etch figure shapes have been widely used to study the structure of metals. Principal regularities of the processes of orientation and dislocation etching of metals suited for oxidation are considered and comparison characteristics of orientation figures and dislocation etch pits are adduced. (10 refs.)

119021 Dislocation mobility in hydrostatically compressed KBr crystals. V.I.Barbashov, Yu.B.Tkachenko (Phys. Tech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K17-19 (Sept. 1983).
The object of the present study is to investigate weakly doped KBr crystals with yield point of about (2.2±0.1)MPa. This choice is due to the fact that KBr crystals are close to KCl concerning some physical characteristics (energy of ion bond, polarizability, energy of stacking fault, behaviour of elastic constant C_{44} with pressure). (7 refs.)

119022 Transport of electric charge by complete and partial dislocations in ZnS. A.V.Zaretskii, L.G.Kirichenko, V.F.Petrenko, G.K.Strukova, I.I.Khodos (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.408-12 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.715-21 (March 1983). [received: Oct. 1983]
Plastic deformation of microtwin ZnS crystals was found to involve simultaneous motion of complete and partial dislocations. It was possible to select the deformation conditions so that one or the other type of dislocation predominated: in such situations the dependences of the electric charge of moving dislocations on the temperature and rate of deformation were similar to those observed earlier for other II-VI compounds. 119023 The photodamping of dislocations in KCl single crystals. M.A.Golosovskii, Ya.M.Soifer (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.991-7 (1983).
The effect of *F*-light ($\lambda=550$ nm) on the dislocation amplitude-dependent internal friction (dislocation photodamping) and dislocation charge in KCl crystals of different purity containing *F*-centers has been investigated. The photodamping process in all the crystals under study has been found to be due to the optical generation of new pinning points. The conditions of photopinner formation are found to depend on the magnitude of dislocation charge, the manner of the *F*-center introduction (γ-irradiation, additive coloration), and crystal purity. A model of photopinner formation has been proposed. The results obtained are used to analyse the binary systems in which the effect of dislocation photodamping is likely to occur. (14 refs.)

61.70N Grain and twin boundaries

119024 EBIC characterization of electrically active defects in (Hg,Cd)Te. T.M.Moore, H.F.Schaake (Materials Sci. Lab., Texas Instruments Inc., Dallas, TX, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1666-8 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
A comparison of low temperature electron beam induced current imaging in the scanning electron microscope and surface defect etch studies has identified subgrain boundaries and isolated dislocations as electrically active recombination centers in *p*-type solid state recrystallized $(Hg_{1-x}Cd_x)Te$ with $X=0.3$. The 'spotty' appearance of these images is attributed to enhanced recombination at Te-rich precipitates decorating dislocations in the subgrain boundaries. (12 refs.)

119025 AES/STEM grain boundary analysis of stabilized zirconia ceramics. A.J.A.Winnubst (Twente Univ. of Technol., Dept. of Chem. Engng., Enschede, Netherlands), P.J.M.Kroot, A.J.Burggraaf.
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.955-60 (1983).
Semiquantitative Auger electron spectroscopy (AES) on pure monophasic $(ZrO_2)_{0.83}(YO_{1.5})_{0.17}$ was used to determine the chemical composition of the grain boundaries. Grain boundary enrichment with Y was observed with an enrichment factor of about 1.5. The difference in activation energy of the ionic conductivity of the grain boundary compared with the bulk can be explained by the Y segregation. When Bi_2O_3 is introduced into this material and second phase appears along the grain boundaries of the cubic main phase. Energy dispersive X-ray analysis (EDS) on a scanning transmission electron microscope (STEM) shows an enrichment of bismuth at the grain boundaries of this second phase. (20 refs.)

119026 Grain boundaries structure in hexagonal crystal. P.Delavignette (CEN/SCK, Mol, Belgium).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.111-24 (1983). In French. (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
A method is given for the analysis of coincidence grain boundaries in transmision electron microscopy. A formal expression is given for coincidence lattices, with a special application to the hexagonal system. A high precision method is given for the determination of all the characteristics of subgrain boundaries. A particular application of the method to the analysis of deformation twinning in hexagonal structures allowed a new approach of the different twinning modes in these structures. (11 refs.)

119027 Grain boundaries structure observed by high resolution electron microscopy. J.M.Penisson (CEA, Grenoble, France), C.D'Antertoches, J.Desseaux-Thibault, A.Bourret, A.Renault.
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.125-34 (1983). In French. (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
High resolution electron microscopy is used to study the atomic structure of some tilt grain boundaries in metals and semiconductors. The method itself is described and its limitations are shown. The main experimental results on $\Sigma=3$. $\Sigma=9$, $\Sigma=41$ in Si and Ge, and $\Sigma=41$ in molybdenum bicrystal are reviewed. (22 refs.)

119028 Electron diffraction study of symmetrical tilt boundaries in germanium. A.-M.Papon, M.Petit, G.Silvestre, J.-J.Bacmann (CENG., Grenoble, France).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.135-46 (1983). In French. (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
The reciprocal lattice of the grain boundary zone of symmetrical tilt grain boundaries in germanium is investigated using electron diffraction technique. The diffraction from short grain boundaries arising from the decomposition of a $\Sigma=27$, and a detailed analysis of the diffraction patterns from the $\Sigma=9,11$ and 5 boundaries are presented. It is shown that grain boundary reflexions really exist and that, in correct conditions, its reciprocal lattice can be determined. The results from diffraction are also discussed in relation with those from other techniques in order to approach the grain boundary space group. (23 refs.)

119029 The study of grain boundary structure and properties in engineering materials. B.Ralph, A.Porter (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.159-75 (1983). (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
The importance of grain and phase boundaries in determining the physical and mechanical properties of crystalline materials is well established. However, a complete discription of the role of grain boundaries in influencing local microstructure is not simply achieved. Accurate data as to structural, crystallographic and chemical parameters are all required if a complete picture is to be formed. This review examines the various models of grain boundary structure available, and describes a number of recent experimental studies of boundary-sensitive properties in engineering materials. (67 refs.)

119030 Intergranular segregation and precipitation. L.Priester (Lab. de Metall. Phys., Univ. Paris-Sud, Orsay, France).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.211-32 (1983). In French. (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
An attempt is made to present the current knowledge about intergranular segregation and precipitation in relation with equilibrium and non-equilibrium grain boundary structure. Recently, numerous theoretical studies on metals and oxides, have emphasized the link between segregation and structure on the basis of the polyhedral units model. Few works on the interaction between extrinsic dislocations and solutes are available, only on metals and from an experimental viewpoint; nevertheless, the important role of these defects as nucleation sites of a new intergranular phase has been recently underlined. The intergranular precipitation not only depends on inherent parameters of the grain boundary (structure and defects) but obviously on crystallographic relations between the grain boundary and the neighbouring crystals with regard to the orientation relationship between precipitate and matrix. In both cases, intergranular segregation and precipitation, an important problem to be solved is the occurrence of a hierarchy of structural influences. (65 refs.)

119031 Characterisation of grain boundaries in silicon by TEM and EBIC. C.Dianteill, A.Rocher (Lab. d'Optique Electronique, CNRS, Toulouse, France).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.233-42 (1983). In French. (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
EBIC and TEM observations have been performed to establish a correlation between crystalline structure and electrical activity of grain boundaries in silicon. A correlation between the coherence of the grain boundary and the low electrical activity has been shown for the (221) $\Sigma 9$. Nevertheless some coherent grain boundaries can be electrically activated by heat treatment. (15 refs.)

119032 Mechanical twinning of $(TMTSF)_2ClO_4$ single crystal. T.Ishiguro, T.Ukachi, M.Tokumoto, K.Murata, K.Kajimura, H.Anzai (Electrotech. Lab., Ibaraki, Japan), K.Kato, G.Saito.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1063-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Mechanical kinks are formed in a needle crystal of $(TMTSF)_2ClO_4$ by applying stresses perpendicular to the needle axis. By X-ray precession photography, the authors have found that the kink is ascribed to the mechanical twinning with the boundary on the (210) plane. (6 refs.)

119033 Anomalous temperature dependence of the drag coefficient of a twinning dislocation. V.S.Boiko, V.F.Kivshik (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.412-14 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.722-6 (March 1983). [received: Oct. 1983]
High-speed cinematography was used to study the dynamics of growth of a twin under a concentrated load and its emergence from a calcite crystal under the action of surface tension forces at temperatures 243-723K. The dislocation theory of the dynamic behavior of a twin was found to provide a satisfactory description of its behavior at high and low velocities. An analysis of the experimental data using relationships from this theory yielded the temperature dependence of the drag coefficient *B* of a twinning dislocation. The dependence was anomalous: instead of a rise of *B* on increase in temperature,

typical of the drag due to the interaction between a dislocation and elementary excitations of the lattice, there was an exponential fall. Such a temperature dependence $B(T)$ indicated that, in the investigated range of temperatures and velocities, the mechanism of the drag experienced by twinning dislocations involved relaxation processes in the medium stimulated by the motion of dislocations. The relaxation drag of twinning dislocations was assumed to represent the recovery of an orientational order disturbed locally near a moving twinning dislocation. The activation energy of the process, 0.086 eV, indicated that in calcite the relaxation process could be reorientation of CO_3 groups in the field of a moving dislocation. The proposed mechanism of the drag experienced by twinning dislocations could apply to orientationally ordered structures. (16 refs.)

119034 A new crystallographic shear structure in tin oxide. C.Kaito, T.Harada, T.Miyano (Dept. of Phys., Kyoto Tech. Univ., Kyoto, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L394-6 (July 1983).
Tin oxide crystals grown by electron beam irradiation of vacuum deposited amorphous films were investigated by a high resolution transmission electron microscopy (HRTEM) with the aid of computer simulation. A new type of ordered (110) CS structure with 1/2[110] shear and 1/2[110] glide were found in the reduced $Sn_{m+1}O_m$ crystals with $m=4$. (11 refs.)

119035 X-ray topographic observation of stacking fault in KCl. H.Hattori (Phys. Lab., Fukui Univ., Fukui, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3066-72 (Sept. 1983).
Two dimensional lattice defects in KCl crystal were observed by means of optical and X-ray topographic methods. The defects produced three types of diffraction images on X-ray topographs, that are the symmetric and asymmetric ones for $\pm\mathbf{g}$ of reciprocal lattice vectors, and the diffuse images for any $\mathbf{g}$. From the appear-disappear relation for various $\mathbf{g}$ and geometrical considerations, it was concluded that the defects are stacking faults, and the fault vector is nearly $a/6\langle 211\rangle$ which is anti-parallel to the Burgers vector of Shockley partial dislocation in an FCC structure. The stacking fault is accompanied by an expansion distortion perpendicular to the $\{111\}$ fault plane. The defects giving asymmetric or diffuse images are concluded to be formed by the superposition of simple stacking faults.

119036 Crystal site location of dopants in semiconductors using a 100-keV electron probe. J.Tafto, J.C.H.Spence (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA), P.Fejes.
J. Appl. Phys. (USA), vol.54, no.9, p.5014-15 (Sept. 1983).
The channeling effect on electron induced characteristic X-ray emission has been used to study the site occupancy of As in submicron regions of Si(3×10^{19} As atoms cm^{-3}). The authors report here the first absolute intensity measurements of the crystallographic orientation dependence of characteristic X-ray production by kilovolt electrons in order to determine quantitatively the crystal site occupancy of an impurity. (9 refs.)

119037 On the location of an absorbed hydrogen atom in aluminum metal. H.F.Ades, A.L.Companion (Dept. of Chem., Univ. of Kentucky, Lexington, KY, USA).
Solid State Commun. (USA), vol.48, no.4, p.337-40 (Oct. 1983).
Extended Huckel molecular orbital calculations indicate that a hydrogen atom absorbed in aluminum metal is bound in an off-center tetrahedral interstitial site adjacent to a vacancy, thus confirming previous jellium-based theoretical predictions and results of nuclear channelling experiments. The authors' work further indicates that these are the only stable internal sites for hydrogen atoms in an aluminum lattice. (21 refs.)

119038 GaAs P-layer formation by Be ion implantation. S.Sugata, N.Tsukada, M.Nakajima, K.Kuramoto, Y.Mita (Optoelectronics Joint Res. Lab., Kawasaki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L470-2 (July 1983).
A novel, nearly hazardless Be ion implantation technique has been realized by adopting BeO ceramic material as an ion source. This method made possible a continuous Be ion current of several tens of μA without noticeable contamination. High dose Be ion implantation experiments were carried out using this technique and it has been found that Be atom activation can be improved by hot implantation and subsequent lower temperature annealing. (9 refs.)

119039 Two different species of deuterium implanted into a pyrolytic graphite observed by XPS-SIMS. K.Ashida (Radio-isotope Lab., Toyama Univ., Toyama, Japan), K.Ichimura, K.Watanabe.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1465-8 (1983).
Trapped states of deuterium implanted into a pyrolytic graphite with 5 keV were investigated by means of the X-ray photoelectron spectroscopy and the secondary ion mass spectrometry. Chemical shift and broadening of C 1*s* peak were observed in the ZPS spectra due to deuterium-ion implantation at room temperature. The shift and the broadening increased with the deuterium fluence to reach constant values. In the SIMS spectra, CD^- and C_2D^- peaks appeared due to the deuterium implantation. The intensity of the CD^- peak increased with the fluence to reach a constant value, whereas that of the C_2D^- peak passed through a maximum to decrease to a constant value. A linear relation was observed between the chemical shift and the CD^- peak. The chemical shift and the CD^- peak disappeared after annealing the sample at 600°C for 5 min, whereas the broadening of the C 1*s* peak and the C_2D^- peak disappeared after annealing the sample at 900°C for 5 min. On the basis of these observations, it is concluded that at least two different species of the deuterium are formed in the graphite due to the deuterium implantation. (21 refs.)

119040 Annealing of $Hg_{1-x}Cd_xTe$: Hg loss rates and annealing of ion implantation damage. K.C.Dimiduk, W.G.Opyd, J.F.Gibbons, T.W.Sigmon (Stanford Electronics Labs., Stanford, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1661-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
An important problem in processing the infrared detector material $Hg_{1-x}Cd_xTe$ is avoiding undue mercury loss. Here the authors quantify that loss and apply the information to the annealing of ion implanted $Hg_{1-x}Cd_xTe$. They thus extend the work of Takita et al. on Hg loss in HgTe to the ternary $Hg_{1-x}Cd_xTe$. The Hg loss is generated with a thermal-pulse annealing system and measured by Rutherford backscattering spectrometry (RBS). The loss rate is studied as a function of temperature, composition, and surface preparation (chemimechanical and contactless polishing). For each set of conditions the data is fit to an Arrhenius equation $N_{\square}/t=A\exp(-\Delta E/kT)$ and the fitting parameters A and ΔE are determined. ΔE ranges from 1.0 to 2.5 eV and A varies from 10^{23} to 10^{36} atoms/cm^2 s. Channeling RBS was also used to study the effect of thermal pulse annealing on boron implanted material. The rate of change of the minimum yield (χ_{min}) with depth, which can be related to certain types of damage, was consistent with the calculated implant damage profile. A 260°C 8 s anneal restored the crystal quality to better than the as-received material, as observed by channeling. (16 refs.)

119041 Infrared rapid thermal annealing for GaAs device fabrication. H.Kohzu, M.Kuzuhara, Y.Takayama (Microelectronics Res. Lab., NEC Corp., Kawasaki, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.4998-5003 (Sept. 1983).
A new post-implantation annealing technique, called infrared rapid thermal annealing (IRTA), is discussed for fabricating GaAs devices using ion implantation technology. The IRTA apparatus and capless annealing conditions are described. Also, electrical property and its uniformity of *n* or n^+ type GaAs layers made by Si implantation to semi-insulating GaAs followed by IRTA are presented, and compared with those made by Si_3N_4 capped furnace annealing. A steeper carrier concentration profile with a higher peak carrier concentration in the *n* type active layer made by IRTA results in a higher transconductance without any anomalous characteristics on the GaAs metal-semiconductor field-effect transistor. (13 refs.)

119042 Doping kinetics of polyacetylene in the short range. E.Cernia, L.D.D'Ilario, E.Ferretti, G.Nencini (Assoreni, Rome, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.167-70 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The kinetics of doping with iodine of polyacetylene (PA) films, synthesized by the Shirakawa technique, (1974) have been investigated by measuring the variation of electrical conductivity and IR absorbance at 1400, 1023 and 750 cm^{-1} within the time range of the first minute of doping. The experimental data suggest that the doping process occurs within at least three steps whose rate constants differ by orders of magnitude. An attempt is made to elaborate

a kinetic model for the doping process and the activation energies are calculated. (14 refs.)

119043 Iron (III) perchlorate doping of polyacetylene. J.R.Reynolds, J.C.W.Chien, F.E.Karasz (Dept. of Polymer Sci. & Engng., Univ. of Massachusetts, Amherst, MA, USA), C.P.Lillya, D.J.Curran.
J. Phys. Colloq. (France), vol.44, no.C-3, p.171-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Free standing films of polyacetylene have been oxidized with $Fe(ClO_4)_3$ to yield materials exhibiting high electrical conductivity thus providing an alternative route to the electrochemical p-doping with perchlorate anion. (8 refs.)

119044 Stability of polyacetylene doped by ion implantation. J.Davenas, X.L.Xu (Dept. de Phys. des Materiaux, Villeurbanne, France), M.Maitrot, M.Gamoudi, G.Guillaud, J.J.Andre, B.Francois, C.Mathis.
J. Phys. Colloq. (France), vol.44, no.C-3, p.183-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The introduction of doping impurities in polymers such as $(CH)_x$ can induce n or p type semiconducting properties or a metallic regime when increasing the concentration. The authors present some new results on the stability of $(CH)_x$ films doped by ion implantation, with respect to: (1) the degradation induced by the ionic irradiation, (2) oxidation, (3) thermal annealings. For that purpose two types of techniques have been used: (1) modification of the electrical conductivity and (2) nuclear microanalysis for depth profiling of the different elements. In particular the nuclear resonance at 6385 keV of ^{15}N was used to determine the hydrogen composition of the matrix as a function of the depth. The repartition of the different doping species and the evolution with annealings was studied by Rutherford backscattering spectroscopy (RBS). (12 refs.)

119045 Doping of $(CH)_x$ films with lanthanides salts. D.Boils, F.Schue, J.Sledz (Lab. de Chimie Macromoleculaire, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.189-92 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Studies on polyacetylene doped with $MoCl_5$, SbF_5, have shown, first, that during desorption under vacuum weight decrease of the samples was low; second, that these compounds induce a stabilization of the polyacetylene in what concerns the conductivity. The authors have extended these studies to rare earth salts to see their eventual stabilization effect on polyacetylene. (3 refs.)

119046 Features of defect formation during ion implantation and during post-implantation annealing of semiconductor A^3B^5 compounds. Yu.A.Danilov, S.K.Maksimov, P.V.Pavlov.
Radioelectron. & Commun. Syst. (USA), vol.25, no.7, p.98-100 (1982). Translation of: *Izv. VUZ Radioelektron. (USSR)*, vol.25, no.7, p.88-9 (1982). [received: Oct. 1983]
The formation of defects during ion doping and annealing has only been investigated for silicon, although even in this case there is still a number of unsolved problems. There are no review papers on the formation of defects in A^3B^5 materials. The authors compare the features of the defect structure during ion implantation and post-implantation annealing for gallium arsenide and indium antimonide. (6 refs.)

119047 Radiation damage and near-edge optical properties of ion-implanted gallium arsenide. W.Wesch, W.Wilk, K.Hehl (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.65-70 (1983). In English.
Measurements of optical transmission and Rutherford backscattering experiments (RBS) were carried out to investigate the correlation between different defect structures and the near edge optical properties of ion implanted GaAs. Photon-energy as well as dose dependence of the near edge absorption coefficient K can be described by superposition of two exponential functions with characteristic energies E_1 and E_2 which characterize the states of weakly damaged and amorphous layers. The results indicate the existence of two basic absorption processes in ion implanted GaAs. (11 refs.)

119048 Chemical etching behaviour of ion-irradiated SiO_2. J.Mittenbacher, E.Sennewald, B.Wiedemann (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.71-5 (1983). In English.
Damage of thermally grown SiO_2 by ion implantation enhances the dissolution in acidic fluoride solutions. Depth profiles of the etching rate agree with theoretical calculations of the energy deposition into atomic displacements. The influence of the chemical nature of the most usual dopants B and P on the etching behaviour is interpreted in terms of the molar composition of the etchants. (11 refs.)

119049 Depth profile of hydrogen in thin films with elastic recoil detection technique. Cheng Huansheng, Zhou Zhuying, Xu Zhiwei, Ren Yiehua, Yang Fujia (Fudan Univ., Shanghai, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.203-10 (Aug. 1983). In Chinese.
An elastic recoil detection technique for the depth profile measurement of hydrogen in thin films by using a Van de Graaff accelerator is described. $^4He^+$ ions of energy 2.1 MeV are used on the target tilted at an angle of 75°. The energy analysis of H forward scattered yields a depth resolution of ≤ 500 Å near the surface regions and a sensitivity of 0.1 at.% for ^1H to depths of ≤ 0.5 μm in solids. This method has been used for the depth profile measurement of hydrogen in plasma deposited a-Si and silicon nitride films with combined Rutherford backscattering and nuclear reaction $^{16}O(d,p)^{17}O$ techniques. The relations between the quantity of hydrogen in a-Si and substrate temperature are presented. (11 refs.)

119050 Analysis of hydrogen concentration and its depth profile in solid with detection of H(d,p) recoil. Guo Qingjiang, Yang Zhuqing, Lu Xiuqin, Zhao Kui, Cheng Yehao, Han Shukui, Yu Quan, Jiang Chenglie (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.211-16 (Aug. 1983). In Chinese.
A method of analyzing the hydrogen content in solid material using recoil detection in H(d,p) scattering induced by low energy deuteron is described. The sensitivity of this method is 200 ppm for silicon specimen. The depth resolution is about 0.28 μm and the maximum depth which can be measured is 1.5 μm. (8 refs.)

119051 Lateral spreads of Be and Si in GaAs implanted with a maskless ion implantation system. E.Miyauchi, H.Arimoto, Y.Bamba, A.Takamori, H.Hashimoto, T.Utsumi (Optoelectronics Joint Res. Lab., Kawasaki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L423-5 (July 1983).
Submicron Si and Be ion beams have been implanted into GaAs using a 100 kV maskless ion implantation system with a liquid metal ion source which is capable of emitting double ion species (Si^{++} and Be^{++}). Both ion beams are implanted at 160 keV with the dose of 10^{12} to 10^{15} cm^{-2}. The profiles of the implanted dopants have been estimated by observing the stain etching patterns on the cleaved planes before and after annealing. It has been found that high dose implantation results in a considerable lateral impurity spread of 1 μm or more, even with the focused ion beams having a diameter of 0.1 μm. However, doping of submicron width can be realized with relatively low doses or with shallow implantation. (8 refs.)

119052 Some aspects of Li behavior in ion implanted HgCdTe. L.O.Bubulac, W.E.Tennant, R.A.Riedel, J.Bajaj, D.D.Edwall (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1646-50 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
SIMS has been used on both unimplanted and B-ion implanted LPE grown HgCdTe to study the distribution of the Li impurity background. In unimplanted layers Li decorates some types of crystal defects and also reflects the *p/n* distribution in the layer. In implanted layers Li decorates the implantation-induced damage and also reveals the junction region. Ion implanted junctions have been evaluated by Hall, differential Hall, EBIC, *C-V*, and TEM techniques and the results correlated with the features exhibited by the Li distribution. The Li distribution analysis reinforces the previous understanding that implanted junctions are several microns deep, n^+/p^-, graded in the *p* region and formed by implant-induced native donors. 119053 Vacancy-impurity binding energy and the effective vacancy formation energy as determine from the solidus line for binary Al-based alloys. T.Gorecki (Phys. Lab., Higher School of Engng., Opole, Poland).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.801-3 (Sept. 1983).
The vacancy model of melting of metals has been used as a starting point for deriving the expressions permitting the determination of the vacancy-impurity binding energy, E_{v-i}^{b}, and the effective vacancy formation energy from the knowledge of the solidus line for binary alloys. The calculated values of E_{v-i}^{b} and E_{v}^{e} for binary Al-based alloys show a fair agreement with the experimental data existing in the literature. (36 refs.)

119054 Strengthening of GaAs by impurity atom-vacancy complexes. O.K.Gorodnichenko, E.A.Glushkov, V.F.Kovalenko, N.D.Vasilenko (Odessa State Univ., Odessa, USSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.331-5 (Sept. 1983).
Measurements are made of flow limits and photoluminescence spectra of n- and p-GaAs deformed by uniaxial tension. It is shown that long-wave radiation bands of higher intensity correspond to higher flow limit values, the intensity rising is due to an increase in the concentration of impurity atom-vacancy complexes ($Te_{As}V_{Ga}$, $Sn_{As}V_{Ga}$, etc.). The data obtained are proved by calculations made according to the model of strengthening the crystals by complexes. It is noted that in p-GaAs no complexes are found and its flow limit is lower than that in crystals having electron-type conductivity. (17 refs.)

A method and mathematical program are given for calculating the bend of a sufficiently thin plate under swelling and irradiation creep conditions. (8 refs.)

119057 Pulse heating regimes in semiconductors induced by irradiation. H.-D.Geiler (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.57-63 (1983). In English.
The manipulation of thermally activated processes by pulse-heating of semiconductors up to temperatures near the melting point has a growing importance for manufacturing integral circuits. The pulse regimes are derived from the consideration of the energy transport in a wafer subjected to a pulse irradiation. A classification of the process regimes is given by estimating the effect of characteristic thermally activated processes. For such a process in a semiconducting wafer it is then possible to select the parameters of the energy pulse and to choose the experimental equipment, inclusive of the working mode, by taking into consideration the possibilities of technical realization. 119058 Laser damage to transparent polymers in sharply focused single-mode beams. A.A.Manenkov, V.S.Nechitailo, A.S.Tsaprilov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.173-5 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.,* vol.44, no.8, p.1770-3 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Presents a detailed investigation of laser damage to polymers in sharply focused beams. The method of investigation was based on study of the morphology of the damage, the space-time characteristics of the emitted light, and the accumulation effect, which is a test for the influence of absorbing defects. The most characteristic representation of the clear plastics—specially purified polymethyl methacrylate (PMMA) and modified polymethyl methacrylate (MPMMA) with damage thresholds near that of K-8 silicate glasses—were chosen as objects for study. (5 refs.)

119059 A review of laser beam applications for processing silicon. I.W.Boyd (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
Contemp. Phys. (GB), vol.24, no.5, p.461-90 (Sept.-Oct. 1983).
The field of laser processing has expanded rapidly in recent years to become one of the most prolific areas in research in applied physics. This is mainly due to the novel conditions presented by typical laser treatments which have allowed previously unexplored regimes of material processing to be readily achieved. The author reviews the present status of research in the area of laser processing of silicon in its different forms and under various conditions which offer the prospect of important advances in microelectronics fabrication and crystal growth in general. The principal features of the more common modes of laser processing will be described, in conjunction with the widely accepted interpretations of their associated kinetics. The present controversy regarding the behavior of silicon under intense laser excitation has stimulated much theoretical interest in the subject, and this has additionally helped to bring about a better understanding of many related physical phenomena. (69 refs.)

119060 Thermal stability of electrically active dopants in laser annealed silicon films. S.R.Wilson, W.M.Paulson, R.B.Gregory, G.Tam (Semiconductor Res. & Dev. Labs., Motorola Inc., Phoenix, AZ, USA), C.W.White, B.R.Appleton, A.K.Rai, P.P.Pronko.
J. Appl. Phys. (USA), vol.54, no.9, p.5004-13 (Sept. 1983).
Single crystal Si wafers and polycrystalline Si films on Si_3N_4 have been implanted with large doses ($1\times10^{15}/cm^2$-$4\times10^{16}/cm^2$) of P or As and laser annealed with either a CW or pulsed laser. The samples were then subjected to thermal anneals between 450 and 900°C to determine the thermally stable dopant concentration for each sample. Sheet resistance and Hall measurements have been used to measure the electrical properties in each case. SIMS, RBS, and TEM have been used to measure atomic profiles, As substitutionality and residual defects after laser and thermal annealing. In each case the maximum electrically active dopant concentration achieved by laser annealing decreased after a 700-800°C thermal anneal. (23 refs.)

119061 Theoretical considerations regarding pulsed laser annealing of a-Ge layers on GaAs. A.Bhattacharyya (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA), B.G.Streetman.
J. Phys. D (GB), vol.16, no.10, p.2033-7 (14 Oct. 1983).
The thermal melting model has been widely used to explain the liquid phase epitaxial regrowth during pulsed laser annealing of ion implanted semiconductors. The authors present results of similar calculations regarding regrowth of epitaxial heterojunctions such as the Ge-GaAs system. They calculate the Nd:glass laser ($\lambda=1.06$ μm) fluences necessary to melt various thicknesses of the a-Ge layer and study the regrowth velocity. The high solidification rates can be used to produce metastable alloys which are conventionally produced by vapour phase quenching of nonthermal species. (13 refs.)

119062 Pulsed-laser annealing of GaAs surface studied by time-resolved second-harmonic generation in reflection. S.A.Akhmanov, N.I.Koroteev, G.A.Paitian, I.L.Shumay (Dept. of Phys., Moscow State Univ., Moscow, USSR), M.F.Galjautdinov, I.B.Khaibullin, E.I.Shtyrkov.
Opt. Commun. (Netherlands), vol.47, no.3, p.202-4 (1 Sept. 1983).
Experimental results are presented on the time dependence of the second-harmonic generation (SHG) of a mode-locked *Q*-switched Nd:YAG laser in reflection from both amorphous and crystalline GaAs surfaces during the pulsed-laser annealing under ruby laser irradiation. A dramatic increase of SHG for more than two orders of magnitude due to recrystallization of the noncentrosymmetric GaAs lattice in the process of pulsed-laser annealing is observed and the duration of surface recrystallization is measured to be not greater than 30-40 ns. The results can be fully understood in terms of the melting model of laser annealing. (10 refs.)

119063 Photostimulated diffusion in semiconductors. T.D.Dzhafarov (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.11-45 (Sept. 1983).
Reviews results of theoretical and experimental works, dedicated to the research on photostimulated processes (mainly diffusion, formation of defects, annealing of defects) in crystalline and amorphous semiconductors and their structures. (69 refs.)

119064 Annealing of implanted silicon under the action of microsecond pulsed TEA-CO_2 laser radiation. L.Nanu, D.Barbulescu, V.Mihailescu, V.Teodorescu, L.C.Nistor (Central Inst. of Phys., Bucharest, Rumania).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K5-8 (Sept. 1983).
A great interest arose in the last few years by the recrystallization of amorphous layers on the top surface of implanted semiconductor materials under the action of poweful laser radiation. The CW or pulsed laser irradiation actually results in either a solid-phase epitaxial regrowth or a liquid-phase process, respectively, depending on the temporal characteristics of the incident power. New results on annealing of implanted silicon samples, under the action of microsecond pulsed CO_2 laser radiation, are firstly reported. (9 refs.)

119065 Laser-induced damage in solids. Ramli bin Jaya.
Univ. Wales, Swansea thesis, March 1983
The author presents a study of the mechanisms involved in causing damage to optical components irradiated by 10.6 μm, 300 nsec flashes of infrared radiation from a single transverse mode carbon dioxide laser. Electron-microphotographs of the damage sites have been obtained for NaCl, KCl, Ge and GaAs and are used to describe the nature of the damage formation.

119066 ^{60}Co γ-ray and electron irradiation damage of GaAs single crystals and solar cells. M.Yamaguchi, C.Amano (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.5021-9 (Sept. 1983).
^{60}Co γ-ray and high energy electrons (0.8-4 MeV) irradiation damage of GaAs solar cells were examined. Changes in minority carrier diffusion length in irradiated GaAs single crystals were also investigated by electron beam and ^{60}Co γ-ray-induced current methods for solar cells. Damage constant of *p*-GaAs is smaller than that of *n*-GaAs. Equivalent damage rate in GaAs due to electron irradiation to ^{60}Co γ-ray irradiation damage was clarified experimentally and theoretically. Experimental results for radiation damage of GaAs solar cells were also in satisfactory agreement with theoretical values, calculated from change in minority carrier diffusion length due to irradiation. Radiation damage in GaAs solar cells can be evaluated by using radiation damage data in GaAs single crystals. In-depth profiles for electron irradiation damage in GaAs and annealing behavior of radiation damage in GaAs were also examined. (17 refs.)

119067 Effect of γ-radiation on the electrical properties of bulk amorphous $As_4Se_2Te_4$. M.H.El-Fouly, A.Z.El-Behay, S.A.Fayek (Nat. Centre for Radiation Res. & Technol., Atomic Energy Establ., Cairo, Egypt).
Radiat. Phys. & Chem. (GB), vol.19, no.1, p.57-61 (1982). [received: Oct. 1983]
The effect of γ-radiation on the electrical properties of bulk amorphous $As_4Se_2Te_4$ was studied in the temperature range from 330K down to 100K. The material was irradiated at room temperature and at annealing temperature (T_A) slightly less than the glass transition temperature. Absorbed doses at room temperature as high as 100 Mrad showed no effect on the electrical properties of the material all over the range of temperatures 100-330K. The relation between $\ln \sigma$ and $1/T$ of the samples irradiated under annealing temperature (T_A) showed lower activation energy and higher conductivity at temperatures below room temperature. There was a marked dependence between the conductivity of the irradiated material under annealing temperature and the absorbed radiation dose. (9 refs.)

119068 A study on electron injection in KBr single crystal. A.K.Maiti, K.Goswami, A.K.Lahiri (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Fizika (Yugoslavia), vol.15, no.3, p.247-53 (July-Sept. 1983).
A crystal of KBr is coloured by means of electron injection under elevated temperatures and applied voltages. The growth of space charge limited (*SCL*) current and colouration have been studied and the efficiency of *F* centre formation in *SCL* region was found to be anomalous near 748K. The roles of temperature and the injection voltage for the production of trapping centers have been discussed. (8 refs.)

119069 Radiation-induced mobility of lithium and sodium in alpha-quartz. K.B.Hitt, J.J.Martin (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5030-1 (Sept. 1983).
The radiation-induced release of the charge compensating ions Li^+ and Na^+ from the substitutional aluminum impurity in α-quartz has been investigated by measuring the growth of the infrared active $Al\text{-}OH^-$ center as a function of sample temperature during irradiation. It was found that Li^+ is released 10-15K lower in temperature than Na^+. (10 refs.)

119070 Carbon-related vibronic bands in electron-irradiated silicon. G.Davies, E.C.Lightowlers, M.do Carmo (Wheatstone Phys. Lab., King's Coll., London, England).
J. Phys. C (GB), vol.16, no.28, p.5503-15 (10 Oct. 1983).
Detailed measurements are presented for four independent optical centres with zero-phonon lines at 951.16, 952.98, 953.96 and 956.91 meV which are observed in 2 MeV electron-irradiated carbon-doped silicon. Uniaxial stress perturbations and carbon and silicon isotope effects are all shown to be very similar for these four centres and for the well known 969.45 meV centre, implying that all these centres are minor modifications of each other. A re-examination of the 969.45 meV vibronic sidebands observed in luminescence and absorption. (14 refs.)

119071 Radiation damage in epitaxial CaF_2 films on Si substrates by Ar^+ ion implantation. H.Ishiwara, K.Orihara, T.Asano (Graduate School of Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L458-60 (July 1983).
Radiation damage in epitaxial CaF_2 films on Si substrates produced by 150 keV Ar^+ ion implantation has been investigated using Rutherford backscattering and channeling techniques. It has been found that CaF_2 films are more stable than Si crystals for ion bombardment and are not amorphized at such a high dose as 6×10^{16} cm^{-2}. Recovery of the damage by subsequent thermal annealing has also been investigated. (8 refs.)

119072 Damage production in GaAs by H^+ irradiation. R.S.Bhattacharya (Universal Energy Systems Inc., Dayton, OH, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5039-42 (Sept. 1983).
Rutherford backscattering and proton induced X-ray emission in combination with channeling have been used to study damage production in GaAs by proton irradiation. The average cross section for displacement of Ga and As atoms has been determined and found to agree well with the cross section calculated from the elastic displacement theory of Kinchin and Pease. In addition, the authors have demonstrated that about 6% more Ga atoms are displaced than As atoms. (16 refs.)

119073 Kinetics of radiation-induced segregation in Ni-12.7 at.% Si. R.S.Averback, L.E.Rehn, W.Wagner, H.Wiedersich, P.R.Okamoto (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3100-9 (15 Sept. 1983).
The kinetics of radiation-induced segregation in Ni-12.7 at.% Si alloys was investigated using in situ, simultaneous Rutherford-backscattering spectrometry. It was observed that a precipitate layer of γ'-Ni_3Si grew at the specimen surface during 2.0-MeV He and 2.75-MeV Li irradiations. The thickness of the γ' layer was measured as a function of dose, dose rate, and temperature. For all of the irradiation conditions the γ' layer thickness grew proportionately to the square root of dose. The proportionality constant, or growth-rate constant, was dependent on temperature and dose rate. Below ~750°C the growth-rate constant displayed Arrhenius behavior with an apparent activation enthalpy of 0.30 ± 0.04 eV, and it depended approximately in the $-^1/_4$th power of the dose rate. Above 590°C the growth-rate constant also displayed Arrhenius behavior but with an apparent activation enthalpy of -0.75 ± 0.15 eV; moreover, it was independent of dose rate in this temperature regime. A simple model for radiation-induced segregation is described which relates the segregation results to high-temperature point-defect properties in alloys. It shows that the apparent activation enthalpy of the growth-rate constant at low temperatures is equal to $^1/_4$ the enthalpy of vacancy migration, and that at high temperatures it is equal to $-^1/_2$ the enthalpy of vacancy formation. The model also correctly predicts the observed dose-rate dependences of the growth-rate constant in the two temperature regimes. (24 refs.)

119074 Monte-Carlo calculations of keV electron and positron slowing down in solids. S.Valkealahti, R.M.Nieminen (Dept. of Phys., Univ. of Jyvaskyla, Jyvaskyla, Finland).
Appl. Phys. A (Germany), vol.A32, no.2, p.95-106 (Oct. 1983).
A Monte-Carlo simulation technique based on the screened Rutherford differential cross section for the elastic scattering and Gryzinski's semiempirical expression for the inelastic core and valence electron excitation is used to describe electrons and positrons slowing down in solids. The theoretical results are compared with the experimental backscattering, absorption and transmission results for aluminum, silicon, copper, and gold thin film and semi-infinite targets and good agreement is observed. The simulated stopping profiles are fitted with a simple analytic expression. The profiles are Laplace-transformed to give a useful data base for analyzing phenomena associated with slow positron re-emission from solids. (22 refs.)

119075 Average energy loss of 24.8-MeV electrons after passing through and backscattering from thick layers of C, Al, Cu, and Pb. T.Mikado, T.Tomimasu, T.Yamazaki (High-Energy Radiation Section, Electrotech. Lab., Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3003-9 (Sept. 1983).
Average energy losses (ϵ_{AV}) were evaluated from total energy spectra. The total energy spectra $F(E)$ are classified into two groups according to the composition procedure: (A) integrations of $f(E,\theta)$, representing energy spectra measured at various emission angles (θ) including backward angles, over θ, and (B) crude estimates based upon $f(E,0°)$ with reference to relations between $F(E)$ and $f(E,0°)$ for group A, where $f(E,0°)$ had been calculated by means of the Blunck-Leisegang-Westphal theory. The general trends of ϵ_{AV}/t_A vs. t_A, with t_A being the corrected path length of the electrons in a material, obtained from $F(E)$ for group B agree well with those for group A. The estimated values of ϵ_{AV}/t_A for C and Al are a little larger than those taken from the Berger-Seltzer table and those for Cu and Pb are a little smaller than the tabulated values. (21 refs.)

119076 Simulation of collision cascades in intermetallic V_2Hf compounds. V.G.Chudinov, V.P.Gogolin, B.N.Goshchitskii, V.I.Protasov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K57-60 (Sept. 1983).
The molecular dynamics technique is used to simulate a collision cascade in V_2Hf. The calculations were carried out on a crystallite of almost spherical shape which consisted of 3800 atoms, 2000 of which being located on the immobile wall. This wall allowed one to keep atoms of the mobile part during the calculation at the sites of the C-15 structure. The energy was removed from $\approx$400 atoms of the intermediate layer. The kinetic energy of these atoms could be decreased by a definite value at every time step. The rate of removal was taken equal to 0.9 taking into account the absence of highly energetic atoms from the hard wall. (5 refs.)

119077 Ion dechanneling due to lattice strains in semiconductor superlattices. J.H.Barrett (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2328-34 (1 Sept. 1983).
A new source has been considered for the unusual ion dechanneling found in InAs-GaSb superlattices. This new source stems from the strains that occur in the layers because of the slight mismatch between the lattice constants of the two materials. The strains cause the rows and planes of atoms in the crystal that are inclined to the surface normal to have small directional misalignments at the interfaces between the layers. The effects of these misalignments have been incorporated into computer simulations of ion trajectories in the crystal and have been shown by means of the simulations to account in a reasonable manner for the observed dechanneling behaviour. Two ways of measuring the amount of misalignment are suggested as a result of the simulations. Calculations have also been done as a function of the amount of misalignment to give some indication of how much dechanneling might be expected for superlattices composed of other pairs of materials with different degrees of mismatch. (18 refs.)

119078 Determination of the parameters of diffraction channeling of electrons in single crystals from the backscattering energy spectra. V.P.Artem'ev, V.V.Makarov, N.N.Petrov, O.A.Podsvirov (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.390-4 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.684-91 (March 1983). [received: Oct. 1983]
A new method is proposed for the determination of the parameters of diffraction channeling of electrons in bulk single crystals. This method is based on an analysis of the orientational contrast of a series of plasmon loss peaks in the backscattering energy spectra. The method is applied to the experimental data obtained for amorphous and single-crystal silicon on which electrons of energies ~10 keV are incident. The results are interpreted using two- and three-wave approximations of the dynamic theory of diffraction. The absorption coefficients of Bloch waves, the extinction length for the 220 reflection, and the corresponding Fourier components of the crystal lattice potential are determined. It is shown directly that the electron channeling effect becomes weaker near the surface of a crystal, in agreement with the model of a single wave field. (14 refs.)

119079 Excess volumes of binary mixtures of cyclohexanone with some monosubstituted benzenes at 298.15K. B.Chawla, S.K.Mehta, R.V.Jasra, S.K.Suri (Dept. of Chem., Indian Inst. of Technol., New Delhi, India).
Can. J. Chem. (Canada), vol.61, no.9, p.2147-50 (Sept. 1983).
Molar excess volumes for the binary mixtures of cyclohexanone with benzene and some monosubstituted benzenes, namely, toluene, ethylbenzene, isopropylbenzene, tertiary butylbenzene, chlorobenzene, bromobenzene, iodiobenzene, *N,N*-dimethylaniline, nitrobenzene, benzaldehyde, and benzonitrile have been calculated from the precise and accurate experimental density data at 298.15K over the entire composition range. The results have been discussed in terms of the strength of molecular interactions in the binary mixtures. (15 refs.)

119080 Density of liquid $Hg_{1-x}Cd_xTe$. D.Chandra, L.R.Holland (Space Sci. Lab., NASA Marshall Space Flight Center, Huntsville, AL, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1620-4 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Negative thermal expansion has been established in liquid $Hg_{1-x}Cd_xTe$ for $x<0.2$ employing a pycnometric method. Pure HgTe increases in density from its melting point at 670°C to a maximum value at ~750°C, where normal thermal expansion progressively resumes. The dependence of density on temperature for liquid $Hg_{1-x}Cd_xTe$ arises almost exclusively from the HgTe portion of the melt, while CdTe acts as a diluent. The temperature corresponding to the maximum density changes slightly with composition, increasing by about 5°C for $x=0.1$. (13 refs.)

119081 Molar volumes and fluidities of seed oils and their fatty acids. N.Islam, I.Ahmad (Dept. of Chem., Aligarh Muslim Univ., Aligarh, India).
Indian J. Chem. A, vol.22A, no.3, p.229-30 (March 1983). [received: Oct. 1983]
The densities and viscosities of the seed oils of Vernonia anthelmintica (A), Leucas caphalotes (B), and those of their component fatty acids, viz. palmitic, oleic, stearic and myristic acids, are measured over the temperature range 298-433K. These data are least-squares-fitted to equations of relevance. The Hildebrand equation seems to be better than that of Doolittle in explaining the data. The temperature dependence of the energies of activation is described by a parabolic equation. (8 refs.)

119082 Volumetric and dielectric properties of benzene solutions of some tri-n-alkylammonium halides at 298.15K. C.Klofutar, S.Paljk (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2377-87 (Oct. 1983).
The densities of benzene solutions of tri-n-alkylammonium bromides and tri-n-alkylammonium iodides up to 0.100 mol. kg^{-1} and the electric permittivities at 2 MHz of benzene solutions of tri-n-alkylammonium chlorides, bromides and iodides up to $X_2=0.005$ (ca. 0.065 mol. kg^{-1}) in a homologous series from the tri-n-propylammonium to the tri-n-dodecylammonium salt have been measured at 298.15K. The molar polarizations of the solutions and the partial molar polarizations, partial molar volumes and dipole moments of the solutes have been calculated. From the dipole moments of the solutes at infinite dilution the interionic distances in the ion pairs, the total electrostatic interaction energies and the interaction energies due to the mutual polarizations of ions in ion pairs have been calculated; the results are discussed on the basis of self-aggregation processes of solute molecules. (30 refs.)

119083 Elastic deformations and electrohydrodynamic instabilities in large pitch cholesteric liquid crystals under an electric field. M.L.Sartirana, B.Valenti (Istituto di Chimica Industriale, Univ. di Genova, Genova, Italy), R.Bartolino.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.321-47 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Reports experimental observations on large pitch cholesteric liquid crystals in the planar geometry submitted to DC or low frequency AC field applied along the helical axis. An electric field can cause orientation of the molecules in the field direction or disruption of the orientation due to the hydrodynamic effect of current carriers. The behavior of the samples depends upon the sign and the absolute value of the dielectric anisotropy ϵ_a. The authors have investigated a wide range of systems by using nematic matrices with ϵ_a between -4 and $+33$ doped with small amounts of cholesteryl chloride and cholesteryl benzoate. Instabilities are observed in negative ϵ_a mixtures; depending upon the frequency, two regimes can be found, as in nematics. The behavior about threshold depends largely on the magnitude of the negative anisotropy. In the case of a small positive ϵ_a, domain instabilities and elastic deformations occur. (40 refs.)

62.20 MECHANICAL PROPERTIES OF SOLIDS (RELATED TO MICROSCOPIC STRUCTURE)

(see also 81.40 Treatment of materials and its effects on microstructures and properties, 81.70 Materials testing)

119084 Dependence of the specific volume of the bisphenol-A polycarbonate on its molecular characteristics. Z.Dobkowski, D.Grzelak (Inst. Chem. Przemyslowej, Warszawa. Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.2, p.44-6 (Feb. 1983). In Polish. [received: Oct. 1983]
The dependence of the specific volume of the linear polydisperse bisphenol-A polycarbonate (PC) on its molecular weight and molecular weight distribution has been described. The Fox-Flory relationship, valid for polystyrene above its glass transition temperature, $v=A_0+A_1/M$, holds for amorphous PC at 23°C, i.e. below the glass transition temperature of PC. The following values of the constants for PC were calculated: $v_\infty=0.8338$ cm^3/g, $\rho_\infty=1.1993$ g/cm^3 and $A_1=27.15$ $cm^3/mole$. (10 refs.)

119085 Temperature dependence of the theoretical strength of simple cubic lattices. V.L.Gilyarov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.544-5 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.944-6 (March 1983). [received: Oct. 1983]
Problems of the temperature-dependent strength of solids (the upper limit of stability with respect to lattice dynamics as the basis for the thermal fluctuation treatment of fracture) have recently been much discussed. The author gives the results of calculating the theoretical strength of simple cubic lattices in the nearest neighbor approximation on the basis of the self-consistent method. (5 refs.)

62.20D Elastic constants

(see also 03.40D Mathematical theory of elasticity, 81.40J Elasticity and anelasticity)

119086 Third-order elastic coefficients of NaCl and KCl and invariance relations. P.Hegedus, S.Kolnik, C.Musil, I.Varga (Katedra Fyziky VSDS, Zilina, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.283-91 (1983).
An experimental research of third order elastic coefficients of NaCl and KCl crystals at room temperature has been carried out. Ultrasonic velocities and their pressure changes were appreciated by using acoustic invariance relations for second and third order elastic coefficients. The obtained values of the third order elastic coefficients are compared with the values reported by other authors. (8 refs.)

119087 Ultrasonic investigations of incommensurate $(NH_4)_2BeF_4$. U.Straube, D.Grutzmann, G.Sorge (Sektion Phys., Martin-Luther-Univ. Halle-Wittenberg, Halle/Saale, Germany).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.315-19 (1983).
The elastic stiffness coefficient c_{66} of AFB in its incommensurate phase and near the paraelectric-incommensurate and incommensurate-ferroelectric phase transition was determined by ultrasonic measurements at 20 MHz. An anomaly in the temperature dependence of this coefficient and the corresponding attenuation coefficient near the lower phase transition could not be detected in contrast to the suggestions of Petzelt and the results on other substances with an incommensurate phase. (14 refs.)

119088 Polarization effects in a layer system with elastic anisotropy. I.Cap, S.Kolnik (Dept. of Phys., Tech. Univ. of Advanced Transport & Communication Engng., Zilina, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.337-41 (1983).
Deals with a method of measuring the thickness of anisotropic layers. The interference of two acoustic pulses corresponding to two independent shear modes in an anisotropic medium is utilized. Direct electromagnetic generation and detection of acoustic waves in a metal medium in the presence of a constant magnetic field are used. The theoretical considerations are verified by an experiment. (2 refs.)

119089 Determination of nonlinear elastic coefficients by resonant methods. A.A.Demidenko, A.P.Zdebskii, V.N.Piskovoi, A.U.Savchuk (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K73-6 (Sept. 1983).
A resonant method of calculation and experimental investigations of third-order elastic coefficients are carried out for polycrystalline $BaTiO_3$ with additions of CeO_2 (temperature of ferroelectric phase transition $T_c=33°C$) in the paraelectric region where this material is non-piezoelectric. After applying a constant electric field E° to the specimen it may be regarded as a transverse-isotropic one with axis of symmetry (index 3) parallel to E°. (5 refs.)

119090 Elastic constants of citric acid monohydrate. Md.Shahabuddin Khan, T.S.Narasimhamurty (Univ. Coll. of Sci., Osmania Univ., Hyderabad, India), Y.V.Ramana.
Solid State Commun. (USA), vol.48, no.2, p.169-72 (Oct. 1983).
All the elastic constants of citric acid monohydrate (CA) single crystal of (D_2) class of orthorhombic system determined at room temperature are reported. These constants have been computed from compressional and shear wave velocity measurements along different directions of propagation in (CA) single crystals using two separate dynamic methods—the pulse transmission method and the thickness resonance method. The values of linear compressibilities, volume compressibility and Poisson's ratios for (CA) single crystal at room temperature have also been deduced. (10 refs.)

62.20F Deformation and plasticity

(inc. yield, ductility and superplasticity; see also 81.40L Deformation, plasticity and creep)

119091 Deformation of α-β brass with oriented and equiaxed duplex boundaries. C.F.Nilsen, K.N.Subramanian (Dept. of Metallurgy, Mech. & Materials Sci., Michigan State Univ., East Lansing, MI, USA).
Phys. Status Solidi a (Germany), vol.79, no.1, p.281-92 (Sept. 1983).
As an extension of investigations dealing with two-phase bicrystals of α-β brass, tensile testing is carried out at various strain rates on α-β brass specimens with oriented duplex and equiaxed duplex boundary geometries. The equiaxed boundary is more effective in blocking the propagation of deformation from α to β phase. A strain-rate sensitivity is found in all specimens regardless of boundary geometry. At low-strain-rates, both boundaries are found to be ineffective barriers to the propagation of deformation. At high strain-rates both boundaries fully resisted the passage of deformation. In the α phase at low strain-rates coarse slip is observed, while at high strain-rates fine slip occurs. Optical and scanning electron microscopic techniques are used to study the microstructural features of deformation. (35 refs.)

62.20H Creep

(see also 81.40L Deformation, plasticity and creep)

119092 On the applicability of a phenomenological relationship to creep at low stresses and intermediate temperatures. T.Sritharan, H.Jones (Dept. of Metall., Univ. of Sheffield, Sheffield, England).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.1-5 (Oct. 1983).
In a recent paper (see ibid., vol.56, p.167, 1982) Ruano and Sherby used a phenomenological relationship of the form $\dot{\epsilon}\propto\sigma^2$ derived from superplasticity data to reinterpret some data for creep at low stresses. These data had been represented previously in the form $\dot{\epsilon}\sigma$-σ_0 with σ_0 as the threshold stress for the operation of vacancy diffusion creep. The present authors show that $\dot{\epsilon}\propto\sigma^2$ in fact gives a poorer representation of these creep data than does $\dot{\epsilon}\propto\sigma$-$\sigma_0$. This conclusion is based on (i) the marked curvature of plots of $\dot{\epsilon}^{1/2}$ versus σ consistent with $\epsilon\propto\sigma$-σ_0, (ii) the unit slope of log $\dot{\epsilon}$ versus log(σ-σ_0) plots and (iii) the creep rates observed which are two to three orders of magnitude larger than those predicted by the phenomenological relationship when used with the empirical diffusion coefficient D with which it was originally established. Use of this original D also virtually eliminates from their deformation map the field of dominance over Coble creep of the mode of deformation represented by $\dot{\epsilon}\propto\sigma^2$. Analysis finally shows that, when interpreted as $\dot{\epsilon}\propto\sigma$-$\sigma_0$, the phenomenological relation should give an apparent σ_0 which is independent of grain size, contrary to what is observed. 62.20M Fatigue, brittleness, fracture, and cracks

(inc. hardness; see also 81.40N Fatigue, embrittlement and fracture)

119093 A fracture mechanics study of the fatigue of rubber in compression. A.Stevenson (Malaysian Rubber Producers' Res. Assoc., Hertford, England).
Int. J. Fract. (Netherlands), vol.23, no.1, p.47-59 (Sept. 1983).
Repeated deformation of rubber cylinders in compression causes cracks to initiate at tensile stress concentrations (e.g. bond edges). The cracks grow to remove the rubber which at maximum deformation bulges outside the original profile of the cylinder. The results are analysed in terms of fracture mechanics. The tearing energy, T, is substantially independent of crack length. The relation between crack growth rate dc/dN and T appears to be a material property, independent of testpiece geometry. (9 refs.)

119094 Beryllium fracture observed by in situ high voltage electron microscopy. T.C.Pollock (Engng. Design Graphics Dept., Texas A&M Univ., College Station, TX, USA), H.G.F.Wilsdorf.
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.7-15 (Oct. 1983).
Beryllium single crystals were stained to fracture in a high voltage electron microscope and were studied using in situ and analytical techniques. The crystals were oriented so that the stress axis was parallel to the basal planes, thereby activating the prism planes of the first order during plastic deformation. Resulting dislocation cells were characterized and slip traces on external and fracture surfaces were analyzed. Microcracks were seen to initiate at dislocation cell walls and mostly continued to propagate along them. A pseudocleavage mechanism for microcracks has been discussed. (17 refs.)

119095 Change in effective cross section of cracks in the process of deformation of ice. V.P.Epifanov, M.A.Faustov.
Mech. Solids (USA), vol.17, no.6, p.156-62 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.171-6 (1982). [received: Oct. 1983]
In this study, by means of an experimental investigation of the deformation characteristics and the parameters of probe pulses and acoustic emission signals, the authors determined the dimensions, orientation, and law of accumulation of cracks forming under uniaxial compression of specimens. The relationship between the acoustic variables and the formation and accumulation of cracks is established in model experiments involving cracks that were artificially introduced into the specimens (either mechanically or by means of a laser signal). (12 refs.)

119096 A theory of mechanical properties of amorphous solids. I.A.Akhiezer.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1399-402 (Sept. 1983). In Russian.
Amorphization is analyzed as affecting breaking mechanical stresses, elastic moduli and densities of solids. It is shown that with equal short-range orders the nominal breaking stress and Young's modulus are amorphization-independent and controlled only by the specimen density. When there are no extended defects in amorphous solids, the breaking stresses for them are controlled by nominal hardness and can significantly exceed the breaking stresses for crystalline modifications of the same material. (see also 03.40K Mathematical aspects)

119097 Temperature dependence of the attenuation and the velocity of longitudinal elastic waves in polymers and acoustic estimation of their strength at 4.2K. V.I.Utchastkin (Dept. of Phys., Moscow Inst. of Advance Transport Engng., Moscow, USSR).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.365-8 (1983).
The temperature investigation of the attenuation and the velocity of longitudinal elastic waves in some solid polymers are reported. Polymer classification of three groups is explained on the basis of one-dimensional crystal grating model calculation of the elastic wave velocity. The data of the elastic wave velocity and strength are compared at the temperature of 4.2K. The polymer strength estimation method using acoustic parameters is shown. (5 refs.)

119098 Elastic properties of proustite. Yu.F.Gorin, L.Ya.Kobelev, A.N.Babushkin, Yu.S.Kuznetsov (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.531-2 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.922-4 (March 1983). [received: Oct. 1983]
The authors have investigated the temperature dependences of the velocities of propagation of elastic waves in the well-known ferroelectric semiconductor proustite Ag_3AsS_3. Longitudinal and transverse elastic waves traveled along the C_3 axis of the crystal lattice. Measurements were made by the pulse-phase method at frequencies of about 5 MHz, which made it possible to determine the relative changes in the velocity of an ultrasonic wave with an accuracy of at least 0.02%. The absolute values of the velocities measured at 300K were 2.7×10^3 and 1.2×10^3 m/sec for the longitudinal v_L and transverse v_T ultrasonic waves, respectively. (9 refs.)

62.40 ANELASTICITY, INTERNAL FRICTION, AND DAMPING

(see also 81.40J Elasticity and anelasticity)

119099 Thermostimulated creep study of undoped polyacetylene $(CH)_x$ films. T.Elsayed, J.Elhout (Lab. de Phys. des Solides, Univ. Paul Sabatier, Toulouse, France), B.Francois, C.Mathis, D.Chatain, C.Lacabanne.
J. Phys. Colloq. (France), vol.44, no.C-3, p.131-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The anelastic properties of undoped polyacetylene films have been followed during isomerization and thermal treatment between 77 and 433K by the thermostimulated creep TSC technique. The TSC spectra of the trans isomer show three retardation modes: between 110-160K, between 270-330K and over 400K. The two modes at lower temperature have two components. Each one has been experimentally resolved into elementary processes characterized by retardation times following a compensation law. (10 refs.)

119100 High-temperature internal friction peaks of pure aluminium. K.Iwasaki (Inst. of Phys. & Chem. Res., Saitama, Japan).
Phys. Status Solidi a (Germany), vol.79, no.1, p.115-24 (Sept. 1983).
The effects of deformation and successive annealings on the high temperature internal friction peak (so-called grain boundary peak) of pure aluminum are investigated. The peak is divided into two components, a low and a high temperature component, with the use of differentiated vibration period. The former and the latter components are considered to be related with lattice dislocations and grain boundary dislocations, respectively. (24 refs.)

119101 Investigation of the amplitude-dependent internal friction during plastic deformation of sodium chloride single crystals. A.B.Lebedev, S.B.Kustov, B.K.Kardashev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.511-12 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.890-2 (March 1983). [received: Oct. 1983]
The authors deal with changes in the amplitude dependences of the internal friction in a crystal being deformed. They have measured the internal friction using apparatus controlled automatically with an Elektronika D3-28 microcomputer. The response of the automated apparatus enabled them to determine one amplitude dependence with a sufficient number of experimental points (~100) in about 20 sec. Static deformation took place in an Instron (model 1341) machine and it involved three-point bending. (7 refs.)

62.50 HIGH-PRESSURE AND SHOCK-WAVE EFFECTS IN SOLIDS

119102 Anisotropic elastic limits and phase transitions of rutile phase TiO_2 under shock compression. T.Mashimo, K.Nagayama (Faculty of Engng., Kumamoto Univ., Kumamoto, Japan), A.Sawaoka.
J. Appl. Phys. (USA), vol.54, no.9, p.5043-8 (Sept. 1983).
Anisotropic elastic limits and phase transitions of the rutile phase TiO_2 under shock compression are studied, on the basis of the measurements of particle-velocity histories and free-surface motions along the [100], [110] and [001] axis directions in the stress range up to 38.6 GPa. The stresses of the Hugoniot elastic limit (HEL) along the [100] and [001] axis directions are determined to be 7.8 ± 0.5 and 4.1 ± 0.3 GPa, respectively. These different HEL stresses are reasonably analyzed by an inherent yield stress of 3.0 ± 0.3 GPa. A Hugoniot kink at 12.2 ± 0.6 or 17.0 ± 0.7 GPa along the [100] or [110] axis direction, respectively, and two kinks at 10.6 ± 0.5 and 33.7 ± 1.3 GPa along the [001] axis direction are observed. Considering the volume changes and the recovery experiments of the α-PbO_2 phase, two former ones and the last one are suggested to correspond to the beginning of phase transitions to a α-PbO_2 phase and a hexagonal phase, respectively. These anisotropic behaviors clearly show the typical evidences of the uniaxial strain effects of shock wave metamorphism of crystals. (17 refs.)

62.60 ACOUSTIC PROPERTIES OF LIQUIDS

(see also 62.80 Ultrasonic relaxation; for sound propagation, see 43.; for second sound in quantum fluids, see 67.40, 67.50 and 67.60)

119103 Free volume and internal pressure of liquid mixtures from ultrasonic velocity of different temperatures. N.Prasad, S.Singh (G.B. Pant Univ. of Agriculture & Technol., Pantnagar, India).
Acoust. Lett. (GB), vol.6, no.12, p.182-4 (June 1983).
The free volumes and internal pressures of mixtures of triethylamine (TEA)+methanol, triethylamine+ethanol and triethylamine+n-propanol have been computed from ultrasonic velocity, density and viscosity data at 303.15K, 308.15K and 313.15K and the results have been plausibly explained in terms of molecular interactions. (11 refs.)

119104 Absorption of longitudinal ultrasonic waves in polymer solution (polymethyl methacrylate). M.A.Sidkey, A.M.Abd El-Fattah (Nat. Inst. of Standards, Cairo, Egypt).
Fizika (Yugoslavia), vol.15, no.3, p.239-45 (July-Sept. 1983).
Measurements of the change of absorption coefficient of longitudinal ultrasonic waves were carried out over the temperature range from 10°C to 50°C in a 2% solution of polymethyl methacrylate in benzene irradiated with intense ultrasonic waves. The ultrasonic absorption measurements were performed by the pulse technique at frequencies of 2.5, 4, and 6 MHz. A marked change in absorption coefficient was observed as the temperature, and intensity of ultrasonic waves increased. A qualitative discussion is given on the assumption that the structural changes induced by intense ultrasonic waves, as well as by the temperature are related to changes in the number of degraded groups in the polymeric network. (12 refs.)

119105 Ultrasonic study of critical behavior in the binary liquid 3-methylpentane+nitroethane. C.W.Garland, G.Sanchez (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3090-9 (15 Sept. 1983).
The acoustic velocity and attenuation have been measured in a critical mixture of 3-methylpentane+nitroethane over the frequency range 1-17 MHz and the temperature range $0.004\leq T-T_c\leq13.5$K. No critical dispersion was observed in the velocity, which varied linearly with T. A substantial critical attenuation was well characterized as a function of the reduced frequency $\omega^*\equiv\omega/\omega_D$ over the range $10^{-1}\leq\omega^*\leq10^6$. The experimental data in this system are extensive enough to permit quantitative tests of the predictions of dynamic scaling theory, dynamic renormalization-group theory, and several versions of mode-coupling theory. Universality in the scaling function for the critical attenuation is demonstrated by comparison with comparable experimental in two pure fluids. (41 refs.)

119106 Critical ultrasonic attenuation in the binary liquid cyclohexane+-nitroethane. G.Sanchez, C.W.Garland (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3100-3 (15 Sept. 1983).
The ultrasonic velocity and attenuation have been measured in the critical binary mixture cyclohexane+nitroethane over the frequency range 3-27 MHz and the temperature range $0.01\leq T-T_c\leq15$ K. The sound velocity varies linearly with T and shows no critical dispersion in this frequency range. The critical attenuation is analyzed in terms of the dynamic scaling theory of Bhattacharjee and Ferrell. In general, the agreement between theory and experiment is good but the data conform to an empirical scaling function that differs in small but systematic ways from the theoretical scaling function. Universality in the critical acoustic behavior is demonstrated by a comparison of the scaled attenuation in three binary liquid systems with that in two pure fluids. (12 refs.)

119107 Acoustical study of aqueous solutions of sodium sulphate and thiosulphate. S.B.Grigor'ev, K.N.Marenina, I.G.Mikhailov, A.K.Partman, L.I.Savina.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.94-6 (Aug. 1983). In Russian.
Ultrasonic propagation in aqueous solutions of sodium sulphate and thiosulphate has been studied as a function of concentration and frequency. Adiabatic compressibilities are calculated from ultrasonic velocity data. Measurements of ultrasonic absorption have been carried out in the frequency range 4-930 MHz. In sodium thiosulphate solution single relaxation is found near 600 MHz. Sodium sulphate solution has two relaxation frequencies about 40 MHz and 600 MHz respectively. Rate constants and volume effects of association reactions are calculated. (10 refs.)

119108 Experimental determination of ultrasonic velocity in liquid N_2O_4 at temperatures of 282-417K and up to 80 MPa pressure. O.V.Belyaeva, V.A.Nikolaev, V.I.Struchkov, V.D.Timofeev.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.50-4 (1983). In Russian.
The experimental data on acoustic velocities in liquid nitrogen tetroxide in the temperature range 282-417K and pressure range 1-80 MPa have been obtained on an ultrasonic interferometer with 0.16% error. The results at the temperatures above 360K have been obtained for the first time. The

experimental data for the test range of state parameters are described in terms of an interpolation polynomial. (7 refs.)

119109 On the correspondences between experimental sound velocities in liquid N_2O_4 with density and specific heat. O.V.Belyaeva.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.65-8 (1983). In Russian.
On the basis of analysis of the interpolating equation of state for liquid nitrogen tetroxide obtained by joint treatment of data on density, sound velocity and isobaric heat capacity, conclusions have been drawn about consistency of these values in the range of experimental study within the limits of experimental error. A table of calculated values of isochoric heat capacity is given. (10 refs.)

62.65 ACOUSTIC PROPERTIES OF SOLIDS

(see also 62.80 Ultrasonic relaxation; for sound propagation, see 43.; for lattice dynamics and phonons, see 63.; for magnetoacoustic effects, see 72.55; for acoustoelectric effects, see 72.50; for acousto-optical effects, see 78.20H)

119110 Surface acoustic wave measurements by phase sensitive optical detection. K.Capova (Dept. of Theoretical Electrotech. & Electrical Engng., Tech. Univ. of Advanced Transport & Communication Engng., Zilina, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.359-63 (1983).
The incident laser beam is focused on a small diffraction limited spot on the surface acoustic wave propagating surface where it is reflected. The reflected light contains information about local properties of the SAW at the point of the light reflection. A phase sensitive detection of the laser beam is used to get information about the SAW from the reflected light. (2 refs.)

119111 Stress dependence of magnetically induced ultrasonic shear wave velocity change in polycrystalline A-36 steel. H.Kwun, C.M.Teller (Instrumentation Res. Div., Southwest Res. Inst., San Antonio, TX, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4856-63 (Sept. 1983).
Magnetically induced changes in the velocity of 4.5-MHz ultrasonic shear waves were investigated in polycrystalline A-36 steel as a function of both uniaxial tensile and compressive stresses. The velocity changes induced by the applied magnetic field exhibit distinctly different stress effects depending on the relative orientations between the shear wave polarization, the magnetic field, and the external stress axis as well as on the magnitude and sign, i.e. tensile or compressive, of the stress. The magnetically induced velocity changes and their stress dependence were found to be insensitive to the elastic anisotropy associated with the preferred orientation (rolling texture). Based on the magnetoelastic coupling in the material, a phenomenological account for the distinctly different stress effects on the magnetically induced velocity changes is given. Good semiquantitative agreement was found between the observed characteristic stress dependence of the magnetically induced velocity changes and the phenomenological explanation presented. The characteristic stress dependence of the magnetically induced velocity change together with its lack of sensitivity to the elastic anisotropy of the material offers a new means of nondestructively determining the magnitude, the direction, as well as the sign of an unknown stress in ferromagnetic materials. (29 refs.)

119112 Determination of changes in the sound velocity in shock loaded Ti-6Al-4V with in-material manganin gauges. Z.Rosenberg, Y.Meybar (ADA, Haifa, Israel).
J. Phys. D (GB), vol.16, no.10, p.L193-4 (14 Oct. 1983).
The authors present measurements of the variation of the longitudinal sound velocity with pressure in shock loaded Ti-6Al-4V specimens. The experimental technique is based on monitoring the stress-time history inside the target with thin manganin stress transducers. The resulting values can be represented by the following linear relation between the sound velocity C_L (mm μs^{-1}) and shock stress σ (kbar): $C_L = 6.13 + 0.0049\ \sigma$. This relation is in good agreement with published hydrostatic data for alpha titanium in the 0-9 kbar range. (5 refs.)

119113 Direct electromagnetic generation of ultrasound in potassium. G.V.Puskorius, J.Trivisonno (Phys. Dept., John Carroll Univ., Cleveland, OH, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3566-8 (15 Sept. 1983).
The direct electromagnetic generation of ultrasound has been studied in high-purity, single-crystal potassium. Electromagnetic acoustic transducers were used for both the generation and the detection of ultrasound, and a coherent phase-sensitive detection technique was used to measure the generated signals. The slow shear mode corresponding to the elastic constant C' was studied. The observed zero-field generation amplitude is three times greater than that predicted by the free-electron model which assumes specular scattering of electrons at the metal surface. A nonmonotonic variation of the generation amplitude for magnetic fields below the absorption edge has also been observed. The experimental results are compared with previous measurements and with a recent extension of the free-electron theory which assumes diffuse scattering of electrons at the metal surface. (11 refs.)

119114 On interaction of thermo-acoustic waves with the process of phase transition: a continuous approach. I. Constitutive equations and propagation velocities. K.Tanaka (Univ. of Osaka Prefecture, Osaka, Japan), Y.Tanigawa.
Rev Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.277-88 (May-June 1983). [received: Sept. 1983]
The thermomechanical behavior of thermoplastic materials in the process of solid-solid waves travelling in the material is the special concern of the authors. The constitutive equations for the stress and the entropy density are derived in rate-form, and the propagation condition of the thermo-acoustic waves is obtained. The interaction of the propagation velocity of waves with the progress of phase transition is studied. (20 refs.)

119115 The 'tilt' effect in the absorption of ultra-sound by metals in a low magnetic field. A.V.Golik, E.A.Zarudnyi, A.P.Korokyuk, V.L.Falko, V.I.Khizhyni (Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Solid State Commun. (USA), vol.48, no.4, p.373-5 (Oct. 1983).
The 'tilt' effect in the electron-phonon interaction has been discovered experimentally in metals placed in a low magnetic field, such that the cyclotron radius of conduction electrons is larger than the sound wavelength. (5 refs.)

119116 Nonlinear optoacoustic interaction in photoconducting piezoelectrics. P.A.Pyatakov.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.384-6 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.675-7 (March 1983). [received: Oct. 1983]
A study is made of the excitation of an acoustic wave in a piezoelectric semiconductor due to the interaction of two optical waves of the same frequency forming an interference grating of carriers in a photoconductor and due to the interaction of two acoustic waves which are coupled mutually and to the carrier grating by the density nonlinearity mechanism. Estimates indicate that the amplitude of the excited acoustic wave can be quite large for moderate intensities of the incident wave. (9 refs.)

62.80 ULTRASONIC RELAXATION

(see also 74.30G Ultrasonic attenuation in superconductors, 43.35 Ultrasonics)

119117 Investigation of relaxation processes in the p-n junction region in the ultrasonic wave field. E.Garshka, K.Sakalauskas (Phys. Dept., Vilnius State Univ., Vilnius, USSR).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.377-9 (1983).
Acoustic wave interacting with a space charge of the p-n junction changes some of its parameters. These changes find application in the technique of developing instruments based on the interaction between the acoustic wave and the p-n junction. The physical model of such interaction requires a series of investigations. Some information can be obtained from the immediate measurements of the effective lifetime τ and the stored charge value Q in the region of the injection junction on the exposure of junction to the high-frequency ultrasonic wave. The authors list the results of measurements of the parameters τ and Q in the region of the Se and Si p-n junction as acoustic waves are being propagated via them. The results of the measurements point to the possibility of acoustic modulation of the space charge in the junction region. Relations of τ and Q to the injection charge value and the intensity of the acoustic field have been obtained. (1 ref.)

63.00 LATTICE DYNAMICS AND CRYSTAL STATISTICS

(see also 05.50 Lattice theory, 65. Thermal properties, 66.70 Thermal conduction, 68.30 Dynamics of surface and interface vibrations, 78.30 Infrared and Raman spectra)

63.10 GENERAL THEORY

119118 Dynamics of the Toda lattice: a soliton-phonon phase-shift analysis. N.Theodorakopoulos, F.G.Mertens (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Phys. Rev. B (USA), vol.28, no.6, p.3512-19 (15 Sept. 1983).
The dynamics of the Toda lattice can be described in terms of solitons and nonlinear phonons (ripples). The latter are shown to be obtainable from a general multisoliton solution by allowing the soliton parameters to become imaginary. This device yields phonon phase shifts due to a soliton via a linearization procedure and shows that the zone-edge phonon (standing wave) is removed in the presence of a soliton. An expansion of the soliton-ripple solution up to the second order in the phonon amplitude allows the calculation of typical nonlinear quantities such as momentum and mass of the ripple and the spatial shift of a soliton due to its collision with a ripple. Finally, the relationship is established between the form of a ripple, viewed as a phonon wave packet, and its associated action variable within the framework of inverse scattering theory. (10 refs.)

63.20 PHONONS AND VIBRATIONS IN CRYSTAL LATTICES

119119 Phonons, phonon focusing, and helicon-phonon interaction. K.S.Viswanathan (Dept. of Phys., Kerala Univ., Trivandrum, India).
Curr. Sci. (India), vol.52, no.15, p.695-703 (5 Aug. 1983).
The author discusses phonons, elastic waves in crystals, internal conical refraction of acoustic waves, Faraday rotation of acoustic shear modes, helicons and helicon-phonon interactions, phonon focusing in crystals, second sound, solitons and ballistic pulses. (33 refs.)

119120 Lattice-dynamical evaluation of temperature factors in non-rigid molecular crystals: a first application to aromatic hydrocarbons. C.M.Gramaccioli (Istituto di Mineralogia, Univ. di Milano, Milano, Italy), G.Filippini.
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.784-91 (1 Sept. 1983).
Evaluation of temperature factors from a harmonic lattice-dynamical theory of molecular crystals has been applied to some aromatic hydrocarbons in the non-rigid case: i.e. mixing of lattice vibrations with the lowest-frequency internal modes. The calculations start from known atomic coordinates, unit-cell parameters and symmetry operations, using Califano-Neto potentials for inplane modes, Williams IVa potentials for intermolecular interactions, and an overall value of 0.9 nN Å for any twisting around C-C bonds. Molecular motions inside the crystal are described on the basis of normal coordinates of the isolated molecule, by applying Gwinn's method. (41 refs.)

119121 Instability of polaritons driven by infrared laser light. Ke-Hsuch Li (Inst. of Phys., Chinese Acad. of Sci., Beijing, China).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.297-300 (12 Sept. 1983).
The nonlinear behavior of lattice vibrations driven by a coherent electromagnetic wave on the basis of Huang's equations is discussed. Under certain conditions formulated in the text these mixed electromagnetic lattice waves (polaritons) become unstable for some regions of the parameters of the incident laser light. Unstable motion of crystal lattices may be considered as a damage mechanism of the crystal structure. (9 refs.)

119122 Effect of electric field on the lattice viscosity of doped displacive ferroelectrics. R.P.Gairola, M.K.Gupta (Dept. of Phys., Univ. of Garhwal, Garhwal, India).
Phys. Rev. B (USA), vol.28, no.5, p.2775-84 (1 Sept. 1983).
A general expression for the lattice viscosity in doped displacive ferroelectrics, in the presence of an external electric field, is obtained using the double-time thermal Green's-function technique. The mass and force-constant changes between the impurity and host-lattice atoms are taken into account in the Silverman Hamiltonian augmented with higher-order anharmonic and electric moment terms. The defect-dependent, electric-field-dependent and anharmonic contributions to the lattice viscosity are discussed separately. It is shown that the lattice viscosity tensor, which is the sum of two terms arising from acoustic and optical phonons, can be further separated into diagonal and nondiagonal parts. The nondiagonal contribution vanishes in the absence of defects. The frequency and temperature dependences of the viscosity tensor are also discussed. (20 refs.)

119123 Renormalization of the *H*-point phonon anomaly in molybdenum. C.-L.Fu, K.-M.Ho, B.N.Harmon (Ames Lab., USDOE, Ames, IA, USA), S.H.Liu.
Phys. Rev. B (USA), vol.28, no.6, p.2957-61 (15 Sept. 1983).
The frequency of the *H*-point phonon of molybdenum obtained from precise frozen-phonon calculations differs from the experimental value by 9%. An analysis of this unusually large discrepancy shows that nonadiabatic effects are small, while effects caused by the many-body renormalization of electronic states near the Fermi energy are of the same order of magnitude as the discrepancy. (19 refs.)

119124 Lattice dynamics of incipient ferroelectric rutile TiO_2. F.Gervais (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany), W.Kress.
Phys. Rev. B (USA), vol.28, no.6, p.2962-8 (15 Sept. 1983).
Phonon dispersion curves in rutile TiO_2 have been calculated with a rigid-ion model and a shell model. The shell model closely reproduces experimental data. The hardening of soft ferroelectric Γ_1^- and Γ_5^+ TO modes with increasing temperature, which is observed experimentally, is found to be due to a small simultaneous decrease in effective ionic charge and oxygen polarizability. The decrease in both quantities can be understood in terms of fourth-order inter-ion and oxygen core-shell anharmonic interactions. (21 refs.)

119125 Lattice dynamics of thin ionic slabs. I. The electrostatic energy. G.Kanellis, J.F.Morhange, M.Balkanski (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Phys. Rev. B (USA), vol.28, no.6, p.3390-7 (15 Sept. 1983).
The electrostatic energy per cell for thin slabs of ionic crystals is calculated as a function of the thickness of the slab, its orientation and the position of the cell with respect to the surfaces. The summation method used is simple and quite general to allow for direct application to slabs of any structure. The depolarization field associated with slabs of certain orientations is also calculated and discussed. Numerical results are given for slabs of the zinc-blende and rocksalt structures. (4 refs.)

119126 Lattice dynamics of thin ionic slabs. II. The long-range forces. G.Kanellis, J.F.Morhange, M.Balkanski (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Phys. Rev. B (USA), vol.28, no.6, p.3398-3405 (15 Sept. 1983).
For pt.I see ibid., vol.28, p.3390 (1983). The Coulomb interaction is calculated for thin ionic slabs of any structure and orientation. For ions lying on different planes, parallel to the plane of the slab, the direct-space double sum is transformed into a rapidly converging double sum in reciprocal space only, while for ions lying on the same plane, a two-dimensional version of Ewald's method is used. Finally the authors comment on the macroscopic field associated with long-wavelength vibrations of an infinite lattice on the basis of a two-dimensional summation method. (6 refs.)

119127 Lattice dynamics of thin ionic slabs. III. Application to GaAs slabs. G.Kanellis, J.F.Morhange, M.Balkanski (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Phys. Rev. B (USA), vol.28, no.6, p.3406-14 (15 Sept. 1983).
For pt.II see ibid., vol.28, p.3398 (1983). The lattice vibrations of thin slabs (up to 25 layers) of GaAs are calculated for zero wave vector, on the basis of a rigid-ion model fitted on the phonon dispersion curves of the infinite crystal. It is shown that all the modes, except the surface ones, fall on the branches of the dispersion curves of the infinite crystal, while the surface modes seem to be combinations of those missing near the one-edge modes. Comparison is made with former calculations and the influence of the short-range interaction near the surfaces and that of possible macroscopic fields is discussed. (18 refs.)

63.20D Phonon states and bands, normal modes, and phonon dispersion

119128 Lattice vibrations in rare gas crystals. D.Singh, R.P.S.Rathore (Dept. of Phys., RBS Coll., Agra, India).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.263-8 (Sept. 1983).
The lattice dynamical model due to Massa et. al. (1979) is augmented for the inclusion of (a) the long range Van der Waal's interaction and (b) three body overlap terms. The elastic behaviour and the dispersion relations for the four rare gas crystals, i.e. neon, argon, krypton and xenon are predicted by modified versions and are compared with (a) the experimental findings and (b) the results of Massa et al. It is found that the model due to Massa et al. when supplemented with the Van der Waal's and three body terms proves to be more reliable and effective. (14 refs.)

119129 Inelastic scattering of slow neutrons in tin. M.Zivanovic, V.Spasojevic (Boris Kidric Inst. of Nuclear Sci., Belgrade, Yugoslavia).
Fizika (Yugoslavia), vol.15, no.3, p.233-7 (July-Sept. 1983).
The time-of-flight spectra of inelastically scattered cold neutrons on tin were investigated at 163, 225, 293, 468, 523 and 543K. A typical temperature dependence of the phonon population has been found, as well as the spreading of the phonon peaks in the liquid phase. The phonon spectrum of tin shows typical features of metal spectra. (5 refs.)

119130 On the effect of the correlation in phonon motion on the viscosity of impure dielectrics. A.G.Kozorezov (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.399-403 (26 Sept. 1983).
The effect of the correlation in phonon motion on the viscosity of impure dielectrics is studied. It is shown that for perfect dielectrics the relaxation times entering the expressions for the absorption of longitudinal and transverse acoustic waves are different due to phonon correlations. The influence of impurities on the viscosity of dielectrics is discussed. Special emphasis is given to the problem of longitudinal-acoustic-wave absorption in impure dielectrics. It is shown that the effect of impurities on phonon correlations can lead to a substantial change in absorption of longitudinal waves. (25 refs.)

119131 Neutron spectroscopy of phonons in stage-1 rubidium-intercalated graphite. W.A.Kamitakahara (Kernforschungzentrum Karlsruhe, Inst. fur Angewandte Kernphys. I, Karlsruhe, Germany), N.Wada, S.A.Solin, L.M.Seaverson.
Phys. Rev. B (USA), vol.28, no.6, p.3457-64 (15 Sept. 1983).
Neutron scattering measurements have been carried out on the graphite intercalation compound RbC_8. Phonon dispersion curves were measured for *c*-axis longitudinal modes and for some transverse branches with wave vectors in the basal plane and polarization out of plane. For the latter, there is a strong deviation of the dispersion relation from that of pure graphite. In addition, a partial phonon density of states was determined for intercalate (Rb) vibrations by in-basal-plane inelastic scattering. The authors analysis shows that a two-dimensional (2D) Born-von Karman model with nearest-neighbor Rb-Rb force constants cannot account for the intercalate mode spectrum. A three-dimensional model in which the Rb-Rb forces are due to an unscreened Coulomb interaction agrees well with the data, implying that conduction-electron screening of the Rb-ion motions is substantially reduced in RbC_8 relative to Rb metal. (34 refs.)

119132 Unified study of the lattice-mechanical properties of copper halide crystals. S.Chatterjee (Phys. Dept., Presidency Coll., Calcutta, India), S.Ghosh, A.N.Basu.
Phys. Rev. B (USA), vol.28, no.6, p.3534-49 (15 Sept. 1983).
The copper halide crystals, namely CuI, CuBr, and CuCl, though they have predominantly ionic binding, possess zinc-blende structure, and crystals having this structure have, in general, rather significantly low ionicity. This peculiarity is attendant with a number of unusual properties of this group of solids, and the various attempts to understand them in terms of the existing models show certain problems. Recently the authors have developed a general energy expression for an assembly of ions occupying an arbitrary configuration from a microscopic analysis of the problem. Inspection of the energy expression shows that within the S^2 approximation (up to and including second-order exchange) the following distortions are allowed: the two types of short-range dipolar deformations apart from the long-range dipolar one, scalar, and quadrupolar deformations. A model based on this energy expression has been employed to make a unified study of the different lattice-mechanical properties of the three copper halides. The specific properties that the authors have tried to correlate are the cohesive energy, the elastic and the dielectric properties, and the dispersion of phonons with the same set of parameters for each crystal.. Finally, the results for the different crystals and the possible sources of the remaining discrepancies are discussed. (36 refs.)

119133 Lattice vibrations in potassium based on an electron-gas-Morse potential. K.Mohammed, M.M.Shukla, F.Milstein, J.L.Merz (Univ. of California, Santa Barbara, CA, USA).
Solid State Commun. (USA), vol.48, no.2, p.147-50 (Oct. 1983).
Phonon dispersion relations and the Debye temperature of potassium are studied. The model employed in the study uses Morse potential for ion-ion interaction. In order to take into account the effect of conduction electrons, the authors have also included an electron-ion interaction term. By using this novel scheme, they were able to compute phonon frequencies which gave extremely satisfactory agreement with the observed data. (21 refs.)

119134 Analytical solution of the inverse spectrum problem for the A_3B lattice dynamics model. A.F.Maksimov.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.541-3 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.939-41 (March 1983). [received: Oct. 1983]
A method is described for the calculation of parameters in the A_3B composite lattice dynamics model from the experimental dispersion curves by means of an extended system of compatibility equations. This approach yields explicit theoretical expressions to solve the inverse problem. (5 refs.)

63.20K Phonon-electron interactions

119135 Anisotropy of the piezoelectric electron-phonon interaction in wurzite semiconductors. D.Dunn (J.J. Thomson Phys. Lab., Univ. of Reading, Reading, England).
J. Phys. C (GB), vol.16, no.28, p.5427-33 (10 Oct. 1983).
Explicit (and exact) expressions are derived for the electron-phonon interaction parameters describing the interaction of conduction electrons and long-wavelength piezoelectric phonon modes in wurzite semiconductors. The effect of the anisotropy of the interaction is demonstrated by calculating the electron self-energy and spectral density. Both functions show a strong angular dependence in contrast to the predictions of the 'isotropic model' of piezoelectric scattering. (12 refs.)

119136 Electron-phonon coupling in KCP. I.Baldea, M.Apostol (Dept. of Theoretical Phys., Central Inst. of Phys., Bucharest-Magurele, Rumania).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1557-60 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A model is proposed for the electron-phonon coupling in the 1d distorted lattice which accounts for the data in KCP. (6 refs.)

119137 Cooperation of free- and bound-electron-phonon scattering in Sb-doped Ge. S.R.Singh, S.Singh (Dept. of Phys., Udai Pratap Post-Graduate Coll., Uttar Pradesh, India).
Phys. Rev. B (USA), vol.28, no.6, p.3386-9 (15 Sept. 1983).
The cooperation of free- and bound-electron-phonon scatterings are studied in detail for Sb-doped Ge in the intermediate range of donor concentrations. It has been shown that the cooperation of free- and bound-electron-phonon scatterings in the intermediate range of donor concentrations explains the anomalous variation of the phonon-conductivity ratio $\mathcal{K}_D/\mathcal{K}_P$ (doped to pure host) with temperature for Sb-doped germanium which could not be explained so far by previous workers. 119138 Influence of random strain fields on the frequency distribution of degenerate local vibrations. M.A.Ivanov, A.Ya.Fishman (Inst. of Metall., Acad. of Sci., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.546-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.946-8 (March 1983). [received: Oct. 1983]
Strain fields due to the presence of point defects in a crystal cause a considerable broadening of the local vibration frequencies. The authors deal with the distribution functions for doubly and triply degenerate local vibrations, for which the resultant frequency distribution is due to the lifting of the degeneracy by many-component random strain fields. 63.50 VIBRATIONAL STATES IN DISORDERED SYSTEMS

119139 Nonlinearity parameter and its relationship with thermo-acoustic parameters of polymers. B.K.Sharma (Phys. Dept., Regional Coll. of Education, Bhubaneswar, India).
J. Phys. D (GB), vol.16, no.10, p.1959-65 (14 Oct. 1983).
A relationship between the isobaric, isothermal and isochoric lattice Gruneisen parameters has been examined and analysed for several polymers. Relationships between the various parameters describing the thermo-acoustic and nonlinear properties of polymers are developed and their relations with thermo-acoustic data established. It is shown that the isochoric temperature derivative of the sound speed or bulk modulus is the dominant factor, with a significant contribution to the thermo-acoustic properties. Using this simple model, Beyer's parameter of nonlinearity, thermo-acoustic parameters, molecular constant, Huggins parameter and the lattice Gruneisen parameters are shown to be related to each other. Calculated data on these parameters for eight polymers are presented. The results have been used to develop further understanding of the significance of microscopic factors such as molecular order and intermolecular interactions, upon macroscopic thermo-acoustic properties in polymers. A new dimensionless thermo-acoustic parameter S_0^* expressed in terms of volume expansivity only has been introduced, which gives, on an average, a constant value of 1.06 in polymers. (20 refs.)

119140 Dynamics and vibrational spectroscopy of doped polyacetylene as one dimensional disordered crystal. G.Zerbi, G.Zannoni (Politecnico di Milano, Milano, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.273-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The vibrational spectra of doped and undoped trans-polyacetylene are analyzed with the help also of model molecules such as β-carotene. Results from lattice dynamical calculations are reported. The spectroscopic points which are still controversial are presented. (20 refs.)

119141 Density of vibrational states of chemically and structurally disordered polyacetylene. G.Zannoni, G.Zerbi (Dipartimento di Chimica Industriale e Ingegneria Chimica, Politecnico di Milano, Milano, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.503-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Normal mode calculations on two possible kinds of chemical disorder in trans-PA are presented. These chemical defects show characteristic localized modes, which seem to find corresponding bands in the vibrational spectra. Comparison with the literature data indicates that the vibrational assignment of trans-PA is still quite uncertain. (7 refs.)

119142 Peierls instability and vibrational spectra of polyacetylene. A.A.Ovchinnikov (Karpov Inst. of Phys. Chem., Moscow, USSR), A.Belinskii, I.A.Misurkin, I.I.Ukrainskii.
J. Phys. Colloq. (France), vol.44, no.C-3, p.511 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Summary form only given, as follows. It is shown that the Peierls instability in conjugated polymers is modified by the interaction of π-electrons. This modification gives rise to the absence of a soft mode of stretching C-C vibrations. Taking into account electron correlations the authors obtain a reasonable agreement between the calculated and measured frequencies of carbon skeleton of polyacetylene with all the C-C bonds being equal in length. In is shown that the conclusion of the bond length alternation in polyacetylene does not follow from the experimental data on the vibrations of polyacetylene. (2 refs.)

(see also 65. Thermal properties of condensed matter, 66.70 Thermal conduction)

119143 Frequency spectrum, specific heat and Debye temperature of α-iron. O.P.Gupta (Phys. Dept., J. Christian Coll., Allahabad, India).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.269-76 (Sept. 1983).
The frequency spectrum, specific heat and Debye temperature of α-iron have been calculated on the basis of recent lattice dynamical model. The computed values are compared with the available experimental data. The theoretical results are in reasonable agreement with the experimental values. (59 refs.)

119144 Excess Gruneisen parameter and intermolecular interaction in binary liquid mixtures of trichloroethylene. B.P.Shukla, V.N.Mishra, S.N.Dubey (Dept. of Chem., Nat. Degree Coll., Gorakhpur, India).
Curr. Sci. (India), vol.52, no.15, p.721-3 (5 Aug. 1983).
The Gruneisen parameter (Γ), which is a dimensionless measure of change in entropy with volume or thermal pressure, has been extended to liquid state for investigating the internal structure, clustering phenomena and remaining

quasicrystalline lattice nature. By using some thermodynamic relations, Γ can be expressed by the relation: $\Gamma=C^2\ \alpha/C_p=\gamma-1/T\alpha$, where C, α, C_p and γ represent sound velocity, thermal expansion coefficient, principal heat capacity at constant pressure and heat capacity ratio respectively. The sum of exponents of Mies' equation has been determined for liquid mercury, using Gruneisen number, assuming a condensed system of molecules and consisting of harmonic oscillators. The Gruneisen parameter has been extended to binary liquid mixtures and the value of excess Gruneisen parameter has been calculated using the relation $\Gamma^E=\Gamma_{mix}-\Sigma_{i=0}{}^2 x_i\Gamma_i$. (12 refs.)

119145 X-ray investigation of the mean square thermal displacements in VD_x, NbH_x and TaH_x interstitial alloys. H.Behr, H.M.Keppler, G.Steyrer, H.Metzger, J.Peisl (Sektion Phys., Ludwig-Maximilians Univ. Munchen, Munchen, Germany).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.985-9 (1983).
X-ray measurements of the integrated Bragg intensities from V, Nb and Ta single crystals as a function of hydrogen (D) concentration and temperature have been carried out. Two different methods were applied: (i) the usual angular dispersive method using $MoK_{\alpha 1}$ characteristic radiation; and (ii) the energy dispersive method using the white spectrum of the Mo tube and an intrinsic Ge detector. From the results the thermal Debye-Waller factor for the three metals and its change with hydrogen concentration are determined. The mean square of the thermal displacements $\langle u^2\rangle$ decreases with hydrogen (D) concentration. For $NbH_x(D_x)$ this agrees well with $\langle u^2\rangle$ values as determined from measured phonon density of states spectra. The results are also given in terms of a Debye temperature depending on H(D) concentration. (16 refs.)

63.90 OTHER TOPICS IN LATTICE DYNAMICS AND CRYSTAL STATISTICS

119146 Soft modes of crystals belonging to the SbSI-SbSBr system. V.Kalesinskas, I.Grigas, V.Paprotnyi, V.Spitsyna (State Pedogogical Inst., Vilnius, Lithuanian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.421-6 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.738-45 (March 1983). [received: Oct. 1983]
The dielectric spectra $\epsilon'(\nu,T)$ and $\epsilon''(\nu,T)$ of SbSI-SbSBr crystals were investigated in the frequency range from 8 to 80 GHz. A resonance of the dielectric dispersion was observed in the paraelectric phase and this attributed to a soft overdamped mode of frequency in the microwave range. The dispersion parameters of soft modes were determined for crystals of this system and their temperature dependences were found. The microwave soft mode dominated the static permittivity and was responsible for its variation in accordance with the Curie-Weiss law. It was found that this microwave soft mode was additional to the familiar phonon modes and that phase transitions in these crystals were intermediate between displacive and order-disorder transitions. (33 refs.)

64.00 EQUATIONS OF STATE, PHASE EQUILIBRIA, AND PHASE TRANSITIONS

(see also 82.60 Chemical thermodynamics)

64.10 GENERAL THEORY OF EQUATIONS OF STATE AND PHASE EQUILIBRIA

119147 Calculation and representation of phase equilibria in multicomponent systems. E.-Th.Henig, U.Kattner, G.Petzow (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.769-76 (Sept. 1983).
The general features of thermodynamic calculation of phase equilibria are reviewed. This includes analytical description of the thermodynamic functions by approximations or models, determination of the resulting adjustable coefficients from experimental data, calculation of phase equilibria based on the Gibbs free energy functions of individual phases and graphical representation of the results. Special emphasis is given to different types of two-dimensional representations only containing partial information about the multidimensional higher order systems. (35 refs.)

119148 Application of thermodynamic models in phase diagram assessment. M.Hillert (Div. of Phys. Metall., Royal Inst. of Technol., Stockholm, Sweden).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.762-9 (Sept. 1983).
By the use of examples which mainly concern the configurational entropy of alloy systems at attempt is made to illustrate the application of physical and mathematical models to the assessment of alloy systems. It is emphasized that methods, which are often regarded as independent of models, depend very strongly on some hidden choice of a model. Different physical models can give the same mathematical model. For further developments it may be essential to test what physical model gives the most realistic description of the situation in the real system. Different mathematical models can represent the data very well even when the properties of the system are very specific. (25 refs.)

119149 Theory of nucleation on charged cores. II. Thermodynamic parameters of an equilibrium nucleus. F.M.Kuni, A.K.Shchekin, A.I.Rusanov (Leningrad Univ., Leningrad, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.935-41 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1062-8 (Nov.-Dec. 1982). [received: Sept. 1983]
For pt.I see ibid., vol.44, no.5 (1982). The dependence of the surface tension, the radius of the tension surface, the radius of the equimolecular surface, the absolute specific adsorption, the specific surface entropy, the surface polarization, the excess large thermodynamic potential, and the work for the formation of a nucleus on the magnitude and sign of its charge has been determined for a critical nucleus with an electric charge at its center. (4 refs.)

119150 Gravity-induced density and concentration profiles in binary mixtures near gas-liquid critical lines. R.F.Chang, J.M.H.Levelt Sengers (Thermophys. Div., NBS, Washington, DC, USA), T.Doiron, J.Jones.
J. Chem. Phys. (USA), vol.79, no.6, p.3058-66 (15 Sept. 1983).
The authors have calculated gravity-induced density and concentration gradients using scaled equations of state fashioned after that of Leung and Griffiths for binary mixtures near gas-liquid critical lines. The mixtures considered here are those of helium-3 and helium-4 and of carbon dioxide and ethane. The calculations show that the density profiles for both mixtures in any proportion of the components are similar to those of pure fluids. The concentration gradients in the helium mixture have the same appearance as the density gradients. In the carbon dioxide-ethane system, however, the form of the concentration profile varies greatly, depending on the overall composition. Moreover, the temperature at which a mixture separates into two phases is slightly different from that expected for the mixture in the absence of gravity. The authors have also examined the case where a mixture is subjected to a large gravitational field such as can be generated in a centrifuge and found that, although the density gradient in all the mixtures is like that in pure fluids, the concentration gradients in the mixtures of carbon dioxide and ethane have complex features related to the presence of critical azeotropy. (33 refs.)

119151 Quantum and thermal nucleation in polydiacetylene. S.Kivelson, J.P.Sethna (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.657-65 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A simple continuum model of polydiacetylene (PD) is constructed and used to study the structural-phase-transition that occurs in certain PDs. It is concluded that the transition in ETCD-PD is thermally-nucleated while that in TCDU-PD is probably quantum-nucleated. (13 refs.)

119152 Incommensurate structure as a nonlinear resonance between an atomic chain and a field. P.I.Belobrov, A.G.Tret'yakov, G.M.Zaslavsky (Kirensky Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.409-12 (26 Sept. 1983).
The general condition for the commensurate-incommensurate phase transition in an atomic chain is considered. The potential energy of atoms consists of a next-neighbour interaction and an external periodic field. This condition reveals itself in the so-called nonlinear resonance for an equivalent dynamical system. (12 refs.)

119153 Monte Carlo studies of a Laplacian roughening model for two-dimensional melting. K.J.Strandburg, S.A.Solla, G.V.Chester (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2717-31 (1 Sept. 1983).
Monte Carlo simulations are used to study the thermodynamic properties of the Laplacian roughening model. Nelson has shown that this model is related via a duality transformation to a gas of disclinations in a two-dimensional solid, and mimics the positional and orientational symmetries relevant to two-dimensional melting. In the authors' simulations thermodynamic functions vary continuously over the full temperature range and agree with analytic results at low and high temperatures. Correlation functions exhibit three distinct regimes as a function of temperature and yield strong evidence for the existence of an intermediate phase characterized by short-range positional order and quasi-long-range orientational order. The Monte Carlo results are in quantitative agreement with the predictions of the Kosterlitz-Thouless-Halperin-Nelson-Young theory and establish the existence of two successive continuous phase transitions for the Laplacian roughening model. The corresponding transition temperatures are obtained from the temperature dependence of the renormalized elastic constant K_R and the Frank constant K_A. (21 refs.)

119154 Doubled-incommensurate phase transition in quasione-dimensional systems. A.I.Buzdin, V.V.Tugushev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.506-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.882-4 (March 1983). [received: Oct. 1983]
The authors study the phase diagram of the insulating state of a quasione-dimensional system with a nearly half-filled band $|c\text{-}1| \ll 1$ (c is the number of electrons per unit cell in the metallic phase). Umklapp scattering is then important. If $n < n_c$ [the density is given by $n = |c\text{-}1|/a$, where $n_c = 1.208\Delta_0 N(0)$; a is the lattice constant; Δ_0 is the gap in the spectrum of the doubled phase at $T=0$; and $N(0)$ is the density of states], a transition to a state with a doubled period $q = \pi/a$ takes place rather than to a state with a static strain $q = 2k_F$. 64.70 PHASE EQUILIBRIA, PHASE TRANSITIONS, AND CRITICAL POINTS

(see also 81.30 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations)

119155 Phase transitions of binary mixtures in random media. F.Brochard, P.G.de Gennes (Coll. de France, Paris, France).
J. Phys. Lett. (France), vol.44, no.18, p.L785-91 (15 Sept. 1983).
The authors consider a porous solid, or a gel, saturated by a two fluid system A+B, in the limit where the thickness ξ of the AB interface is smaller than the pore size D. The solid prefers to be in contact with one of the fluids (A). But, if the chemical potential of B is decreased, the B fluid enters the structure. They discussed the reversible penetration process, and find two distinct modes: 'capillary invasion' with clusters of B regions growing progressively; 'flip process' where all pores are abruptly invaded by B (except possibly for a thin sheath of thickness ξ near the walls). The 'fields' H (=chemical potential changes) required to perform capillary invasion (H_c) or flip (H_f) are in ratio: $H_f/H_c \simeq (\xi/D)\exp(2-d_f)$ where d_f is the fractal dimension of the pore surface. Gels made with rod-like molecules have $d_f=1$, while flexible chains in good solvents have $d_f=5/3$. For all gels the flip process should dominate, and they expect a sharp transition. On the other hand, porous solids ($d_f=2$) require a special discussion. Modeling the pores as interconnected capillaries of random diameter D, they find that capillary invasion dominates in this case, and they expect no sharp transition. (18 refs.)

119156 The silver iodide-thallium iodide pseudo-binary system. J.W.Brightwell, L.S.Miller, A.Munday, B.Ray (Faculty of Appl. Sci., Coventry Polytech., Coventry, England).
Phys. Status Solidi a (Germany), vol.79, no.1, p.293-300 (Sept. 1983).
A form of the T-x section of the equilibrium phase diagram for the system AgI-TlI is proposed on the basis of thermal and X-ray diffraction data. Two room temperature stable intermediate phases $AgTlI_2$ and $AgTl_2I_2$ are confirmed, and evidence is found for two other phases, stable at higher temperatures. The electrical conductivity is determined principally by the fraction of AgI present; fast ion conduction occurred only when α-AgI was present. (16 refs.)

119157 Closed-loop phase diagrams, vaporization, and multicriticality in binary liquid mixtures. R.G.Caflisch (Dept. of Phys., MIT, Cambridge, MA, USA), J.S.Walker.
Phys. Rev. B (USA), vol.28, no.5, p.2535-46 (1 Sept. 1983).
The coupled Potts-Ising models of Walker and Vause, which successfully describe closed-loop phase diagrams in hydrogen-bonding mixtures, are generalized to encompass the vapor phase and are studied using positron-space renormalization-group techniques. Global phase diagrams are generated, exhibiting such features as miscibility-immiscibility criticality, liquid-vapor critical points, critical end points and bicritical and tricritical points. In addition, new types of phase diagrams are found, involving upper and lower azetotropes, for example, which are expected to be physically realizable in experimental systems. (38 refs.)

119158 Phase diagrams of surface structures from Bethe-ansatz solutions of the quantum sine-Gordon model. F.D.M.Haldane (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen, Denmark), P.Bak, T.Bohr.
Phys. Rev. B (USA), vol.28, no.5, p.2743-5 (1 Sept. 1983).
Phase diagrams of uniaxial two-dimensional systems with commensurate, incommensurate, and liquid phases are derived by combining exact results for the quantum sine-Gordon model with the Kosterlitz-Thouless theory of melting. The phase diagram depends on the order of commensurability, p. In particular, for $p=3$ (the 'chiral Potts' case), the authors conjecture that the phase diagram contains no Lifshitz point, in contrast to previous authors; for $p=1$, dislocations remove the original *CI* transition completely. (18 refs.)

119159 Study of the phase diagrams of graphite intercalation compounds. S.E.Millman, G.Kirczenow (Dept. of Phys., Boston Univ., Boston, MA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3482-3500 (15 Sept. 1983).
The model of staging recently proposed by Millman and Kirczenow (1982) is used to survey the possible phase diagrams for graphite intercalation compounds. For a wide variety of intercalants, including the alkali metals and aromatic molecules, the model predicts the staged structures which are observed experimentally. The model also provides physical guidelines for identifying materials in which more complex structures, such as those predicted recently by Safran (1980), may be realized at high temperatures. The authors suggest a class of compounds, the transition-metal chloride, which may possibly meet these physical guidelines. If this complex staging is found, the model predicts rich and varied phase diagrams which are very sensitive to changes in the physical parameters. The authors also discuss some possible improvements to the model and show that the essential predictions of the model are not affected by these improvements. (12 refs.)

119160 A study of AgI-CuI-KI-RbI system using DTA and X-ray methods. I.V.Vasil'kova, I.I.Kozhina, M.D.Pyatunin, S.I.Stepanova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.99-101 (Aug. 1983). In Russian.
The AgI-CuI-KI-RbI four component system has been investigated by thermographic and X-ray methods. The phase diagram has been constructed. (5 refs.)

119161 Investigation of the melting point of thin films as a method of determining their elastic energy. G.A.Ukhlinov, E.A.Kolesnik, V.N.Vigdorovich (Moscow Inst. of Electronic Engng., Moscow, USSR).
Ind. Lab. (USA), vol.48, no.12, p.1192-4 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.38-40 (Dec. 1982). [received: Sept. 1983]
Investigation of the melting point of thin films is of scientific-methodological value for the determination of the excess enthalpy (internal energy) of the films. A method is proposed to determine the film melting point in a closed system with an electrical display of the instant of melting by the break in the electrical loop into which the film is connected in series. The specimen is a film of substance on a substrate. It is comprised of a substrate on a base and a cover pressed to its surface through a mica dielectric padding. A depression for insertion of the thermometer is made in the base of a copper block. Commutation of the film with the electrical loop is by molybdenum foil spring contacts fastened by bolts and nuts. (4 refs.)

119162 Preparation and melting point of octalithium zirconate. M.S.Ortman, E.M.Larsen (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.142-4 (Aug. 1983).
Octalithium zirconate was prepared by heating a pelletized stoichiometric mixture of fused lithium oxide and zirconium dioxide under a dynamic vacuum to 863K for 40 h. The melting point was determined to be 1568 ± 5K. Chemical inertness and high lithium atom density, 5.93×10^{22} atoms/cm^3, make octalithium zirconate a candidate for a solid tritium breeder. 64.70F Liquid-vapour transitions

119163 Hydrogen bonding and other polar interactions of 1-,2-, and 4-octyne with organic solvents. J.H.Hallman, W.K.Stephenson, R.Fuchs (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
Can. J. Chem. (Canada), vol.61, no.9, p.2044-7 (Sept. 1983).
The heats of vaporization of 1-octyne (10.11±0.02 kcal/mol), 2-octyne (10.63±0.03 kcal/mol), and 4-octyne (10.21±0.02 kcal/mol) have been determined. Heats of solutions of the liquid octynes and *n*-octane have been measured in heptane, cyclohexane, 1,2-dichloroethane, *n*-butyl ether, ethanol, triethylamine, dimethyl sulfoxide, butyrolactone, dimethyl-heptane, cyclohexane, 1,2-dichloroethane, *n*-butyl ether, ethanol, triethylamine, dimethyl sulfoxide, butyrolactone, dimethylformamide, and hexamethylphosphoric triamide. Enthalpies of transfer from vapor to each solvent have been calculated. Enthalpies of hydrogen bond formation, calculated by the pure base method, become more exothermic in the above solvent order. Correlations with the Taft-Kamlet solvent parameters π^* and β indicate that other polar interactions (presumably dipole-induced dipole) are appreciably larger for 1-octyne than for 2- and 4-octyne. (13 refs.)

119164 Synthesis of optimal and near-optimal distillation sequences by a bounding strategy. L.Pibouleau, A.Said, S.Domenech (Inst. du Genie Chimique, Toulouse, France).
Chem. Eng. J. (Switzerland), vol.27, no.1, p.9-19 (Aug. 1983).
The problem of synthesizing an optimal multicomponent separation flow sheet according to capital and operating expenses is solved by a branch and bound method. The lower bound used in the branch and bound procedure is defined with the help of a heuristic rule. The algorithm can find the optimal sequence and all the sequences whose costs are within a specified factor of the cost of the optimal sequence. The distillation columns are computed using a short-cut method, and the capital and operating expenses are calculated by the Guthrie method. A detailed example shows that the ratio of the number of explored sequences to the total number of possible sequences is always very low (less than 0.25) and that similar operating conditions (operating pressure and reflux ratio) usually give the same optimal sequence. Furthermore, the FORTRAN code of the method can be implemented using less than 32k bytes of central memory, so the program can be used on a microcomputer. (32 refs.)

119165 Experimental study of vapor-liquid relationships for binary system in high vacuum evaporation—DBP-DBS system. Y.Hagihara (Dept. of Chem, Nat. Defense Acad., Yokosuka, Japan).
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.3, p.253-64 (Nov. 1982). In Japanese. [received: Aug. 1983]
Measurements of the vapor-liquid relationships for DBP-DBS system were made in a range or residual air pressure from 1.0×10^{-3} to 3.5×10^{-1} mmHg by using an agitator vessel. Based on the experimental results, the effects of residual air pressure and liquid surface temperature on the vapor-liquid relationship in a high vacuum evaporation are clarified. An empirical formula was also derived which showed approximate agreement with the vapor-liquid relationship for a binary system. (8 refs.)

119166 On concentration dependence of partition coefficients between liquid and gas phases. B.V.Ioffe, V.V.Larionov, A.N.Marinichev.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.63-8 (Aug. 1983). In Russian.
Concentration dependence of partition coefficients between liquid and gas phases is considered in ideal and nonideal multicomponent systems. The expressions obtained may be used for the headspace analysis of industrial products. (4 refs.)

64.70H Solid-vapour transitions

119167 Effect of UV illumination on the sublimation of basal surfaces of zinc oxide. D.A.Carey (US Air Force Acad., Colorado Springs, CO, USA), R.A.Rapp, J.P.Hirth.
J. Chem. Phys. (USA), vol.79, no.6, p.3160-2 (15 Sept. 1983).
In view of questions about the rate controlling mechanism of ZnO sublimation, experiments were undertaken to determine the effect of photoexcitation on the rate of sublimation. If charge recombination were rate controlling, the increased electronic charge carrier density produced by photoexcitation should increase the rate from both basal surfaces, while this need not be so for the other model. (7 refs.)

119168 Evaporation of metals by a high-energy-density source. D.Havazelet, A.Birnboim (Nuclear Res. Center-Negev, Beer Sheva, Israel).
J. Phys. D (GB), vol.16, no.10, p.1917-28 (14 Oct. 1983).
The authors present a theoretical model describing the evaporation and expansion of vapours from metal surfaces subject to high energy density. The model links the surface temperature of the metal with the evaporation rate and the hydrodynamic parameters of the vapour near the surface. These parameters serve as boundary values for the hydrodynamic equations describing the gas flow, which are solved by a 1-D Lagrangian simulation code. A criterion for the transition from hydrodynamic flow to molecular flow far from the metal is presented, with the aid of which they predict the vapour flux and velocity distribution as a function of the surface temperature. Good agreement between their predictions and empirical results is found. (8 refs.)

Phase composition of vacuum condensates in the Y_2O_3-ZrO_2 system ....See Entry 120315

64.70J Liquid-liquid transitions

119169 Existence of a novel liquid phase in methyl acetate. S.Kawanishi (Takasaki Radiation Chem. Res. Establ., JAERI, Takasaki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3093-100 (Sept. 1983).
For methyl acetate with a planar structure C-CO-O in the molecule, a spin-lattice relaxation time (T_1) and a specific volume were measured in the liquid phase. Methyl acetate has a liquid-liquid phase transition at −12°C at atmospheric pressure. The liquid phase is divided into two parts named as L_1 and L_2 corresponding to high and low temperature liquid phases, respectively. An analysis of the T_1-temperature relation resulted in two kinds of mode of the molecular motion. The phase transition corresponds to the change in the molecular motion and the mode whose correlation time is shorter than the other appears in each liquid phase. The L_2 state is a mesomorphic state due to a planar structure of C-CO-O group. A pressure dependence of the transition temperature was obtained from T_1 measurement at high pressure. The value of dP/dT at 150 MPa is about 5×10^6 Pa/deg.

119170 Application of the NRTL model for calculating phase equilibria in ternary systems with immiscibility gaps. Yu.Schmel'tsev, A.I.Victorov, K.Kvich, N.A.Smirnova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.46-51 (Aug. 1983). In Russian.
The results of liquid-liquid and liquid-liquid-vapour equilibria calculations using the NRTL model are presented for 21 ternary systems. Predictions of phase equilibria and correlations of experimental ternary solubility data are made. (7 refs.)

64.70K Solid-solid transitions

(see also 61.50K Crystallographic aspects of polymorphic and order-disorder transformations, 81.30H, 81.30K, 81.30M Microstructures developed by solid-solid phase transformations)

119171 Polymorphic transformations of rare-earth oxides under shock stress. V.N.German, A.M.Podurets, L.A.Tarasova.
Inorg. Mater. (USA), vol.18, no.10, p.1492-4 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1736-8 (Oct. 1982). [received: Sept. 1983]
The rare-earth oxides Sm_2O_3, Er_2O_3, Dy_2O_3, Yb_2O_3, and Y_2O_3 transform from the cubic C phase to a monoclinic B phase after shock compression to pressures of 12-35 GPa. The transformation may be produced by a decrease in the interionic separation in the lattice and electron rearrangement in the metal atoms as a result of the high pressure. (11 refs.)

119172 Structural phase transition in the Chevrel-phase $Ag_{1.6}Mo_6S_8$. Zong-Hao Lee, K.Noto, Y.Muto (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2966-9 (Sept. 1983).
An order-disorder phase transition was found in Chevrel-phase $Ag_{1.6}Mo_6S_8$ at about 280K. From a comparison of results of the electrical resistance and the X-ray diffraction to those in $Cu_{1.8}Mo_6S_8$, this is thought to be a structural phase transition from rhombohedral to triclinic due to the order-disorder transition of Ag atoms. (6 refs.)

119173 X-ray study of phase transition in $NaClO_4$. S.Yamamoto, Y.Shinnaka (Dept. of Phys., Yamaguchi Univ., Yamaguchi, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3080-4 (Sept. 1983).
The phase transition in $NaClO_4$ from the NaCl-type cubic phase (O_h^5) to the orthorhombic phase (D_{2h}^{17}) is investigated with the X-ray diffraction method. In the cubic phase, X-ray diffuse maxima are observed at the *X*-points of the Brillouin-zone boundary. The intensity of the diffuse maximum anomalously increases with decreasing temperature toward the transition point. In the orthorhombic phase, the intensity of the superlattice reflection sharply decreases near the transition point and the lattice constant *b* shows anomalous expansion with increasing temperature. It is suggested that a coupling between multi-orientation of the ClO_4^- ion and phonons plays an important role in the phase transition.

119174 Successive phase transitions in Cs_2CdBr. M.Maeda, A.Honda, N.Yamada (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3219-24 (Sept. 1983).
X-ray and dielectric measurements were made on Cs_2CdBr_4 (CCB) crystals, and optical observation was also made. CCB undergoes successive phase transitions at $T_1=-21°C$, $T_2=-36°C$ and $T_3=-65°C$. The space groups in all phases have been determined: I: Pnam, II: $P_{\bar{1}ss}^{Pnam}$, III: $P2_1/n$ and IV: $P\bar{1}$. The space group for the incommensurate II-phase is determined on the basis of a four-dimensional space group concept. Temperature dependence of the position and the intensity of satellite reflections in the incommensurate phase was measured. Rotation of optical indicatrix was found in III- and IV-phases and its temperature dependence was measured. Ferroelastic activities in III- and IV-phases were found.

119175 Optically detected low temperature phase in pyrene crystals. K.Mizuno, A.Matsui (Dept. of Phys., Konan Univ., Kobe, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3260-4 (Sept. 1983).
Absorption and luminescence spectra in pyrene have been investigated. Absorption spectra below the phase transition point at 120K exhibit structures which are not observed in the room temperature spectra. Below the phase transition temperature another dimeric phase (α') which differs from that in the room temperature phase (α) is suggested to appear. This suggestion is consistent with information reported from the electron diffraction patterns. The relationship between the specimen cooling method and the occurrence of the phase transition is briefly discussed.

119176 Temperature dependence of the wave vector of the incommensurate modulation in two $BaMnF_4$ crystals grown by different techniques; neutron and X-ray measurements. M.Barthes-Regis, R.Almairac, P.St-Gregoire (CNRS, Univ. des Sci. et Tech. du Languedec., Montpellier, France), C.Filippini, U.Steigenberger, J.Nouet, Y.Gesland.
J. Phys. Lett. (France), vol.44, no.19, p.L829-35 (1 Oct. 1983).
Neutron elastic scattering measurements on two incommensurate $BaMnF_4$ crystals show that the incommensurability δ is temperature dependent. The large observed 'global' hysteresis and the sample dependent residual value of the incommensurability at low temperature indicate the importance of lattice defects. A very small angular lattice distortion has been observed below $T_0\simeq250K$ by means of X-ray measurements of the width of some Bragg spots. This observation is in agreement with the theory of the structural

transition in $BaMnF_4$ which predicts the possibility of a ferroelastic strain below $T<T_0$. (12 refs.)

119177 **Studies of structural transitions in TMA-TCNQ-I by high voltage electron diffraction.** T.Granier, R.Ayroles (Lab. d'Optique Electronique, CNRS, Toulouse, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1301-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
By using high accelerating voltage and electron diffraction, the authors show that the trimethylammonium-iodide-tetracyanoquinodimethane or $TMA^+(TCNQ)^{2/3-}(I_3^-)_{1/3}$, having a monoclinic symmetry, exhibit structural transitions at low temperatures: 150K, 90K and 65K. From their studies of electron irradiation effects, they have determined the best conditions for the observation of charge density waves in organic crystals: high voltage and low temperature. (19 refs.)

119178 **Landau theory of pressure induced phase transitions in TTF-TCNQ.** S.Megtert (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), A.Bjelis, J.Przystawa, S.Barisic.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1345-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Transport and structural measurements on TTF-TCNQ under high pressure have revealed a very complex phase diagram. The analysis of the symmetry properties of various displacive modes coupled to the conduction electrons shows that the essential features of this phase diagram can be described with a two-chain model in the framework of the Landau theory. (4 refs.)

119179 **Structural phase transition of $CsPbCl_3$ below room temperature.** M.Hidaka (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), Y.Okamoto, Y.Zikumaru.
Phys. Status Solidi a (Germany), vol.79, no.1, p.263-9 (Sept. 1983).
Studies of the structural phase transition of $CsPbCl_3$ are carried out, using X-ray and neutron diffraction, NQR, and Raman scattering below room temperature. It is confirmed that there is a second-order transition at about 200K (T_{c4}). From the structural analysis, it is determined that, at room temperature, the structure has an orthorhombic symmetry $D_{2h}{}^{16}$-Pbnm, and, below T_{c4}, it has a monoclinic symmetry $C_{2h}{}^5$-$P2_1/c$. The transition at T_{c4} is not associated with the condensation of rotational modes of $PbCl_6$ octahedra around any principal axes, but associated with the elastic soft mode. (15 refs.)

119180 **Mechanism of solid state transformations in single crystals of $Zn_xCd_{1-x}S$.** M.T.Sebastian, P.Krishna (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.271-80 (Sept. 1983).
The mechanism of solid state transformations in single crystals of $Zn_xCd_{1-x}S$ is investigated by annealing metastable 2H crystals at different temperatures, arresting the solid state transformation by quenching in cold water, and examining the structure of the intermediate state by X-ray diffraction. In the range $x=0.93$ to 0.95, the 2H structure is found to transform a disordered 6H structure at temperatures around 600°C. This 6H structure does not transform further to the 3C structure on annealing at higher temperatures. It is observed that the mechanism of the 2H to 6H transformation in these crystals is very different from that proposed by Pandey, Lele, and Krisha (1980) for a similar transformation in SiC. A model of transformation involving the nonrandom insertion of stacking faults is developed using a fault probability α for random nucleation of the 6H phase and a fault probability β for the growth of the 6H nuclei. The diffraction effects calculated from such a model for both, deformation faults and layer-displacement faults are compared with those recorded on a single crystal diffractometer using partially transformed crystals. It is concluded that the model of transformation by a nonrandom insertion of deformation faults with $\beta \gg \alpha$, closely approximates the actual mode of transformation in these crystals. (11 refs.)

119181 **Study of the 25K NpO_2 phase transition by a neutron oscillation camera.** A.Boeuf, R.Caciuffo (Inst. Laue-Langevin, Grenoble, France), J.M.Fournier, L.Manes, J.Rebizant, F.Rustichelli, J.C.Spirlet, A.Wright.
Phys. Status Solidi a (Germany), vol.79, no.1, p.K1-3 (Sept. 1983).
The existence of a phase transition in NpO_2 below 25K was deduced from measurements of macroscopic physical quantities but no evidence based on observations of microscopic quantities has till now confirmed the presence of this phase transition. (8 refs.)

119182 **Theory of the structural phase transition in A15 compounds.** M.Kataoka (Res. Inst. for Iron, Steel and Other Metals, Tohoku Univ., Sendai, Japan).
Phys. Rev. B (USA), vol.28, no.5, p.2800-15 (1 Sept. 1983).
The structural phase transition in the *A*15 compounds are investigated theoretically with the standpoint that the band Jahn-Teller effect of the two-fold-degenerate Γ_{12} subbands crossing the Fermi level is responsible for the instability. On the basis of $\vec{k}.\vec{p}$ perturbation theory, the Γ_{12} subbands are revealed to be well described by two parabolic bands which couple not only to the bulk distortions, but also to the displacements of the Γ_{12} optic modes. It is found that when the electron-lattice coupling exceeds the threshold of strength, the tetragonal phase with almost the same stabilities of $c/a>1$ and $c/a<1$ appears, accompanying one of the Γ_{12} optic modes below a weak first-order phase transition temperature T_M. The temperature dependences of the elastic moduli are calculated; it is found that c_{11}-c_{12} vanishes below T_M while c_{33}-c_{13} recovers from its softening partially or completely with decreasing temperature below T_M while c_{33}-c_{13} recovers from its softening partially or completely with decreasing temperature below T_M. The long-wavelength acoustic phonons are also investigated in order to clarify the relation between the phonon anomalies and the structural transition. The $[110]T_1$ mode $(\vec{q}\,\|\,[110],\ \vec{e}\,\|\,[1\bar{1}0])$ is considerably softened in the range $0<q\lesssim 2k_F$. This softening begins at high temperatures, remaining even at absolute zero. The theory explains successfully the various aspects of the phase transitions in V_3Si and Nb_3Sn. The comparison between them proves that the second-order Jahn-Teller effect occurs in both compounds. (51 refs.)

119183 **Pressure-induced phase transition in β-$LiIO_3$.** V.Lemos, J.M.Filho, F.E.A.Melo, R.S.Katiyar, F.Cerdeira (Inst. de Fisica 'Gleb Wataghin', Univ. Estadual de Campinas, Sao Paulo, Brazil).
Phys. Rev. B (USA), vol.28, no.6, p.2985-9 (15 Sept. 1983).
The authors report the first observation of a pressure-induced phase transition in $LiIO_3$. A new phase appears when β-$LiIO_3$ is compressed hydrostatically at room temperature, beyond 50 kbar. This is a reversible first-order transition with negligible hysteresis. The new phase (δ-$LiIO_3$) cannot be obtained by heating or cooling either α- or β-$LiIO_3$ or by compressing the former. They observe the transition by studying the evolution of the Raman spectrum of β-$LiIO_3$ as a function of pressure (1 bar-95 kbar). They also report a detailed study of the pressure dependence of Raman frequencies for β-LiO_3. The regularities observed in the mode-Gruneisen parameters and other pressure coefficients for the β phase give insight into the probable structure of the high-pressure phase. (17 refs.)

119184 **High-pressure X-ray diffraction studies on HgTe and HgS to 20 GPa.** A.Werner, H.D.Hochheimer, K.Strossner (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany), A.Jayarman.
Phys. Rev. B (USA), vol.28, no.6, p.3330-4 (15 Sept. 1983).
HgTe and HgS have been investigated with the use of the high-pressure X-ray diffraction technique to 20 GPa. HgTe undergoes three pressure-induced phase transitions in the (0-20)-GPa range, from zinc blende to cinnabar to rocksalt to β-Sn, at 1.4, 8, and 12 GPa, respectively. HgS does not show any evidence for a transition from the cinnabar structure up to 20 GPa, either in high-pressure X-ray diffraction or in high-pressure Raman studies. The above transition sequence agrees with the pressure-induced sequence for CdTe except for the intrusion of a cinnabar structure. Evaluation of the bulk modulus B_0 and B'_0 are 19.4 ± 0.5 GPa, and 11.1 for HgS, and 16.0 ± 0.5 GPa and 7.3 for HgTe. Bulk moduli, volume changes for transitions, and lattice parameters of the high-pressure phases have all been determined from the X-ray data. The observed transition sequence for HgTe appears to be in agreement with the predictions of recent pseudopotential total-energy calculations for phase stability in III-V and II-VI compounds under pressure. (18 refs.)

119185 **Neutron powder diffraction study of phase transitions and structures of $(KCN)_x(KBr)_{1-x}$ mixed crystals.** J.M.Rowe, J.J.Rush (Nat. Measurement Lab., NBS, Washington, DC, USA), S.Susman.
Phys. Rev. B (USA), vol.28, no.6, p.3506-11 (15 Sept. 1983).
The structures of $(KCN)_x(KBr)_{1-x}$ mixed crystals for $x=0.95$, 0.90, and 0.80 have been determined as a function of temperature. As the temperature is decreased from 295K, where all of the samples are cubic (as are pure KCN and KBr), all samples measured transform to a monoclinic structure (space group C_c). For $x=0.95$ and 0.90, at a lower temperature there is a further transition to an orthorhombic structure similar to that found for pure KCN below 168K. However, the samples do not transform completely, and the monoclinic and orthorhombic structures coexist down to 6K. More of the sample transforms for $x=0.95$ than for $x=0.90$. In both cases, that part of the sample which goes into the orthorhombic phase orders completely at the lowest temperatures, in a structure similar to that found for pure KCN at 6K. (15 refs.)

119186 **Phase transition in cadmium chlorapatite $[Cd_5(PO_4)_3Cl]$.** Hong Lee Park, Min Soo Jang (Dept. of Phys., Busan Nat. Univ., Busan, Korea).
Solid State Commun. (USA), vol.48, no.2, p.109-10 (Oct. 1983).
The phase transition in cadmium chlorapatite from $P6_3/m$ ($C_{6h}{}^2$) to $P6_3/mcm$ ($D_{6h}{}^3$) has been confirmed through the temperature dependent Raman measurements. The phase transition temperature (T_c) from lower temperature phase ($P6_3/m$) to high temperature phase ($P6_3/mcm$) is approximately 700°C and is detected through the disappearing of LT phase A_g Raman bands as the temperature approaches to T_c. (3 refs.)

119187 **Hydrate to pseudohydrate transformation in $Cd(ClO_4)_2.6H_2O$: An IR study.** M.B.Patel, H.D.Bist (Dept. of Phys., Indian Inst. of Technol., Kanpur, India).
Solid State Commun. (USA), vol.48, no.2, p.139-41 (Oct. 1983).
The modes of water in $Cd(ClO_4)_2.6H_2O$ exhibit a sharp discontinuity at 248 ± 1K. The appearance of new bands attributable to the OH^- and H_3O^+ ions below 248K indicates the transformation of the normal hydrate to a pseudohydrate. A strong Fermi resonance is observed between ν_1 and $2\nu_4$ bands of H_3O^+. (12 refs.)

119188 **Magnetic, elastic, and thermal properties of Rb_2NaHoF_6.** R.Sh.Zhdanov, F.L.Aukhadeev, A.B.Liberman, N.I.Silkin, M.A.Teplov, Sh.I.Yagudin, M.Sh.Yagfarov (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.535-6 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.929-31 (March 1983). [received: Oct. 1983]
Holmium hexafluoride Rb_2NaHoF_6 has the cubic structure of elpasolite (complex perovskite) at room temperature. Crystals with this structure exhibit ferroelectric phase transitions. The authors report evidence of a domain structure in this crystal at low temperatures and of a structural transition at $T_c=167\pm2$K. (5 refs.)

119189 **Computation of phase transformations in heterogeneous solids.** H.Dohler, H.Strobel (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.139-46 (1983). In German.
Numerical examples are calculated for different types of processes of exchange of particles within a 2-box-model, distinguished in Z. Phys. Chemei 261 (1980) 876. Thier evaluation renders it possible to investigate the differential equations of the model qualitatively. The solutions may serve for mathematical modelling the dependence of time of phase transformations accompanied by exchange of matter. This may be applied to a system of thin films, or to a heterogeneous medium made up of a mixture of grains occurring in two different phases, or of a solid with growing nuclei included (sintering, Otswald-type ripening martensitic transformations). No use of the assumption of local thermodynamic equilibrium within the phase boundary regime has to be made. Processes controlled by reactions at the interfaces are admitted. (9 refs.)

64.70M Transitions in liquid crystals

119190 The nematic elastic constants from the Ginzberg-Landau Hamiltonian of the nematic to isotropic phase transition. K.Rosciszewski (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.277-83 (Sept. 1983).
The nematic elastic constants are obtained from the Ginzburg-Landau Hamiltonian (of the nematic is isotropic phase transition) with two order parameters. The first order parameter is the well known symmetric traceless second rank tensor and the second one is a fourth rank tensor. (10 refs.)

119191 Phase transition of nematic polymers in elongational flow. P.Maissa, A.Ten Bosch, P.Sixon (Lab. de Phys. de la Matiera Condensee, CNRS, Nice, France).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.9, p.757-65 (Sept. 1983).
The purpose of the article is to investigate the effect of elongational flow within the mode of elastic wormlike chains used previously to calculate the phase transition of semirigid polymers (Ten Bosch et al. 1980). (41 refs.)

119192 Pressure studies of liquid crystalline transitions. R.Shashidhar (Raman Res. Inst., Bangalore, India).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.13-30 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Some of the important results emerging from recent pressure studies of liquid crystalline transitions are presented. In particular, the following topics are discussed: (i) The relation between P_m, the maximum pressure of smectic stability in reentrant mesogens, and the range of the nematic phase at atmosphere pressure vis-a-vis the molecular structure; (ii) Piezothermal studies in the vicinity of the A-N transition in 8 OCB; (iii) The influence of molecular ordering on the pressure behavior of the nematic-isotropic transition in reentrant nematic mixtures; and, (iv) The relation between the pressure behavior of the smectic A phase and the interdigitation of the molecules. (38 refs.)

119193 Smectic C-nematic transition in the mixtures 5_x6_{1-x}BABA. K.Usha Deniz, P.S.Parvathanathan, J.V.Yakhmi, A.V.Patankar (Bhabha Atomic Res. Centre, Bombay, India).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.83-9 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Describes DSC investigations of the (S_c-N) transition in the mixtures 5_x6_{1-x}BABA, for $0 \leq x < 1$. This transition could only be observed for $x \leq 0.8$. A marked difference was found in the chain length dependences of both the transition temperature, T_{CN}, and the transition entropy, ΔS_{CN}, between the pure and mixed compounds. This might be ralated to the difference between end hydrocarbon chain conformations of 5BABA and 6BABA. Specific heat measurements show (i) for $x=0$, a first order transition with hardly any fluctuations, (ii) for $x=0.59$, an almost continuous transition, but again with weak fluctuations. The fact that the fluctuations remain weak near T_{CN} even when ΔS_{CN} is very small, is attributed to large bare coherence lengths. (11 refs.)

119194 Transitions and relaxations in mesophase polymers: thermotropic liquid crystalline polyesters with mesogenic groups in the main chain. V.Frosini, S.de Petris (Dept. of Chem. Engng., Univ. of Pisa, Pisa, Italy), E.Chiellini, G.Galli, R.W.Lenz.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.223-42 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The thermal and dynamic viscoelastic behavior of some thermotropic liquid crystalline polyesters based on α, ω-bis(4-hydroxybenzoyloxy)alkanes, and terephthalic acid is reported. Original samples obtained by solution polymerization followed by precipitation showed physical and dynamic-mechanical properties typical of semicrystalline polymers. Quenching of the polymers from the LC state gave rise to glass-like mesomorphic modifications that retained a glass transition at considerably higher temperature T_{gm} than that of the corresponding amorphous material T_{ga}. However, the formation of a new crystal form with respect to the original sample could not be prevented and the polymers so obtained were in fact partially mesomorphic and partially crystalline materials. All the quenched samples exhibited by dynamic-mechanical and calorimetric analyses a first order solid-solid transition independent of the length of the flexible spacer. Such a phenomenon was interpreted as an order-disorder transition of the material quenched from the LC state. (13 refs.)

64.70P Glass transitions

119195 Homogeneous equilibria in liquid alloys and glass formation. F.Sommer (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.749-56 (Sept. 1983).
Using homogeneous equilibria reactions for the description of chemical short range order tendencies in liquid alloys with compound forming tendency it is possible, using the association model, to describe different kinds of asymmetrical concentration dependences, to calculate the temperature dependences of the thermodynamic mixing functions as well as to extrapolate for multicomponent systems. The existence of chemical short range order is an important factor of influence on the glass forming ability obtained by rapid quenching from the liquid phase. On the one hand, it causes small chemical driving forces for crystallization and, thereby, thermodynamic promotion of glass formation. On the other hand, glass formation is additionally kinetically favoured if the stoichiometric compositions of the associates in the liquid alloys are not in accordance with those of the crystalline equilibrium phases in the glass formation range. (32 refs.)

119196 Effect of copolymerization on the glass transition temperature of PAN. N.Chand (Chem. Engng. Div., Nat. Chem. Lab., Pune, India).
Indian J. Technol., vol.21, no.3, p.126-7 (March 1983). [received: Oct. 1983]
Two copolymers of different compositions of PAN and HEMA have been prepared and their glass transition temperatures determined by a dielectric technique. The effect of copolymerization on the structure of PAN has also been discussed. (4 refs.)

119197 Properties of glasses in the system AgI-Ag_2O-B_2O_3. G.H.Frischat, S.Speyer, W.Wegener (Inst. fur Nichtmetallische Werkstoffe, Tech. Univ. Clausthal, Gottingen-Clausthal, Germany).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.122-3 (Aug. 1983).
Glasses with AgI contents between 75 and 50 mol.% were prepared in the pseudo binary system AgI-Ag_2O-B_2O_3 by different methods and at varied cooling rates. Glass transition temperatures, densities, and thermal expansion coefficients were measured and compared with literature data. Thermal history markedly influences the properties. (9 refs.)

119198 Effect of vitrification pressure on radius of gyration, specific heat and density of amorphous polymers. J.M.O'Reilly (Res. Labs., Eastman Kodak Co., Rochester, NY, USA), R.S.Stein, G.Hadziioannou, G.D.Wignall.
Polymer (GB), vol.24, no.10, p.1255-8 (Oct. 1983).
The effects of vitrification pressure (to 500 MPa) and temperature (to 180°C) on the radius of gyration (as determined by small-angle neutron scattering), specific heat and density were measured for polystyrene and poly(methyl methacrylate). The radius of gyration increased slightly (5×10^{-3}/°C) in both polymers; this increase is near the experimental uncertainty in the measurements. The small observed values are due to either small intrinsic effects of temperature or pressure on the conformation or competing effects of temperature and pressure. Density and specific heat showed changes which have been observed before and are attributed to intermolecular factors. (12 refs.)

64.75 SOLUBILITY, SEGREGATION, AND MIXING

119199 The enthalpy effect on forming diluted solid solutions of two 4d and 5d transition metals. A.K.Niessen, A.R.Miedema (Philips Res. Labs., Eindhoven, Netherlands).

Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.717-25 (Sept. 1983).

Predictions of the enthalpies of solution in the solid state will be presented for arbitrary combinations of 4d and 5d transition metals. In addition to the contribution stemming from the chemical interaction, which is equal to the enthalpy of solution in the liquid state, the enthalpy of solution in the solid state contains two other terms. The first of these accounts for the elastic energy arising from the atomic size mismatch, where this size mismatch has been corrected for volume changes that accompany the alloy formation. The second term takes into account the variation of the structure dependent energy in relation to the number of d-electrons per atom. The predictions are generally in good agreement with the solubilities found in the respective phase diagrams. For two systems, Zr in Pt and Pt in Nb, that on first sight present exceptions, preliminary experiments indicate that parts of the respective phase diagrams have to be revised. The structure-dependent contribution manifests itself not only in the limiting solubilities in the main crystal structures of the pure metals but also in the existence of disordered intermediate phases and may also be responsible for the anomalously large entropy of fusion recently observed for some transition metals. (18 refs.)

119200 Calorimetric investigations of liquid alkaline earth metal alloys. F.Sommer, J.J.Lee, B.Predel (Inst. fur Metallkunde, Univ. Stuttgart, Stuttgart, Germany).

Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.792-7 (Sept. 1983).

The concentration dependences of the enthalpy of mixing of liquid copper-magnesium and calcium-copper alloys have been determined, applying direct mixing calorimetry, in the temperature range between 1120 and 1125K. The enthalpies of mixing are discussed in connection with known thermodynamic quantities and the asymmetrical concentration course obtained can be described by an association model. Systematic comparison is carried out between the experimentally obtained enthalpies of mixing—together with other recent experimental data—and those obtained according to the Miedema model (1980). The concentration dependence used in the model is not able to describe the results of alloy melts with strong compound formation tendency. The enthalpy of mixing can be calculated in nearly 40% of the systems investigated with less than 30% error and in 64% with an error less than 2.5 kJ mol^{-1}. (40 refs.)

119201 The use of lattice theory in the calculation of excess properties of fluid mixtures. VI. Prediction of Gibbs' free energies and enthalpies of mixing of binary systems using model by Tompa. K.Suhnel (Sektion Chem., Karl-Marx-Univ. Leipzig, Leipzig, Germany).

Chem. Tech. (Germany), vol.35, no.9, p.469-74 (Sept. 1983). In German.

The applicability of the lattice model by Tompa (1953) was investigated for the prediction of vapour-liquid equilibria and enthalpies of mixing of binary nonelectrolyte systems with different polar components. The prediction of VLE and H^E was difficult for mixtures containing two components with either very little difference in polarity or with considerable differences in their molar volumes. The precalculation of thermodynamic mixing properties of all other systems was possible with two constant parameters and a third parameter depending linearly on the chain length of n-paraffins. The deviation between experimental and predicted properties were compared with those given by UNIFAC or with those obtained using a predictive Barker (1952) model. (135 refs.)

119202 Solution of the coalescence kinetics problem after Ostwald. R.D.Vengrenovich.

Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.27-32 (1983). In Ukrainian.

A new method is suggested to solve the initial system of differential equations which determine coalescence kinetics after Ostwald. The effect of the matrix crystal structure on the particle size distribution function is taken into account. (12 refs.)

119203 LCST behaviour in blends of PMMA with PVC. H.Jager, E.J.Vorenkamp, G.Challa (Lab. of Polymer Chem., State Univ. of Groningen, Groningen, Netherlands).

Polym. Commun. (GB), vol.24, no.10, p.290-2 (Oct. 1983).

It is difficult to draw conclusions about the compatibility of polymer blends, when a lower critical solution temperature (LCST) is situated at a temperature where diffusion of the polymer chains is strongly hindered by the high viscosity of the blend. This is demonstrated on the system at PMMA/PVC, which showed, compatibility at all compositions only when prepared at low temperatures from mixed solutions. Heating to high temperature causes demixing, not followed by remixing after cooling, because of kinetic reasons. In reducing the molar mass of one or both polymer samples, the viscosity of the blend decreased and the LCST increased, which made it possible to observe an equilibrium LCST behaviour of this blend. (10 refs.)

119204 Study of the system $NH_4Fe(SO_4)_2$-H_2SO_4-H_2O or 25°C and the appearance of solid phases. L.Kristanova, T.Tomov (Forschungslab. fur anorganische Salze, Bulgarischen Akad. der Wissenschaften, Sofia, Bulgaria).

Izv. Khim. Bulg. Akad. Nauk. (Bulgaria), vol.15, no.4, p.508-18 (1982). In German. [received: Sept. 1983]

The solubility at 25°C of the $NH_4Fe(SO_4)_2$-H_2SO_4-H_2O system was investigated and the fields of crystallization outlined. There are fields of $NH_4Fe(SO_4)_2 12H_2O$ and $NH_4Fe(SO_4)_2.3H_2O$ in the system. It was found that on dehydration the ammonium ferric alum changes into the stable $NH_4Fe(SO_4)_3.3H_2O$. The trihydrate is stable up to a definite concentration of sulphuric acid. At higher acid concentrations it decomposes affording $Fe_2(SO_4)_3.H_2SO_4.8H_2O$ as solid phase. The solid phases were investigated by X-ray diffraction, DTA, infrared and Mossbauer spectra. (20 refs.)

119205 Excess properties of binary solvent mixtures containing bromobenzene. T.M.Aminabhavi, E.S.Jayadevappa, B.R.Prasad (Dept. of Chem., Karnatak Univ., Dharwad, India).

Indian J. Chem. A, vol.22A, no.3, p.227-8 (March 1983). [received: Oct. 1983]

Excess polarisabilities and excess volumes of mixing have been measured at 20°C for four binary systems of bromobenzene with benzene, cyclohexane, ethyl acetate and carbon tetrachloride as a function of composition of the mixture. Bromobenzene-carbon tetrachloride system has the largest value for excess polarisability of mixing, while its excess volume is the lowest as compared to the other systems. The Lorentz-Lorenz mixing rule seems to be the best among the existing mixing rules for explaining the present data. (5 refs.)

119206 Enthalpy coefficients of pairwise interactions between polar molecules and long-chain aliphatic ions in water at 298.15K. R.Bury, A.Mayaffre, C.Treiner (Lab. d'Electrochimie, Univ. Pierre et Marie Curie, Paris, France).

J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2517-28 (Oct. 1983).

The enthalpy of dissolution of trimethyldecylammonium bromide has been determined in the water-rich region of binary mixtures with dimethylsulphoxide, *N*-methylpyrrolidone, *NN*-dimethylformamide, propan-1-ol, urea and acetonitrile. Some additional measurements are also presented for tetrabutylammonium bromide in some of these binary solvent mixtures. From these data the enthalpy coefficient of pairwise interaction h_{NE} has been calculated. A discussion is presented on the enthalpy of pairwise interaction of aliphatic ions with 12 polar molecules in water. Using the scaled particle theory, the cavity contribution to the h_{NE} values is calculated and shown to be large in comparison with the interaction contribution in all cases except alcohols and acetonitrile. From a comparison of h_{NE} values for the long chain surfactant and for the bulky tetrabutylammonium ion, two different classes of organic molecules emerge: (1) acetonitrile, acetone, 2-methylpropan-2-ol and propan-1-ol and (2) the other polar molecules studied, which include sulpholane, propylene carbonate, dioxane and ethylene glycol. Class (1) decrease the critical micelle concentration of surfactants in water through partitioning between water and the pseudo-micellar phase; class (2) increase the critical micelle concentration and do not interact with the micelles. Thus the behaviour of molecules at post-micellar concentrations may be deduced from information on the thermodynamics of pre-micellar solutions. (35 refs.)

119207 Thermodynamics of liquid mixtures of nitrous oxide and ethene. L.O.Lobo, L.A.K.Staveley (Inorganic Chem. Lab., Oxford Univ., Oxford, England), P.Clancy, K.E.Gubbins, R.S.Machado.

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1399-415 (Sept. 1983).

Experimental determinations of the vapour pressures, molar volumes and heats of mixing are reported for liquid mixtures of ethene and nitrous oxide at temperatures close to the triple-point temperature of nitrous oxide (182.32K). From these measurements the excess volume, Gibbs free energy and enthalpy are derived. The excess Gibbs energy and the excess enthalpy are found to be positive, almost symmetric functions of composition, with values at the equimolar composition of 168.9 J mol^{-1} and 270.9 J mol^{-1}, respectively. The excess volume, on the other hand, is found to be negative and displays a highly skewed composition dependence, the minimum occurring at $x(N_2O) \approx 0.96$. These results were examined theoretically by the use of a perturbation theory based on spherical reference molecules. The importance of using a full non-axial treatment of the quadrupolar interactions between constituent molecules of the mixture is demonstrated. The effect of contributions to the free energy from the quadrupole-dispersion, anisotropic-dispersion and shape forces is shown to be of considerable importance in predicting the excess enthalpy. None of the intermolecular potential models studied was able to reproduce the shape of the excess-volume curve. (39 refs.)

119208 The unexpectedly high solubility of water in cryogenic liquids. R.Rebiai (Inst. of Cryogenics, Univ. of Southampton, Southampton, England), A.J.Rest, R.G.Scurlock.

Nature (GB), vol.305, no.5933, p.412-13 (29 Sept. 1983).

Confirms the unexpectedly high solubility of H_2O in liquid nitrogen (10.0×10^{-6} mole fraction), liquid oxygen (10.1×10^{-6} mole fraction) and liquid methane (60×10^{-6} mole fraction) at their respective normal boiling points by using Fourier transform IR spectroscopy. The possibilities of experimental artefacts are eliminated by parallel experiments with D_2O. (6 refs.)

119209 Active-coupling mixing times for a stirred binary liquid. N.Easwar, J.V.Maher, D.J.Pine, W.I.Goldburg (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Phys. Rev. Lett. (USA), vol.51, no.14, p.1272-4 (3 Oct. 1983).

Mixing times measured for a stirred critical binary liquid mixture are seen to vary dramatically with Reynolds number, Prandtl number, and the initial value of the order parameter. These variations are far too large to be explained by passive-mixing calculations; they also differ in significant respects from the active-mixing predictions of Ruiz and Nelson. (8 refs.)

119210 Phase separation in blends of homopolymer and graft copolymer based on styrene and butadiene. Ming Jiang, Xiu-yun Huang, Tong-yin Yu (Chem. Dept. & Inst. of Material Sci., Fudan Univ., Shanghai, China).

Polymer (GB), vol.24, no.10, p.1259-66 (Oct. 1983).

A series of blends of homopolystyrene and styrene-*g*-butadiene copolymer with different combinations of molecular weights of the copolymer and graft polystyrene segments have been prepared. Phase separation behaviour of the blends has been examined by electron microscopy. The results reveal a regular change of morphology of the blends with the relative molecular weights of the free and graft polystyrene chains. The observed relationships between compatibility of the homopolymer and copolymer and the relative molecular weight are generally in agreement with that observed previously in homopolymer-block copolymer blends. Taking the inherent polydispersity of the molecular weight of the component polymers into account, some peculiarities of the morphologies of the blends have been explained. (22 refs.)

119211 Compatibility among chlorinated polyethylenes. C.Zhikuan, S.Ruona (Inst. of Chem., Acad. Sinica, Beijing, China).

Polymer (GB), vol.24, no.10, p.1279-85 (Oct. 1983).

Compatibility among chlorinated polyethylenes with different degrees of chlorination has been identified by the transparency of blended films cast from solvent. Dynamic mechanical measurements have been used to check these observations. The heats of mixing of pairs of chlorinated octadecanes with different degrees of chlorination have been measured and shown to be positive. It has been found that in this system, which is dominated by dispersion forces, compatibility is determined by similarity of the equation-of-state parameters. The Flory equation-of-state theory without the interaction entropy parameter Q_{12} generates a positive ΔG_m and hence fails to predict compatibility. A positive Q_{12} is needed to remedy this deficiency of the theory. This is in direct contrast to the negative Q_{12} which is introduced in the systems which are dominated by specific interactions. (12 refs.)

119212 Selective dissolution of dendritic or interdendritic phase in Sn-Al alloys. M.Datta, B.Giovanola, J.-L.Kolub (Materials Dept., Swiss Federal Inst. of Technol., Lausanne, Switzerland).

Prakt. Metallogr. (Germany), vol.20, no.8, p.394-405 (Aug. 1983). In English, German.

Anodic behavior of Sn, Al and their alloys has been studied in NaOH and K_2SO_4 solutions in order to determine conditions which lead to selective dissolution of an Sn-Al alloy. In this alloy Al dendrites grow in Sn matrix. Results obtained illustrate the usefulness of potentiostatic polarization in achieving selective dissolution of either Al dendrites or interdendritic Sn matrix. (19 refs.)

64.80 OTHER PHASE PROPERTIES OF SYSTEMS

119213 High resolution electron microscopic study of oxide particles produced by the coalescence of smoke particles of iron and iron oxide. C.Kaito (Dept. of Phys., Kyoto Tech. Univ., Kyoto, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L432-4 (July 1983).
The structure of particles in a mixture of Fe smoke and γ-Fe_2O_3 smoke prepared by gas evaporation were investigated by crystal lattice imaging in high-resolution electron microscopy. Fe_3O_4, Fe_3O_4+Fe and $Fe_3O_4+\alpha$-Fe_2O_3 particles are formed by the coalescence of Fe and γ-Fe_2O_3 particles above 350°C. (14 refs.)

119214 Brownmillerite-type microdomains in the calcium lanthanum Ferrites: $Ca_xLa_{1-x}FeO_{3-y}$. I. $^2/_3<x<1$. M.A.Alario-Franco, J.M.Gonzales-Calbet, M.Vallet-Regi (Dept. de Quimica Inorganica, Univ. Complutense, Madrid, Spain), J.C.Grenier.
J. Solid State Chem. (USA), vol.49, no.2, p.219-31 (Sept. 1983).
The study by high resolution electron microscopy and electron diffraction of several oxidized samples of the calcium lanthanum ferrites $Ca_xLa_{1-x}FeO_{3-y}$, with different values of x and y, prepared at high temperatures in air, shows the existence of a microdomain texture in which brownmillerite-type microdomains with a volume of $\sim 10^6$ Å^3 are intergrown within a $Ca_2LaFe_3O_8$ substructure. This situation was not detected by conventional powder X-ray methods, where a simple cubic perovskite unit cell with constant parameters was observed ($a=3.849(1)$ Å for $x=0.8$ and $a=3.848(1)$ Å for $x=0.9$). Electron micrograph images of the microdomain texture show that fringe periodicity is very regular, suggesting that the oxygen excess is situated in the domain walls. (8 refs.)

119215 Deuterium short-range order in $Pd_{0.975}Ag_{0.025}D_{0.685}$ by diffuse neutron scattering. O.Blaschko, R.Klemencic, P.Fratzl, P.Weinzierl (Inst. fur Experimentalphys., Univ. Wien, Wien, Austria), G.Ernst, O.J.Eder, J.Kjems.
Phys. Rev. B (USA), vol.28, no.6, p.3579-81 (15 Sept. 1983).
By diffuse neutron scattering the D short-range order in a $Pd_{0.975}Ag_{0.025}D_{0.685}$ crystal was investigated at 50 and 70K. The results are compared with the D ordering in the PdD_x system previously investigated, and it is shown that the isointensity contours around the $(^1/_2,1,0)$ point are similar to that observed in $PdD_{0.71}$. One may conclude that the characteristic changes in the short-range-order intensity which occur near $x=0.7$ in PdD_x with concentration are due to changes of the electronic structure. (10 refs.)

119216 Heat capacity of a five-coordinated iron (III) complex, iodobis(*N,N*-dimethyldithiocarbamato) iron (III), between 0.4 and 300K. M.Yoshikawa, M.Sorai, H.Suga, S.Seki (Dept. of Chem., Osaka Univ., Osaka, Japan).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.975-84 (1983).
The heat capacity of iodobis (*N,N*-dimethyldithiocarbamato)iron (III) has been measured between 0.4 and 300K. Based on the heat capacity and entropy at low temperatures it was found that the present sample consists of a mixture of monomer (*ca.* 40%) and dimer (*ca.* 60%); the former brings about a λ-type phase transition from an antiferromagnetic to a paramagnetic state at $T_N=(1.65\pm0.04)$K while the latter exhibits a Schottky-type anomaly due to antiferromagnetic dimeric coupling, the effect of which becomes dominant below *ca.* 0.7K. The zero-field splitting parameter of a single ferric ion was estimated to be $D/k=D_D/k=14$K for the monomer and the dimer, while the dimeric coupling constant was $J_D/k=-0.15$K. The entropy at low temperatures cannot be accounted for solely by the spin manifold. Additional contribution from a tunnel-splitting of the rotational levels of four constituent methyl-groups has been discussed. In this case, the level splitting of the ground state is 2.5 J mol^{-1} and the barrier height of hindering potential is 2.3 kJ mol^{-1}. (25 refs.)

119217 Low-temperature specific heat of vapour-deposited Ge_xSe_{1-x} glass (x=0.3). M.Mertig, G.Pompe, E.Hegenbarth (Wissenschaftsbereich Tieftemperaturphys., Sektion Phys., Tech. Univ. Dresden, Dresden, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K49-52 (Sept. 1983).
The binary system Ge_xSe_{1-x} is an amorphous semiconductor with a wide glass-forming region. The authors present the first measurement of the specific heat of an amorphous $Ge_{0.3}Se_{0.7}$ film system. The results are compared with results of an equivalent bulk sample in order to investigate the influence of the method of preparation. (15 refs.)

65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

119218 Recent developments in the experimental determination of thermodynamic quantities of metals and alloys. K.L.Komarek (Inst. fur Anorganische Chem., Univ. Wien, Wien, Austria).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.709-17 (Sept. 1983).
Recent developments of experimental techniques for the measurement of thermodynamic quantities of metals and alloys are reviewed. Special emphasis is placed on calorimetry of reacting and nonreacting systems, EMF methods with liquid and solid electrolytes, and the various Knudsen effusion methods. (136 refs.)

119219 Thermodynamics of compounds with narrow ranges of nonstoichiometry. H.Schmalzried (Inst. fur Phys. Chem. und Elektrochem., Univ. Hannover, Hannover, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.726-33 (Sept. 1983).
Thermodynamic functions of compounds with narrow ranges of homogeneity are calculated with the aid of the concept of defect thermodynamics. In doing so, the irregular structural elements of a crystal are formally treated as quasi-particles in dilute solution on their respective sublattices. This concept is illustrated with binary and ternary ionic crystals (for example $Fe_{3-\delta}O_4$; $Ag_{2+\delta}S$; $Co_{1-\delta}O$; $(Co, Mg)_{1-\delta}O$; $(Fe, Mg)_{2-\delta}SiO_4$). The nonstoichiometry δ of these compounds is calculated as a function of the independent thermodynamic variables and compared with experimental results. (20 refs.)

119220 Electronic and elastic influences on the energetics of alloy formation. H.-J.Schaller (Inst. fur Phys. Chem., Univ. Kiel, Kiel, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.734-41 (Sept. 1983).
Palladium and platinum alloys have turned out to be useful subjects for relating thermodynamic properties with electronic and elastic quantities of the components. The mixing behavior of a number of interstitial and substitutional alloys exhibits analogous characteristics and may be interpreted by means of the same model. Two effects are discussed to account for nonideal properties. An 'electronic' effect is based on the observation that a number of alloy components behave as electron donors with respect to Pd and Pt. The charge transfer gives rise to a bonding contribution which is determined by the Fermi levels of the components and the valency of the solute. Extremely negative deviations from ideal mixing behavior have been predicted and observed upon adding unnoble components such as Al, Zr, Th or rare earth metals. For a number of Pd alloys the rise of the Fermi energy can be described as a function of the valence electron concentration only, irrespective of the particular donor. An 'elastic' effect is associated with the lattice distortion brought about by the dissolved particles. Models based on continuum elastic considerations are discussed in order to estimate the strain energy at infinite dilution. This quantity is correlated with the pair interaction energy in the quasichemical approach, which was used to calculate the concentration dependence of the elastic contribution. (36 refs.)

119221 High temperature thermodynamics of solutions of hydrogen and deuterium in palladium and its alloys. O.J.Kleppa (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.741-9 (Sept. 1983).
The solutions of hydrogen in palladium and its alloys are classical examples of interstitial metallic solutions. Although these alloys have been studied for a very long time, a good deal of new information has become available in recent years, partly as a result of the application of the combined calorimetric-equilibrium approach. This experimental method allows essentially simultaneous determinations of the Gibbs energies, the enthalpies and the entropies of solution. This approach has been particularly essentially simultaneous determinations of the Gibbs energies, the enthalpies and the entropies of solution. This approach has been particularly useful in throwing new light on the temperature dependence of the thermodynamic properties, and also on their dependence on the alloying constituents. Special interest is attached to the new information on the partial entropies of hydrogen, which points strongly toward a temperature-dependent, nonrandom distribution of the hydrogen atoms among the available interstitial sites. (34 refs.)

119222 Enthalpy measurements on refractory metals and alloys by levitation calorimetry. M.G.Frohberg (Inst. fur Metall., Tech. Univ. Berlin, Berlin, Germany), G.Betz.
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.782-5 (Sept. 1983).
Measurements of enthalpy by levitation drop-calorimetry the principle of measurement, experimental data on Nb, Mo, Ta in solid and liquid states, determination of enthalpies of mixing by the levitation technique, temperature measurement and investigations of Fe-Cu and Nb-Si alloys are described. (13 refs.)

119223 Thermodynamic properties of Pt-B solid solutions. H.Brodowsky, H.Sagunski (Inst. fur Phys. Chem., Univ. Kiel, Kiel, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.803-5 (Sept. 1983).
The activity coefficients on B in Pt were determined at 1200 and 1300K by equilibrating Pt with B_2O_3 in a controlled H_2-H_2O atmosphere and measuring the weight gain. The partial molar excess Gibbs energies at vanishing B concentration are -44 and -43 kJ/mol., respectively. The atomic fractions at the solidus line are 0.036 and 0.031. A relative lattice contraction of the solid solutions prepared at 1200 and 1300K of $(1/a)(\partial a/\partial x_B)=-0.042$ and of -0.035 ± 0.002 was observed. This dependence of the lattice constant on the temperature of preparation suggests a mixed occupation of lattice and interstitial sites, with the majority of B atoms on lattice sites. (19 refs.)

119224 Thermodynamic properties of Pd-X-alloys, with X=Gd, Y, Ce. S.Paasch, H.-J.Schaller (Inst. fur Phys. Chem., Univ. Kiel, Kiel, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.812-14 (Sept. 1983).
Electromotive force measurements on cells with a CaF_2 solid electrolyte were used to determine the activities of Gd, Y, and Ce in Pd-rich alloys between 700°C and 800°C. The thermodynamic properties of these alloys are characterized by extreme negative deviations from ideal mixing behavior, up to -400 kJ/mol. for the partial molar excess Gibbs energy of Ce and up to -320 kJ/mol. for Gd and Y. The high thermodynamic stability of these alloys is attributed to a transfer of valence electrons to the electron gas of the alloy. At infinite dilution the resulting bonding contribution to the partial excess free energy is determined by the difference of the Fermi levels of the components and the valency of the solute. Including the size difference of the components as an additional effect, the mixing behavior of the alloys can be well described. Within the homogeneity ranges of the intermetallic phases Pd_3Y and Pd_3Gd the activities of the unnoble components increase by more than ten orders of magnitude. (12 refs.)

119225 Thermodynamics of liquid Na-Sn alloys using CaF_2 solid electrolytes. R.Alqasmi, J.J.Egan (Brookhaven Nat. Lab., Upton, NY, USA).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.815-17 (Sept. 1983).
The thermodynamic properties of mixing for liquid Na-Sn alloys were determined between 750°C and 850°C by EMF measurements using a CaF_2 solid electrolyte. Concentrations were controlled by coulometric titration. Results are presented for partial and integral Gibbs energies, entropies, and heats of mixing across the entire composition range. (13 refs.)

119226 Enthalpy-concentration data for the systems carbon tetrachloride-xylene. J.Wisniak (Dept. of Chem. Engng., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Indian J. Technol., vol.21, no.3, p.105-8 (March 1983). [received: Oct. 1983]
Enthalpy-concentration data and boiling-point-composition correlations have been determined for the three binaries of xylene isomers with carbon tetrachloride at 760 mm Hg. This information should be useful for distillation studies. (8 refs.)

119227 Solid-state electrochemical study of (gallium+antimony) liquid alloys. T.J.Anderson, T.L.Aselage (Dept. of Chem. Engng., Univ. of Florida, Gainesville, FL, USA), L.F.Donaghey.
J. Chem. Thermodyn. (GB), vol.15, no.10, p.927-40 (Oct. 1983).
The activity of Ga in $\{x\mathrm{Ga}+(1-x)\mathrm{Sb}\}(1)$ alloys was measured in the high-temperature galvanic cells: $\mathrm{Pt}|\mathrm{C}|\mathrm{Ga}_x\mathrm{Sb}_{1-x}(1)$, β-$\mathrm{Ga_2O_3(cr)}|\mathrm{CSZ}|y_1\mathrm{CO}+y_2\mathrm{CO_2}+(1-y_1-y_2)\mathrm{Ar}|\mathrm{C}|\mathrm{Pt}$ and $\mathrm{Pt}|\mathrm{C}|\mathrm{Ga}_x\mathrm{Sb}_{1-x}(1)$, β-$\mathrm{Ga_2O_3(cr)}|\mathrm{CSZ}|\mathrm{Ga}(1)$, β-$\mathrm{Ga_2O_3(cr)}|\mathrm{C}|\mathrm{Pt}$, using calcia-stabilized zirconia (CSZ) as the solid electrolyte and either $\{y_1\mathrm{CO}+y_2\mathrm{CO_2}+(1-y_1-y_2)\mathrm{Ar}\}(g)$ or the two-phase $(\mathrm{Ga}+\beta\text{-}\mathrm{Ga_2O_3})$ as the reference electrode. Moderate deviations in activities from Raoult's law were found. The results of this study were found to be in excellent agreement with reported calorimetric results and liquidus temperatures. Several models were examined and the non-random two-liquid equation was found to represent best the activities reported in this work. (39 refs.)

119228 Effects of inhomogeneities in polyacrylamide gels on thermodynamic and transport properties. Tsong-Pin Hsu, Dong Sung Ma, C.Cohen (School of Chem. Engng., Cornell Univ., Ithaca, NY, USA).
Polymer (GB), vol.24, no.10, p.1273-8 (Oct. 1983).
The difference in swelling of polyacrylamide gels of various polymer concentrations and the nuclear magnetic resonance self-diffusion measurements of water in these gels suggest that inherent inhomogeneities in dilute gels play an important role in the thermodynamic and transport properties of these gels. (18 refs.)

119229 Some Monte Carlo calculations for the Lennard-Jones solid. E.R.Cowley (Dept. of Phys., Camden Coll. of Arts & Sci., Rutgers State Univ., Camden, NJ, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3160-3 (15 Sept. 1983).
Monte Carlo calculations of the thermodynamic and elastic properties of a classical nearest-neighbor Lennard-Jones solid have been carried out, for comparison with previous calculations using the cell-cluster method. The agreement between the results obtained by the two methods is very good. The dependence of the Monte Carlo results on sample size and on number of configurations was investigated. A simple correction for finite sample size is shown to be very accurate. (8 refs.)

119230 Problems in the thermodynamic description of real crystals. V.E.Panin, S.G.Psakh'e, A.I.Landa.
Sov. Phys. J. (USA), vol.25, no.12, p.1148-54 (Dec. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.12, p.95-102 (Dec. 1982). [received: Oct. 1983]
The authors consider the question of thermodynamic description of a real crystal with consideration of temperature effects and displacement of atoms from the ideal lattice points. (40 refs.)

119231 Investigation of thermodynamic behaviour of oxygen in copper bismuth melts at 1200°C. S.Anik, M.G.Frohberg, M.L.Kapoor (Inst. fur Metall., Tech. Univ. Berlin, Berlin, Germany).
Z. Phys. Chem., Wiesbaden (Germany), vol.133, no.2, p.167-74 (1982). In German. [received: Oct. 1983]
EMF measurements were performed by means of magnesia stabilized zirconia, in order to determine the thermodynamic behaviour of oxygen in molten Cu-Bi solvents at 1200°C. The free enthalpy of dissolution of the oxygen at infinite dilution as standard state is reported along with the interaction parameters after C. Wagner (1952). Various existing thermodynamic models are applied to interpret the experimental data. (13 refs.)

119232 Enthalpy of formation and transformation in binary and ternary systems of the metals iron, cobalt, nickel and molybdenum. O.Kubaschewski, T.Hoster (Rheinisch-Westfalischen Tech. Hochschule Aachen, Aachen, Germany).
Z. Metallkd. (Germany), vol.74, no.9, p.607-9 (Sept. 1983).
A simple high temperature calorimeter is used to measure the enthalpy of formation and transformation in the systems Fe-Mo, Ni-Mo, Co-Mo,Fe-Co-Mo, Ni-Co-Mo and Fe-Ni-Mo in the temperature range 800 to 1300 °C. (8 refs.)

119233 A contribution to the associate model for binary liquid alloys. U.Gerling, M.J.Pool, B.Predel (Max-Planck-Inst. fur Metallforschung Stuttgart, Stuttgart, Germany).
Z. Metallkd. (Germany), vol.74, no.9, p.616-19 (Sept. 1983).
After a brief survey over the development of the model of associates, five fundamentals of this theory are formulated. On the basis of these ideas the thermodynamic equations for a binary liquid solution with one kind of associates are established and explained. A method of calculation is given for the case of an approximated solution for the computation of the model parameters out of the thermodynamic data of a real binary system. (32 refs.)

65.70 THERMAL EXPANSION AND THERMOMECHANICAL EFFECTS

(see also 64.30 Equations of state; for electronic thermal conduction, see 72.15 and 72.20; for thermal conductivity of superconductors, see 74.30E; for pyroelectric and electrocaloric effects, see 77.70)

119234 Thermal expansivity of α-$LiIO_3$ between 20 and 520K. S.C.Abrahams, R.Liminga, P.Marsh, F.Schrey (Bell Labs., Murray Hill, NJ, USA), J.Albertsson, C.Svensson, A.Kvick.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.453-7 (1 Oct. 1983).
The lattice constants of hexagonal α-$LiIO_3$ have been measured both by single-crystal neutron and X-ray diffractometry and by dilatometry in the range 20 to 520K. The phase transition to γ-$LiIO_3$ takes place at about 520K. At 295K, $a=5.48127(6)$ and $c=5.17165(4)$ Å for λ(Cu $K\alpha_1$)=1.540598 Å. The expansion is nonlinear and is fitted by the third-order polynomial $a_i^T=a_i^{295}[1+\alpha_i\Delta T+\beta_i(\Delta T)^2+\gamma_i(\Delta T)^3]$ with $a_1=25.3(3)$, $\alpha_3=46.1(3)\times10^{-6}K^{-1}$, $\beta_1=23.0(8)$, $\beta_3=39(1)\times10^{-9}K^{-2}$, and $\gamma_1=-25(7)$, $\gamma_3=-47(9)\times10^{-12}K^{-3}$, with $\Delta T=T-295K$. The principal thermal expansion coefficients $\alpha_i^T=\alpha_i^{295}[1+A_i\Delta T+B_i(\Delta T)^2]$ increase monotonically with temperature, gradually approaching 32×10^{-6} K^{-1} for the *a* and $56\times10^{-6}K^{-1}$ for the *c* axis from values at 20K of 7.1 and $14.2\times10^{-6}K^{-1}$, respectively. (18 refs.)

119235 Thermal pressure and thermal expansion coefficients and thermodynamic values derived at 298.15K for binary mixtures of methylcyclohexane+linear alkanes. A.Griot, R.Philippe, J.-C.Merlin (Univ. de Lyon I, Villeurbanne, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.507-13 (June 1983). In French.
Thermal pressure coefficients (β_m) and expansion coefficients (α_m) were measured at 298.15K for binary mixtures of methylcyclohexane and n-alkane (n-hexane, n-octane, n-dodecane and n-hexadecane). Thermal pressure coefficients are measured using a direct method and expansion coefficients using a pycnometric method. The choice of methylcyclohexane is explained by the peculiarity of this molecule due to the presence of the methyl group on the ring. The experimental data are interpreted by Flory's theory using enthalpy of mixing (H^E). The difference between these data and theory are explained by the 'order-disorder' effect that is not integrated by the theory. Another interpretation is made using the excess values β^E, α^E and V^E obtained from the experimental mixing data. The V^E (obtained from ρ_m) are found to increase with the number of carbons of the alkane, while the values of β^E decrease as the length of the alkane increases. These results are explained by the creation of disorder by the methylcyclohexane in long chain molecules like n-dodecane and n-hexadecane. The excess values for expansion coefficients are all negative and this result is in agreement with conclusions on the free volume of mixtures. (28 refs.)

119236 Thermal expansion of organic conductors. A.Krause, H.W.Schafer, H.W.Helberg (Drittes Phys. Inst., Univ. Gottingen, Gottingen, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1429-32 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Thermal expansions are measured in three crystal directions ([010] (stack); ⊥[010] in (100); ⊥ (100); principal directions of the conductivity tensor) of the semiconducting salt methyltriphenylarsonium-$(TCNQ)_2$ using an optical interference technique. The maximum thermal expansion coefficient is found in the stack direction. The thermal expansion of the conductors TTF-TCNQ, $(TMTSF)_2(FSO_3)$, and $(Pe)_2(AsF_6)_{0.75}$ $(PF_6)_{0.35}$.O.85 CH_2Cl_2 is measured along the stack directions with the microwave cavity perturbation technique in the skin effect regime. Debye-temperatures for these directions are calculated. (7 refs.)

119237 Low temperature thermal expansion of soda-borate glasses. E.S.Pinango, S.Vieira, R.Villar (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Madrid, Spain).
Solid State Commun. (USA), vol.48, no.2, p.143-5 (Oct. 1983).
The thermal expansion of glassy $(B_2O_3)_{1-x}(Na_2O)_x$, for $x=0.06$, 0.16 and 0.25 has been measured in the temperature range $4K<T<20K$. The results are analysed in terms of a polynomial $\alpha=aT+bT^{+}+cT^5+dT^7$ and the values of the coefficients are discussed. The linear term *a* is small and positive in the three glasses. This yields a small and positive Gruneisen parameter for the two level systems. The cubic term is negative and is not affected by change in coordination, phonon dispersion being responsible for the fast increase in thermal expansion on increasing the temperature. (15 refs.)

119238 Thermal expansion and isothermal compressibility of thallium telluride. M.A.Aldzhanov, K.K.Mamedov, D.A.Guseinov, A.B.Abdullaev (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.540-1 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.937-8 (March 1983). [received: Oct. 1983]
The authors report a study of the thermal expansion coefficient (α) and of the isothermal compressibility (κ_t) of TlTe in the region of the second-order phase transition, and the results of a calculation of the specific heat at constant volume (C_v), Gruneisen parameter, and other characteristics of atomic vibrations from the values of α and κ_t obtained at temperatures 4.2-350K. 66.00 TRANSPORT PROPERTIES OF CONDENSED MATTER (NONELECTRONIC)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

119239 Study of the phenomena of saline diffusion in a solar pond without convection to control stability. M.C.de Andres, J.Doria (Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.182-7 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
An experimental prototype for the indoors simulation of a solar pond behavior has been developed. In this prototype the evolution of the physics parameters involved with the nonconvecting zone stability, such as temperature and density profiles, are controlled. The diffusion and Soret coefficients have been measured in this system at the working temperature interval of a real solar pond. (3 refs.)

119240 Isothermal transport properties in solutions of symmetrical tetra-alkylammonium bromides. L.A.Woolf (School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), H.Weingartner.
Faraday Symp. Chem. Soc. (GB), no.17, p.41-53 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Density, molar conductance, transference number, tracer diffusion (cation, anion, water) and mutual diffusion data are reported for aqueous solutions of the following symmetrical tetra-alkylammonium halides at 25°C up to 2 mol kg^{-1} concentration: Me_4NBr, Et_4NBr, n-Pr_4NBr and n-Bu_4NBr. These data were used to obtain information on the interactions between pairs of species c, a, w (cation, anion, water) using Hertz's velocity-correlation formalism. Within this formalism the transport coefficients are related to time integrals over velocity cross-correlation functions between the various interaction partners. Results obtained for solutions of tetra-alkylammonium salts differ characteristically from those reported for alkali halides and reflect structural features such as hydrophobic hydration, cation-cation and anion-anion interactions. (30 refs.)

119241 Diffusion coefficients of binary liquid mixtures using ultracentrifuge. T.M.Aminabhavi, E.S.Jayadevappa, B.R.Prasad (Dept. of Chem., Karnatak Univ., Dharwad, India).
Indian J. Chem. A, vol.22A, no.3, p.231-3 (March 1983). [received: Oct. 1983]
Mutual diffusion coefficients of five pairs of binary solvent mixtures have been measured using the recently developed ultracentrifuge technique, over a range of compositions at 25°C. These data, when compared with literature values obtained from different techniques, show reasonably good agreement. (20 refs.)

119242 A model for laser induced diffusion. E.Fogarassy, R.Stuck, M.Toulemonde, D.Salles, P.Siffert (Groupe de Phys. et Applications des Semi-conducteurs, Strasbourg, France).
J. Appl. Phys. (USA), vol.54, no.9, p.5059-63 (Sept. 1983).
A model for laser induced diffusion is proposed, assuming the melting of a Si surface under pulsed laser irradiation and the diffusion, in liquid phase, of a thin film deposited impurity. Depending on the thickness of the film, it results in a dopant distribution profile with a surface disordered layer induced either by segregation effects or precipitation of the dopant in excess of the solubility limit achieved by laser annealing. Experimental results obtained for a ruby laser irradiation of thin films of various dopants such as Sb, Ga, Bi, and In deposited on Si substrates are in good agreement with the model. (20 refs.)

119243 Washburn numbers. V. Relative solvent transport numbers for ion constituents in the dioxan+water and dimethylsuphoxide+water systems. D.Feakins, R.D.O'Neill, W.E.Waghorne (Dept. of Chem., Univ. Coll., Dublin, Ireland).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2289-98 (Oct. 1983).
For pt.IV see ibid., vol.78, p.143, 1982. Washburn numbers $w_w{}^\circ=(n_+)_w{}^\circ t_+-(n_-)_w{}^\circ t_-$ for the alkali-metal chlorides in the dioxan+water

system are reported. These and values previously determined for the dimethylsulphoxide (DMSO)+water system have been combined with the Erdey-Gruz numbers $\Sigma n_w{}^\circ=(n_+)_w{}^\circ+(n_-)_w{}^\circ$ for these systems, also determined, to give the relative solvent transport numbers n_w for alkali-metal and chloride ions. The variation of n_w with solvent composition in the range 0-40% (w/w) (x_2=0-0.09) of organic solvent shows quite different patterns for each solvent mixture. The main features can be explained on the basis that small concentrations of DMSO enhance the three-dimensional structure of water, whilst dioxan breaks it down at all concentrations; that the behaviour of the ions is influenced by changes in both the total dynamic solvation number and the degree of preferential solvation; and that the smaller ion-solvent complexes tend to carry the current preferentially. (11 refs.)

119244 Molar volumes and mobilities of some divalent transition-metal cations in dimethylformamide. W.Grzybkowski, M.Pilarczyk (Dept. of Phys. Chem., Tech. Univ. of Gdansk, Gdansk, Poland).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2319-31 (Oct. 1983).
The apparent molar volumes and molar conductivities are reported for the Mn^{II}, Co^{II}, Ni^{II} and Zn^{II} perchlorates in dimethylformamide solution at 25°C. The limiting molar conductivities and molar volumes of the cations are derived and discussed in terms of the nature of the solvated complexes existing in solutions that are responsible for charge transport due to the cations. (36 refs.)

119245 Model calculations on the electric conductivity of the N_c phase. P.J.Photinos, A.Saupe (Dept. of Phys., Kent State Univ., Kent, OH, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.91-7 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
A theoretical study of the electric conductivity of a system consisting of a body-centered tetragonal lattice of insulating cylinders, embedded in a uniform and isotropic conducting medium is presented. The model is described by three parameters: the volume fraction occupied by the cylinders (here taken to be less than 50%): the diameter to length ratio of the cylinders, d/l; and the ratio of the minimum distances between cylinders normal and parallel to the cylinder axis, ξ. The authors find that the conductivity anisotropy is in general smaller than the value corresponding to infinitely long cylinders. The anisotropy can assume both positive and negative values. The sign is largely determined by the ratio ξ. The usefulness of the model in relation to the N_c lyotropic mesophase is discussed. (6 refs.)

119246 Diffusion of spheres in a concentrated suspension: resummation of many-body hydrodynamic interactions. C.W.J.Beenakker, P.Mazur (Inst.-Lorentz, Rijksuniv. Leiden, Leiden, Netherlands).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.22-4 (3 Oct. 1983).
The authors evaluate the wavevector dependent (short-time) diffusions coefficient $D(k)$ for spherical particles in suspension. The analysis is valid up to high concentrations and fully takes into account the many-body hydrodynamic interactions between an arbitrary number of spheres. By resumming moreover a certain class of correlations, they obtain results which agree well with available experimental data for the small and large wavevector limits of $D(k)$. (7 refs.)

119247 Fat-simulating and accelerating solvents for polyolefins and MWD of solvent extracts of polyethylenes. Shu-Sing Chang, W.J.Pummer, J.R.Maurey (Polymer Sci. & Standards Div., NBS, Washington, DC, USA).
Polymer (GB), vol.24, no.10, p.1267-72 (Oct. 1983).
Migration kinetics of straight-chain oligomers and antioxidants from several polyolefins at different temperatures into various solvents have been studied by radioactive tracer techniques. Anhydrous ethanol appears to be a well suited food-oil or liquid-fat simulant for extracting different types of migrants from polyolefins. Pure and mixed triglycerides are also good oil or fat simulants, but the triglycerides offer no simpler analytical procedures than the use of oil or fat themselves. n-Octanol may also be considered as a reasonable oil or fat simulant; however, its action depends somewhat on the choice of migrants. The accelerating action of n-heptane over that of oil or simulants is quantitatively demonstrated. The accelerating effects are greater for migration systems with lower diffusion coefficients. The diffusion coefficients for migration into n-heptane are about 20 times greater than the diffusion coefficients into ethanol or oil for otherwise identical migration systems yielding diffusion coefficients of about 10^{-7} cm^2 s^{-1} into oil or ethanol. For systems yielding diffusion coefficients into oil or ethanol of about 10^{-12} cm^2 s^{-1}, the corresponding diffusion coefficients into n-heptane are about 1000 times greater. The molecular weight distributions (MWDs) of the n-heptane and ethanol extracts of polyolefins have been analysed. n-Heptane can not only accelerate the migration of the individual migrant but also remove oligomer species that are slightly soluble or present at low levels in the oil or simulant extracts. 66.20 DIFFUSIVE MOMENTUM TRANSPORT

(inc. viscosity of liquids)

119248 Isothermal transport of liquids through cellulose acetate membranes. J.I.Mengual, F.Garcia Lopez (Facultad de Fisica, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.121-7 (May-Aug. 1983). [received: Oct. 1983]
Isothermal permeation of methanol, ethanol and water through cellulose acetate membranes has been studied as a function of temperature in the 30-45°C range. Permeability increases with temperature in all cases. Experimental results are analysed in terms of three transport models. All the models lead to the conclusion that the transport mechanism is clearly viscous. The correlation between pore radius and liquid-membrane system is discussed. (16 refs.)

119249 Viscosity and longest relaxation time of semi-dilute polymer solutions. I. Good solvent. M.Adam, M.Delsanti (Lab. Leon Brillouin, CENS, Gif-sur-Yvette, France).
J. Phys. (France), vol.44, no.10, p.1185-93 (Oct. 1983).
The zero shear viscosity and longest relaxation time are measured for semi-dilute polystyrene benzene solutions. For monomer concentrations c smaller than 10% and over a large range of the reduced concentration c/c^* where c^* is the overlap concentration ($4<c/c^*<70$), the authors find that: both the relative viscosity η_r and the longest relaxation time T_R divided by the first mode characteristic time T_1 of a single chain are functions of the reduced concentration c/c^* only; the shear elastic modulus is independent of the molecular weight. (26 refs.)

119250 Shear viscosity in rapidly quenched states. M.Tanaka (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2970-2 (Sept. 1983).
The shear viscosity η is calculated in rapidly quenched states of a model of liquid rubidium by the molecular dynamics method. During the rapid-quenching process, η is proportional to kT/D (Stokes' law) down to about one third of the melting point T_m, while the proportionality does not hold at lower temperatures. The change of the slope of ln η vs. $1/T$ suggests a structural change from super-cooled liquid to a glassy state around $T_m/3$, which is consistent with the results of molecular dynamics calculations of the structure. The value of η is obtained as 0.58 cP just above T_m and reaches to 14.6 cP in the final quenched state around the liquid helium temperature.

119251 Effect of trace impurity levels on the viscosity of vitreous silica. P.P.Bihuniak, A.Calabrese, E.M.Erwin (Quartz & Chem. Products Dept., General Electric Co., Richmond Heights, OH, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.134-5 (Aug. 1983).
The transformation-range viscosity dependence of vitreous silica on Al_2O_3 (25 to 350 molar ppm) and alakali oxide (1.0 to 75 molar ppm) was investigated. Viscosity increased with the molar ratio Al_2O_3/alkali oxide up to $\approx$8 and was constant at higher ratios. (6 refs.)

119252 The effect of addition of suspension PVC and VC-VAc copolymers on the rheological properties of modified PVC plastisols. E.Makarewicz (Akad. Tech.-Rolnicza, Bydgoszcz, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.117-19 (April 1983). In Polish. [received: Oct. 1983]
The results of determination of some rheological properties of PVC plastisols have been presented. The effect of addition of PCW S-68 and a VC-VAc copolymer to plastisols based on PCW E-68P modified with the Kreolak resin on the changes in critical stress, viscosity and energy of activation of viscous flow has been investigated. Just prepared plastisols and plastisols after ageing have been tested. A mathematical treatment of the effect of time of ageing on the rheological properties of modified plastisols has been presented. The same treatment has been applied to plastisols containing the above mentioned additives of PCW S-68 and VC-VAc copolymer. (4 refs.)

119253 The effect of polymolecularity and branching on the dependence of the melt flow index on the limiting viscosity number. Z.Dobkowski (Instytut Chemii Przemyslowej, Warszawa, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.1, p.10-11 (Jan. 1983). In Polish. [received: Oct. 1983]
Based on the results of studies on bisphenol-A polycarbonates an empirical relationship between the melt flow index and limiting viscosity number, polymolecularity index and degree of branching of polymer has been presented and the coefficients of the regression equation calculated. This relationship can be used in the evaluation of the presence of branched macromolecules in the polymer. The molten-state viscosity of polymer increases with an increase in the polymolecularity index and in the content of branchings. (8 refs.)

66.30D Theory of diffusion and ionic conduction in solids

119254 Atomic transport via point defects in crystals. I. General kinetic theory of diffusion. A.D.Franklin, A.B.Lidiard (Theoretical Phys. Div., AERE, Harwell, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.405-31 (8 Oct. 1983).
Presents a general formulation of the kinetic theory of solid state diffusion applicable to systems showing small degrees of vacancy and interstitial disorder. These equations are solved in the linear approximation, specifically for steady state conditions. The results verify the correctness of the phenomenological equations provided by non-equilibrium thermodynamics including the Onsager reciprocal relation. This theory includes previous kinetic theories made for a variety of systems as special cases and shows how systematic improvements in accuracy can be made within this framework. The relations between this theory and alternative theories, those derived from the Einstein-Smoluchowski equation and from Kubo linear response theory, are briefly touched upon. (32 refs.)

119255 Analysis of the stoichiometry and temperature dependence of cation diffusion in wustite, $Fe_{1-\delta}O$. R.A.McKee (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3007-13 (15 Sept. 1983).
A generalized thermodynamic representation of diffusion in high-defect-concentration solids is reviewed. This formalism permits a description of diffusion phenomena (metal oxidation, ionic conductivity, thermomigration) in terms of equilibrium thermodynamic properties, the tracer diffusion coefficient, and the correlation factor. This phenomenological theory is then applied in an analysis of experimental data for chemical diffusion in $Fe_{1-\delta}O$. Moreover, the theory-experiment comparison allows the ΔK parameter associated with an isotope strength measurement to be determined. With values of ΔK, the corresponding correlation factor that is obtained from an isotope strength measurement can be evaluated. It is seen that the correlation factor for iron diffusion in $Fe_{1-\delta}O$ decreases with an increase in the deviation in stoichiometry and decreases with an increase in temperature. These phenomena are discussed in terms of defect structures that have been proposed for this material. (28 refs.)

119256 Correlation factors for atomic diffusion in nondilute multicomponent alloys with arbitrary vacancy concentration. R.A.Tahir-Kheli (Dept. of Phys., Temple Univ., Philadelphia, PA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3049-56 (15 Sept. 1983).
Vacancy-assisted tracer diffusion in a multicomponent kinetic alloy consisting of $x^{\lambda}N$ atoms with hopping rate J^{λ} (where $\lambda \equiv A,B,C$, etc.) and νN vacancies (where $\nu = 1 - \Sigma_{\lambda} x^{\lambda}$) distributed randomly over a regular d-dimensional (where $d \geq 2$) hypercubic, or close-packed, lattice of N sites is analyzed through a self-consistent renormalization of a recent theory of Tahir-Kheli and Elliott combined with a generalization of concepts introduced by Manning. The result for the tracer-diffusion correlation factor is the following: $f^{tr} = H''(tr)/[H''(tr) + 2J^0]$, where J^0 is the tracer-hopping rate, $H''(tr)$ is a generalized effective vacancy escape frequency, $H''(tr) = M/(1-\nu)[J^0 \nu f^{tr} + J^{eff}]$, where J^{eff} is an effective hopping rate of the background atoms averaged with a weighting factor proportional to x^{λ} and f^{λ}, i.e. $J^{eff} = \Sigma_{\lambda}(J^{\lambda} x^{\lambda} f^{\lambda})/\Sigma_{\lambda}(x^{\lambda} f^{\lambda})$ and $M = -(1 + \langle \cos\theta \rangle)/\langle \cos\theta \rangle$. For a single-component alloy, with particle concentration x, $J^{\lambda} = J$, and vacancy concentration $\nu = 1 - x$, the author's theory provides an excellent overall description of the correlation factor as long as $J/J^0 \gtrsim z^{-2}$. Indeed, even for $J \rightarrow O$, the calculated results agree with the Monte Carlo estimates, except in the immediate vicinity of the percolation threshold, ν_p, which is located self-consistently to an accuracy of the order $1/z$. 66.30H Self-diffusion and ionic conduction in nonmetals

119257 Proton conductivity in the layer compound $H_3OUO_2AsO_4.3H_2O$ (HUAs). I. Conductivity in the orthorhombic low-temperature phase and the vehicle mechanism of proton transport in solids. K.D.Kreuer, A.Rabenau (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany), R.Messer.
Appl. Phys. A (Germany), vol.A32, no.2, p.45-53 (Oct. 1983).
The proton conductivity in $H_3OUO_2AsO_4.3H_2O$ (HUAs) has been measured below the transition temperature at 299K. A consistent picture of the elementary process taking place is developed from separate electrochemical, spectroscopic and calorimetric measurements. The conductivity is proposed to occur by the 'vehicle mechanism' of proton transport, i.e. the cooperative motion of H_3O^+ and H_2O. This mechanism is compared with the Grotthuss and the simple ion hopping mechanism. (58 refs.)

119258 Diffusion mobility of anions in fluorides of the elpasolite structure. V.A.Vopilov, V.N.Voronov, V.M.Buznik (L.V. Kirenskii Phys. Inst., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1628-31 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1893-5 (Nov. 1982).
Samples in the systems $2KF\text{-}AF\text{-}BiF_3$ (where A is Na, K, and Rb) have been synthesized and the ^{19}F NMR studied. Intense diffusional motion of the fluorine anions was observed at temperatures significantly below the melting temperatures of the crystals studied. The magnitudes of the activation energies for diffusional motion of the fluorine ions were estimated. (10 refs.)

119259 Dynamic bond percolation theory: A microscopic model for diffusion in dynamically disordered systems. I. Definition and one-dimensional case. S.D.Druger, A.Nitzan, M.A.Ratner (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3133-42 (15 Sept. 1983).
A dynamic bond percolation model is defined and studied. The model is intended to describe diffusion of small particles (ions, electrons) in a medium which is statistically disordered (as in ordinary bond percolation), but which is also undergoing dynamic rearrangement processes on a timescale short compared to the observation time. The model should be applicable to polymeric solid electrolytes, where the orientational motions of the polymer (which are responsible for configurational entropy) cause the dynamic motion of the medium (polymer) in which the small particles (alkali ions) diffuse. The model is characterized by three parameters: an average hopping rate w which appears in the master equation for hopping, a percentage of available bonds f, and a mean renewal time $\bar{\tau}_{ren}$ for dynamic motion of the medium to rearrange the assignments of closed and open bonds. The authors show that the behavior is always diffusive for observation times long compared to $\bar{\tau}_{ren}$, in agreement with experiment on polymeric solid electrolytes. They also derive a closed-form expression for the diffusion coefficient. For observation times smaller than the renewal time there is no diffusion, again in accord with the behavior of polymeric solid electrolytes below the glass transition temperature. The diffusion coefficient is a monotonically increasing function of the inverse renewal time and hence of the free volume, the configurational entropy, and the temperature. (20 refs.)

119260 Electrical conductivity of $Sc_2O_3\text{-}ZrO_2$ compositions by 4-probe DC and 2-probe complex impedance techniques. S.P.S.Badwal (Div. of Materials Sci., CSIRO, Melbourne, Victoria, Australia).
J. Mater. Sci. (GB), vol.18, no.10, p.3117-27 (Oct. 1983).
The ionic conductivities of several samples in the $Sc_2O_3\text{-}ZrO_2$ system (Sc_2O_3:~8 mol.%) have been measured using 4-probe DC and 2-probe complex impedance dispersion techniques. Samples which contained monoclinic zirconia showed hysteresis effects and S-shaped Arrhenius conductivity plots. This behaviour was assigned to the $m\text{-}ZrO_2 \rightleftharpoons t\text{-}ZrO_2$ transformation. In samples which were free of monoclinic ZrO_2, contributions from the grain boundary resistance were relatively small. The Arrhenius plots of their conductivity showed a distinct change in the slope around 600°C towards higher activation energy and this was attributed to vacancy trapping. The 4-probe DC data could be fitted to an equation of the form $\rho = A_1 T \exp(E_1/RT) + A_2 T \exp(E_2/RT)$. The process which dominated the conduction mechanism at lower temperatures had an activation energy of 130 to 140 kJ mol^{-1}. The activation energy for the migration of oxygen ion vacancies within the bulk of the grain was 64 to 70 kJ mol^{-1}. (25 refs.)

119261 Change of conduction mechanism with gamma dose of irradiated borosilicate glasses containing copper ions. A.Tawansi, H.Dowediar (Dept. of Phys., Mansoura Univ. Mansoura, Egypt), M.M.Morsi, S.A.Khairy.
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.961-6 (1983).
The DC electrical resistivity of sodium borosilicate glasses containing copper ions has been measured at the temperature range 300-623K before and after gamma irradiation. The results obtained indicate that conduction may proceed ionically for the unirradiated glasses, with an activation energy in the range 23-24.2 Kcal/mol. Relatively low gamma doses (3.6 Mrads) induce two regions, separated at a critical temperature (T_c), of different activation energies. An activation energy E_1, 3.4 Kcal/mol, in the temperature range from 300-370K, and E_2 16.8-20.9 Kcal/mol, in the range of higher temperatures. The mechanism suggested is that the ionic conduction is replaced by an electronic one up to about 370K then seems to be replaced at higher temperature region by ionic-like mechanism which can be expressed by exciton-like process. High gamma doses (28.33 M rads) cause the glasses to have activation energy ranges between 19.9-22.7 Kcal/mol, which may substantiate the predominance of the proposed ionic-like mechanism. The transition region around T_c seems to be divided into three regions, precritical, critical and post-critical. (25 refs.)

119262 Effect of surface condition on oxygen self-diffusion coefficients for single-crystal Al_2O_3. Y.Oishi, K.Ando, N.Suga (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan), W.D.Kingery.
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.130-1 (Aug. 1983).
Oxygen self-diffusion coefficients were determined for two Al_2O_3 single crystals by the isotope-exchange technique, using chemically polished and Ar-ion-milled samples. Results represented by $D = 562 \exp[-665(kJ/mol)/RT]$ cm^2/s are lower than those for diamond-paste-finished samples and near Reed and Wuensch's results (see ibid., vol.63, p.88-92, 1980). The oxygen diffusion coefficient determined using crushed particles and the microscopically measured ratio of surface area to volume agreed with these values. (8 refs.)

119263 Effect of ratio of surface area to volume on oxygen self-diffusion coefficients determined for crushed $MgO\text{-}Al_2O_3$ spinels. K.Ando, Y.Oishi (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.131-2 (Aug. 1983).
Oxygen self-diffusion coefficients for single-crystal $MgO\text{-}Al_2O_3$ spinels previously determined for crushed particles were recalculated using the microscopic surface area of the sample, as was done for alumina. The corrected results agree well with those of Reddy and Cooper (see ibid., vol.64, p.368-71, 1981). (5 refs.)

119264 Enhanced oxygen diffusion at 1400°C in deformed single-crystal magnesium oxide. A.F.Henriksen, Y.-M.Chiang, W.D.Kingery (MIT, Cambridge, MA, USA), W.T.Petuskey.
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.144-6 (Aug. 1983).
The rate of oxygen diffusion at 1400°C into pure, deformed, and scandium-doped MgO was measured using a secondary-ion mass spectrometer with $^{16}O^-$ primary ions as sputtering agents to monitor the penetration of ^{18}O into the sample from an ^{18}O-enriched surface layer. In samples doped with scandium, oxygen diffusivity did not differ significantly from the value, 1.3×10^{-15} cm^2/s, found for the pure sample. In deformed samples, the diffusion coefficient was 5.8×10^{-15} cm^2/s. (14 refs.)

119265 Self-diffusion in gallium arsenide. H.D.Palfrey, M.Brown, A.F.W.Willoughby (Southampton Univ., Southampton, England).
J. Electron. Mater. (USA), vol.12, no.5, p.863-77 (Sept. 1983).
The self-diffusion of arsenic in gallium arsenide has been studied over the temperature range 1000 to 1075°C using radiotracer techniques. ^{76}As was diffused into GaAs samples at known arsenic pressures in sealed capsules. After diffusion, layers were removed from the surface using anodic oxidation followed by oxide dissolution. Diffusion profiles were obtained by measuring the ^{76}As concentration in each sectioned layer by γ-radiation counting. Results are discussed in terms of native point defect equilibria with the arsenic gaseous phase, and with respect to other work. It is deduced from the observed arsenic pressure dependence of the arsenic diffusivity that the most likely diffusion mechanism for As is via vacancies on its own sublattice. (16 refs.)

119266 Diffusion of fluorine ions in yttrium iron garnet. B.Antonini, P.Paroli (Istituto di Elettronica dello Stato Solido, CNR, Roma, Italy).
Phys. Rev. B (USA), vol.28, no.6, p.3422-6 (15 Sept. 1983).
The diffusion of F^- ions in yttrium iron garnet has been induced for the first time and investigated by magneto-optical techniques. Crystals of composition $Y_{3-x}Ca_xFe_5O_{12-x}F_x$ (with $x \approx 0.3$) were grown, and diffusion of F^- ions out of the sample was induced by high-temperature annealing in oxygen. The replacement of F^- with O^{2-} ions induces Fe^{4+} ions, whose magnetic circular dichroism in the near-infrared is used as a sensitive monitor of the diffusion process. This phenomenon can be well described in terms of the classical diffusion equation with a diffusion coefficient D uniform and constant, temperature activated according to the law $DK = D_0 \exp(-E/kT)$, with $D_0 = 6.5 \pm 1.0$ cm^2 s^{-1} and $E = 3.42 \pm 0.15$ eV. These values might indicate that microscopically the F^-, O^{2-} ion exchange occurs with the intervention of an anion vacancy. (17 refs.)

119267 Effect of inertial forces on ionic transport in superionic conductors. N.N.Vershinin, Yu.I.Malov, E.A.Ukse (Inst. of New Chem. Problems, Acad. of Sci., Moscow, USSR).
Sov. Electrochem. (USA), vol.19, no.1, p.92-3 (Jan. 1983). Translation of: *Elektrokhimiya (USSR)*, vol.19, no.1, p.102-3 (Jan. 1983). [received: Sept. 1983]
One can assume in order to explain the high conductivity of superionic conductors that the mobile ions are in a relatively free state, i.e. that they are weakly bound to particular crystallographic positions, and participate in continuous motion along channels of the more or less rigid crystal structure. This model admits of a certain analogy between the mobile ions in superionic conductors and the 'free' electrons in metals. The direct proof for 'free' electrons being the charge carriers in metals had been obtained in experiments of Tolman (1976), who measured the electric current generated in a metal when this was subjected to acceleration and the 'free' electrons were lagging relative to the motion of the metal's rigid crystal lattice. The authors have studied the effect of inertial (centrifugal) force on ionic transport in superionic conductors. (4 refs.)

66.30J Diffusion, migration, and displacement of impurities

119268 Thermodynamic behavior of impurity atoms in α-range alloys of the noble metals and nickel. T.Hehenkamp (Inst. fur Metallphys., Univ. Gottingen, Gottingen, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.806-11 (Sept. 1983).
Thermodynamic data for dilute α-range alloys are necessary to understand atomic migration. Such data, however, are very scarce in the literature and contradict each other in many cases. A comparison is presented between the results of different experimental techniques particularly designed to measure partial thermodynamic quantities at low impurity concentrations. The results for 1-B-noble metal alloys are surprisingly uniform and indicate an electronic origin of the dependence of the excess potentials on concentration, if the impurity atom has the same ion core as the host metal. If the impurity atom exhibits a much different ion core, a minimum in the excess chemical potential becomes observable at low concentrations. The reason could be either a size misfit or a dependence of the excess functions on the atomic mass. The viewpoint of the mass dependence is corroborated by results in the Ag-As system, which is characterized by almost no size misfit but a different atomic mass, and some recent measurements in nickel alloys. (33 refs.)

119269 Permeation, diffusion, and solution of hydrogen isotopes, methane, and inert gases in/through tetrafluoroethylene and polyethylene. H.Miyake, M.Matsuyama, K.Ashida, K.Watanabe (Tritium Res. Center, Toyama Univ., Toyama, Japan).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1447-51 (1983).
Permeation of three hydrogen isotopes, methane, and inert gases were measured for a tetrafluoroethylene (TFE) and a polyethylene (PE) film at room temperature by means of the time-lag method in order to establish physicochemical properties which determine the solubility and the diffusivity of these gases. It was observed that the diffusion constant of the inert gases changed exponentially with the heat of vaporization, and their solubility constant was an exponential function of the Lennard-Jones force constant of the gases for both films. On the other hand, hydrogen isotopes and methane deviated from these relations. It is concluded that the dispersive force plays an important role for the solution and the diffusion of the inert gases, whereas chemical interactions between the solute and the solvent play an important role. (14 refs.)

119270 Diffusion of gold and mercury self-diffusion in *n*-type Bridgman-grown $Hg_{1-x}Cd_xTe(x\simeq0.2)$. M.Brown, A.F.W.Willoughby (Engng. Materials Lab., Univ. of Southampton, Southampton, England).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1641-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The diffusion behavior of mercury in $Hg_{0.8}Cd_{0.2}Te$ was investigated using radiotracer techniques. Complex concentration versus distance profiles resulted from both the gold and mercury diffusion anneals. At 225°C, complementary error function curve fits to the surface and tail components of the mercury diffusion profile yielded diffusion coefficients of $\simeq 8\times10^{-14}$ and $\simeq 2.5\times10^{-11}$ $cm^2\ s^{-1}$ for the surface and tail regions, respectively. Mercury diffusion coefficients were similar for as-grown and mercury preannealed samples. Surface concentrations were unknown for the gold diffusion profiles and accurate diffusion coefficient calculations were not made, but the migration rate of gold appeared faster than mercury in $Hg_{0.8}Cd_{0.2}Te$. A mechanism was proposed for depletion of gold in the near-surface region of the HgCdTe for long diffusion times in a mercury ambient, which involved the formation of Au/Hg compounds at the slice surface. (8 refs.)

119271 Oxidation enhanced and concentration dependent diffusions of dopants in silicon. S.Matsumoto, Y.Ishikawa (Dept. of Electrical Engng., Keio Univ., Yokohama, Japan), T.Niimi.
J. Appl. Phys. (USA), vol.54, no.9, p.5049-54 (Sept. 1983).
Diffusions of impurities in silicon under oxidizing ambient and under extrinsic conditions have been analyzed by developing the Hu's model. The general expression of diffusion coefficient, which includes both the vacancy and interstitial mechanisms, is used. The temperature dependences of a fraction of the interstitial mechanism for arsenic f_{As}, phosphorus f_P, and boron f_B are obtained from the data of oxidation enhanced diffusion (OED) and oxidation induced stacking faults. $f_{As}=42\exp(-0.542/kT)$, $f_P=156\exp(-0.666/kT)$, and $f_B=860\exp(-0.829/kT)$. Time dependence of OED and the concentration dependence of the diffusion coefficient of arsenic and boron under extrinsic conditions can be explained by this model. (49 refs.)

119272 Examination of models for Zn diffusion in GaAs. A.H.van Ommen (Philips Res. Labs., Eindhoven, Netherlands).
J. Appl. Phys. (USA), vol.54, no.9, p.5055-8 (Sept. 1983).
Concentration profiles of Zn in GaAs have been calculated for two models: the Frank-Turnbull model involving Schottky defects and the 'kick-out' model involving gallium Frenkel defects. Comparison with experimental data shows that the latter model gives a better description. This indicates that Frenkel defects play a predominant role in this diffusion process. (14 refs.)

119273 n-type doping of $(CH)_x$: molecular diffusion of the dopant. F.Rachdi, P.Bernier, E.Faulques, S.Lefrant, F.Schue (Groupe de Dynamique des Phases Condensees, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.97-100 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Studies the kinetics of the n-type doping of cis-$(CH)_x$ films using lithium-benzophenone solutions in THF. Raman spectroscopy shows that cis-trans isomerization occurs during the doping process. By following the evolution of the ESR spectra, the authors were able to deduce both the interfibrillar and the intrafibrillar diffusion coefficients. (8 refs.)

119274 The diffusivity of hydrogen in Nb stabilized stainless steel. R.A.Outlaw (NASA, Langley Res. Center, Hampton, VA, USA), D.T.Peterson.
Metall. Trans. A (USA), vol.14A, no.9, p.1869-73 (Sept. 1983).
The evolution of hydrogen from 347 stainless steel has been studied by using a real time dynamic technique under ultrahigh vacuum conditions. Auger electron spectroscopy was used to determine the surface composition as a function of time and temperature. The surface film on the electropolished samples was found to be approximately 15 Å thick and consisted of a carbon-oxygen complex and a metal oxide (Fe_xO_y). Upon heating to 400°C, the carbon-oxygen complex desorbed as CO and the remaining oxygen and carbon began to incorporate. Also at this temperature sulfur began to diffuse out of the bulk to the surface and at approximately 800°C formed a complete monolayer. At 900°C, carbon and oxygen virtually disappeared, leaving the monolayer of sulfur as the only surface contaminant. The hydrogen diffusivity was found to follow closely the equation $D=7.01\times10^{-7}\exp[-48.0/RT]$ m^2 per second over the entire temperature range studied, thus indicating that hydrogen evolution is not significantly affected by the changing surface composition. (7 refs.)

119275 Diffusion of water in NaCl bicrystals. L.B.Harris, S.L.Bewlay (Dept. of Appl. Phys., Univ. of New South Wales, Kensington, New South Wales, Australia).
Phys. Status Solidi a (Germany), vol.79, no.1, p.243-50 (Sept. 1983).
Measurement of the variation in the light scattered from precipitates produced by moisture diffusing along a grain boundary is developed into a method for determining the grain boundary diffusion coefficient D of the water. Suitable treatment of data from nominally pure bicrystals enables an approximate value for D at room temperature to be obtained by two independent methods. (19 refs.)

119276 Resonant dependence of molecular diffusion through a fine-pore filter on the IR-illumination intensity. V.A.Kravchenko, Yu.N.Petrov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.573-4 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1330-2 (Nov. 1982). [received: Sept. 1983]
The authors report a study of how the intensity of an illuminating laser beam affects the flux density of resonant molecules through a fine-pore filter. In the experiments they use a CO laser system built around an ILGN-704 industrial laser. The filter is a mica wafer 1 cm in diameter and 40 μm thick, with a pore size $\sim$50 Å. The authors studied the diffusion of toluene molecules, which have absorption lines in the spectral region corresponding to the output of the CO laser. The flux density of molecules is measured with a KM-2 quadrupole mass spectrometer. (3 refs.)

119277 Ion migration activation energy measurements in silicon dioxide. D.Schipanski (Tech. Hochschule Ilmenau, Ilmenau, Germany).
Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.145-52 (1983). In German.
The trapping or gettering of contaminating ions in materials used for semiconductor processing is studied, using thermally induced ion currents (TSIC) between 20 deg C and 350 deg C, where a drift field of 10^5 volts per cem was applied. The concentration of ion traps is calculated and temperature ion current spectra for Al-SiO_2(HCl)-Si samples are reproduced. It is stated that activation energies can be determined to a resolution of 0.1 eV. (9 refs.)

119278 Influence of defects on the diffusion of helium in calcium fluoride. E.V.Popov, A.Ya.Kupryazhkin, I.R.Shein (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.521-2 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.906-8 (March 1983). [received: Oct. 1983]
The authors have eliminated the influence of radiation defects on diffusion transport of He^4 in CaF_2 by desorption in a two-cell diffusion chamber in which samples were saturated separately in one of the cells at the measurement temperature under a helium pressure of $\sim$3 atm for a period $t>3\tau$, where τ is the relaxation time of the diffusion process; this was followed by a determination (after transfer to another cell in vacuum) of outgassing of the crystals. The diffusion of He^4 in CaF_2 was studied in the temperature range 773-1363K. The temperature dependence of the diffusion coefficient of helium in the investigated samples had a kink at about 930K. 119279 Interaction of thin layers of Al and Ge with cleaved (Hg,Cd)Te surfaces. G.D.Davis, N.E.Byer (Martin Marietta Labs., Baltimore, MD, USA), R.R.Daniels, G.Margaritondo.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1726-9 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The interaction of $Hg_{0.72}Cd_{0.28}Te$ substrates with submonolayer-deposited films of Al and Ge has been investigated by ultraviolet photoelectron spectroscopy (UPS) using a synchrotron radiation source. The surfaces of the *p*-type samples were formed by cleaving in ultrahigh vacuum—a process which resulted in *n*-type surfaces. Very thin layers of Al(0.2-1 Å) were found to interact very strongly with the surface, causing a dramatic loss in the amount of Hg at the surface and a much smaller loss of Cd. As a result, the measured Cd/Hg concentration ratio increased by more than a factor of 2 for 1 Å of Al. At the same time, the valence-band features shifted downwards in energy, reflecting an apparent change in the local band gap. In contrast, Ge was relatively inert with regard to the cleaved surface and caused little

change in the substrate composition. The behavior of both deposited films can be predicted from the decreasing thermodynamic stability of Al_2Te_3, CdTe, HgTe, and GeTe and may be important to the formation of good Ohmic contacts. (18 refs.)

119280 Kinetics of $TiSi_2$ formation by thin Ti films on Si. L.S.Hung, J.Gyulai, J.W.Mayer (Cornell Univ., Ithaca, NY, USA), S.S.Lau, M.-A.Nicolet.
J. Appl. Phys. (USA), vol.54, no.9, p.5076-80 (Sept. 1983).
Silicide formation with Ti deposited on single crystal Si and Ti deposited on amorphous Si layers sequentially without breaking the vacuum was investigated using backscattering spectrometry and glancing-angle X-ray diffraction. For Ti deposited on amorphous Si, $TiSi_2$ was formed with a rate proportional to $(time)^{1/2}$ and an activation energy of 1.8 ± 0.1 eV. For Ti deposited on single crystal Si, the reaction rate was slower and the silicide layer was nonuniform in thickness. The authors attribute the difference in behavior to the presences of interfacial impurities in the case where Ti was deposited on single crystal Si. (19 refs.)

119281 Influence of boron on chemical interdiffusion in SiC during conversion of silicon fibers to SiC. K.M.Friederich (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany), R.L.Coble.
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.141-2 (Aug. 1983).
The influence of boron additions on the diffusivities of Si and C in SiC was studied by modifying an experiment described by Kato and Okabe (see ibid., vol.63, p.236, 1980). The diffusivities of both species are considerably enhanced by adding as little as 10 ppb boron. A method to investigate the transport mechanisms in SiC is provided by this modified experiment. (8 refs.)

119282 An analysis of concentration profiles for fluxes, diffusion depths, and zero-flux planes in multicomponent diffusion. M.A.Dayananda (Purdue Univ., West Lafayette, IN, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1851-8 (Sept. 1983).
Concentration profiles developed during isothermal, multicomponent diffusion for a single-phase, solid-solid diffusion couple are expressed on the basis of a relative concentration variable for each component and analyzed for the determination of interdiffusion fluxes. The individual concentration profiles intersect at a common cross-over composition where the relative concentrations of all components are identical. New relations are developed for describing internal consistency among the concentration profiles of the various components. A link is made between the cross-over composition and the depths of the diffusion zone on either side of the Matano plane for a diffusion couple. The identification of a zero-flux plane from concentration profiles is also described. A single phase Cu-Ni-Zn diffusion couple annealed at 775°C is used for illustration. (33 refs.)

66.30Q Electromigration

119283 Electric field enhanced diffusion in polyacetylene. J.H.Kaufman (Inst. for Polymers & Organic Solids, Univ. of California, Santa Barbara, CA, USA), A.J.Heeger, R.Kaner, E.J.Mele, A.G.MacDiarmid.
J. Phys. Colloq. (France), vol.44, no.C-3, p.577-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A theory is developed which shows how high power and current densities can be generated by a $(CH)_x$ battery cell despite the slow diffusion and low conductivity characteristic of ionic motion in polyacetylene. The presence of a small driving potential (or a load) causes current to flow and generates a large electric field in the fibrils when the electronic screening length is of the order of a fibril radius. This field dramatically increases the ion transport rate. (7 refs.)

119284 Measured thermal diffusivity of $Hg_{1-x}Cd_xTe$ solids and melts. L.R.Holland (NASA/Space Sci. Lab., Marshall Space Flight Center, AL, USA), R.E.Taylor.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1615-19 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The thermal diffusivity of $Hg_{1-x}Cd_xTe$ melts is found to rise rapidly with temperature to values characteristic of metals. Solid and melt diffusivities for values of x from 0 to 0.3 and over a temperature range from 150 to 900°C have been determined by the laser flash method of Parker, Taylor, and Cowan. The diffusivity decreases from a maximum at $x=0$ in both the solid and the liquid, with the values observed at $x=0.3$ being about 40% of those for $x=0$. The solid diffusivity for $x=0$ is 1.7 mm^2/s at 150°C decreasing to 0.7 mm^2/s at the melting point. The $x=0$ liquid diffusivity increases from 0.7 mm^2/s at the melting point to 3.5 mm^2/s at 900°C. (16 refs.)

119285 Thermal conductivity of lead sulfide-based solid solutions. K.Sh.Kakhramanov, S.A.Aliev (Phys. Inst., Acad. of Sci., Azerbaidzhan SSR).
Inorg. Mater. (USA), vol.18, no.10, p.1460-4 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1700-4 (Oct. 1982). [received: Sept. 1983]
Thermal conductivities were studied in the quasibinary and quasiternary systems PbS-PbSe, PbS-PbTe, PbS-Sb, and PbS-PbSe-PbTe. Electron and lattice contributions to the thermal conductivity were calculated bearing in mind the nonparabolic conduction band. At $T \geq 300K$ all the lead sulfide based solid solutions were found to be affected by disordering and normal processes of phonon scattering in a comparable manner to Umklapp processes. Here, the main contribution to additional thermal resistance in PbS-PbTe, PbS-Sb, and PbS-PbSe-PbTe systems was a result of local elasticity changes. (14 refs.)

119286 Thermal properties of doped and undoped $(CH)_x$. G.Leising, H.Kahlert (Inst. fur Festkorperphys., Tech. Univ. Graz, Graz, Austria).
J. Phys. Colloq. (France), vol.44, no.C-3, p.111-14 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Measurements of the thermal conductivity of undoped cis-$(CH)_x$ and trans-$(CH)_x$ and of iodine-doped cis-$(CH)_x$ in the temperature range between 60K and 300K are reported and compared to the results of other authors. Adopting a very simple morphological model the authors estimate from their data the thermal conductivity of individual $(CH)_x$-fibres. In addition, values for the specific heat of cis- and trans-$(CH)_x$ are determined and the activation energy for the cis-trans-isomerization is obtained for differential-scanning-calorimetry experiments. (9 refs.)

119287 Lattice thermal conductivity of crystals with dislocations. M.A.Ansari, A.Kumar, B.K.Srivastava (Dept. of Phys. & Meteorology, Indian Inst. of Technol., Kharagpur, India).
Phys. Status Solidi b (Germany), vol.119, no.1, p.113-19 (1 Sept. 1983).
The thermal conductivity of crystals containing dislocations is calculated using Kubo's relation. The correlation function is obtained using the projection operators are suggested by Wilson and Kim (1973). It is observed that the phonon scattering by the strain field due to the dislocations is proportional to the phonon frequency and is anisotropic is nature. (12 refs.)

119288 Thermal conductivity of crystals: a molecular-dynamics study of heat flow in a two-dimensional crystal. R.D.Mountain, R.A.MacDonald (Thermophys. Div., NBS, Washington, DC, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3022-5 (15 Sept. 1983).
The authors have studied steady-state heat flow in a two-dimensional crystal by the method of molecular dynamics. The model system contains 1000 particles on a triangular lattice interacting via the Lennard-Jones potential. The system is 50 unit cells long and 10 unit cells wide. They find that the thermal conductivity κ of this system is consistent with $1/T$ behavior as expected when phonon-phonon scattering is the dominant mechanism for thermal resistance. They have also carried out similar calculations for three-dimensional Lennard-Jones systems in both fluid and crystalline configurations. The results for the fluid were in good agreement with earlier calculations but for the FCC solid system, 16 unit cells in length, κ was independent of temperature. They determined that boundary scattering was the dominant resistive mechanism in this case. To escape the boundary-limited regime, the length of the three-dimensional crystal needs to be increased by at least a factor of 3. It is feasible to simulate a system of this size with the use of modern computers. (22 refs.)

119289 Thermal conductivity of an imperfect anharmonic crystal. D.N.Sahu, P.K.Sharma (Phys. Dept., Univ. of Allahabad, Allahabad, India).
Phys. Rev. B (USA), vol.28, no.6, p.3200-13 (15 Sept. 1983).
The thermal conductivity of an anharmonic crystal containing randomly distributed substitutional defects due to impurity-phonon scattering is theoretically investigated with the use of the method of double-time thermal Green's functions and the Kubo formalism considering all the terms, i.e. diagonal, nondiagonal, cubic anharmonic, and imperfection terms in the energy-flux operator as propounded by Hardy (1963-6). The study uses cubic, quartic anharmonic, and defect terms in the Hamiltonian. Mass changes as well as force-constant changes between impurity and host-lattice atoms are taken into account explicitly. It is shown that the total conductivity can be written as a sum of contributions, namely diagonal, nondiagonal, anharmonic, and imperfection contributions. For phonons of small halfwidth, the diagonal contribution has precisely the same form which is obtained from Boltzmann's transport equation for impurity scattering in the relaxation-time approximation. The present study shows that there is a finite contribution of the nondiagonal term, cubic anharmonic term, and the term due to lattice imperfections in the energy-flux operator to the thermal conductivity although the contribution is small compared with that from the diagonal part. The authors have also discussed the feasibility of numerical evaluation of the various contributions to the thermal conductivity. (23 refs.)

67.00 QUANTUM FLUIDS AND SOLIDS; LIQUID AND SOLID HELIUM

(see also 05.30 Quantum statistical mechanics)

67.40 BOSON DEGENERACY AND SUPERFLUIDITY OF HELIUM-4

119290 Measurement of the transient heat transfer to liquid helium from a thin metal film. B.A.Danil'chenko, V.N.Poroshin (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Cryogenics (GB), vol.23, no.10, p.546-8 (Oct. 1983).
A method to measure transient heat transfer to liquid helium from a thin metal film heater under the condition of pulsed heating during $\tau \leq 400$ ns is proposed. The experimental equipment used for the measurements is described. The method is based on the comparison of heat pulses transfered from the heater into a monocrystal substrate which is surrounded either by vacuum or by liquid helium. The method can also be used to investigate the heat flux density transmitted into liquid helium over a wide region of thermal loads. Experimental results showing the heat flux density radiated from a Cu heater into liquid helium at 3.8K as a function of the electric power fed into the heater by pulses of 200-400 ns duration are demonstrated. (8 refs.)

119291 Influence of three-body correlations in the spectrum of elementary excitations in liquid ^4He. S.Kilic (Fakultet Gradevinskih Znanosti, Split, Yugoslavia).
Fizika (Yugoslavia), vol.15, no.3, p.263-72 (July-Sept. 1983).
Using the variational ansatz the author obtained an appropriate expression for the energy of elementary excitations. Reduction to the Jackson-Feenberg form and the numerical computation pointed out the necessity for precision in the perturbation calculation. He also analysed the influence of three-body correlation on the Jackson-Feenberg spectrum in the convolution approximation. Consequently he used and tested in this way the Feenberg as well as Woo form of the three-body correlation part of the wave function. It was demonstrated that the influence of Feenberg's three-body correlations on convolution approximation is actually insignificant. The same is correct for Woo correla-

tion in phonon region, but in maxon and roton region the influence is about 16% and 5%, respectively. The discrepancy with experimental data of all approximants in maxon and especially in roton region shows that the basis with one and two-phonon functions describes well only phonons in liquid ^{4}He. (21 refs.)

119292 Excitation spectrum of liquid He^4. K.M.Khanna (Dept. of Materials Sci., Nat. Inst. of Foundry & Forge Technol., Ranchi, India).
Indian J. Cryog., vol.8, no.2, p.97-8 (1983).
Energy excitation spectrum for liquid He^4 was calculated using the formalism containing the density fluctuation operator ρ_k and the velocity operator V_k. The interaction potential was the Morse potential. The theoretical and experimental E_k did not agree because of the absence of the long tail in the square well attractive potential used in the calculations. Calculations were done using the Gaussian potentials and the results are in very good agreement with the experimental results. (5 refs.)

119293 About the nonlinear fluctuation-dissipation theorem for plasmas in two and three dimensions. D.X.Lu (Dept. of Phys., Northeastern Univ., Boston, MA, USA), K.I.Golden.
Phys. Lett. A (Netherlands), vol.97A, no.9, p.391-4 (26 Sept. 1983).
The authors establish for the first time the fundamental nonlinear fluctuation-dissipation theorem for classical electron films trapped on liquid helium surfaces. When formulated in a reduced polarizability language, this theorem becomes identical to its three dimensional counterpart. (7 refs.)

119294 Third sound and energy dispersion of helium films. A.Isihara (Dept. of Phys. & Astron., State Univ. of New York, Buffalo, NY, USA), Chung-In Um, Woo-Hyung Kahng, Hee-Gyun Oh, Soon-Tahk Choh.
Phys. Rev. B (USA), vol.28, no.5, p.2509-15 (1 Sept. 1983).
Adopting a soft potential the authors have made a microscopic approach to the velocity of third sound in liquid ^{4}He films and derived an explicit formula for its temperature variation. This formula explains the temperature dependence of third sound without ad hoc assumptions such as those used by Rutledge, McMillan, Mochel, and Washburn. In particular, the source of the temperature dependence of the coefficient to the T^3 term which resulted from their approach is naturally explained. (10 refs.)

67.50 FERMI FLUIDS; LIQUID HELIUM-3

119295 Analytic vortices and magnetic resonances in rotating superfluid ^{3}He-*A*. II. K.Maki (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2452-4 (1 Sept. 1983).
The earlier analysis of the vortex lattices in rotating ^{3}He-*A* is extended to lower temperatures. It is shown that, contrary to the earlier assertion, the observed satellite frequencies lie in between those associated with the circular and the hyperbolic vortices when the temperature-dependent corrections are properly included. Therefore, the author concludes that the vortex lattice of the circular-hyperbolic type is indeed realised in the Helsinki experiment. (9 refs.)

119296 Excitations in normal liquid ^{3}He. K.N.Pathak (Dept. of Phys., Panjab Univ., Punjab, India), M.Lucke.
Phys. Rev. B (USA), vol.28, no.5, p.2468-76 (1 Sept. 1983).
The dynamical density and spin-density response functions are expressed within a dispersion-relation representation in terms of the corresponding static susceptibilities and relaxation kernels. The kernels are approximated by two-mode decay processes. The resulting coupled integral equations are solved to get self-consistent spectral functions of the density and spin-density response. It is found that a density mode can decay into two density modes and two spin-fluctuation excitations whereas a spin-density fluctuation decays only into a density mode and a spin-density excitation. The theory predicts a well-defined zero-sound mode. The calculated excitation spectra of zero sound and spin-fluctuation excitations and their strengths are compared with neutron-scattering results. (25 refs.)

67.60 MIXED SYSTEMS; LIQUID HELIUM 3-4 MIXTURES

119297 Thermodynamic derivatives in ^{3}He-^{4}He mixtures in the critical region of the superfluid transition. A.Onuki (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.1-22 (Oct. 1983).
By assuming a phenomenological Ginzburg-Landau-Wilson free energy for ^{3}He-^{4}He mixtures near the critical surface of the superfluid transition the author can express thermodynamic derivatives of the form $(\partial a/\partial b)_{c,d}$ in terms of a correlation function of $|\psi|^2$, where ψ is the order parameter. Here a, b, c, and d are any four of the quantities entropy s, number density n, molar concentration X, temperature T, pressure p, and chemical potential difference $\Delta=\mu_3-\mu_4$. Relationships among these thermodynamic derivatives are those of the Pippard-Buckingham-Fairbank approximation in the ^{3}He-^{4}He case. Some combinations of the coefficients in the free energy are equal to derivatives on the critical surface and remain invariant with respect to renormalisation group transformations. A general scheme is also developed to give correlation function expressions for thermodynamic derivatives. (10 refs.)

119298 Convective instability of a superfluid ^{3}He-^{4}He mixture in a superleak. V.Steinberg (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.177-87 (Oct. 1983).
The convective instability of a superfluid ^{3}He-^{4}He mixture in a porous medium confined between parallel horizontal planes is studied. It is shown that this system behaves as a pure classical liquid in a porous medium from the point of view of the convective instability in the whole range of the phase diagram between the λ line and the coexistence curve. It is predicted that two-fluid effects become important for the convection onset and can be observed experimentally in this system at moderately low temperatures. This system is supposed to be the most convenient one to study experimentally convection in a porous medium. (16 refs.)

119299 Critical and tricritical dynamics in ^{3}He-^{4}He mixtures. A.Onuki (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.189-220 (Oct. 1983).
A new formalism is presented to study the critical and tricritical dynamics of ^{3}He-^{4}He mixtures near the superfluid transition for arbitrary concentration. In this fluid two conserved variables, the molar concentration X and the entropy s, are twofold coupled to a complex order parameter ψ first in the dynamic equations reversibly and second in the free energy dissipatively. However, at an intermediate concentration $X=X_D$ (which is 0.37 at the saturated vapor pressure) a linear combination of X and s is found to be asymptotically decoupled from ψ both reversibly and dissipatively. There, dynamic renormalization group equations reduce to those of pure ^{4}He (or those of the F model) and some dynamic properties are common to those of pure ^{4}He. For example, at $X\approx X_D$, the gradient $\nabla(T-T_\lambda)$ under heat flow goes to zero without ^{3}He mass flow, where T_λ is the critical temperature, dependent on X, and the thermodiffusion ratio loses the singularity with the critical exponent α. The dynamic renormalization group equations take into account the above two nonlinear couplings and can be used for any concentrations. Furthermore, using a linear response scheme, general relations are obtained among the kinetic coefficients. As a result the thermal conductivity on the λ line is found to be exactly proportional to X^{-1} at small X. The coefficient in front of X^{-1} can be expressed in terms of the diffusion constants of an isolated ^{3}He molecule in ^{4}He. (47 refs.)

119300 Vortex motion and mutual friction in ^{3}He-^{4}He mixtures in the critical and tricritical regions. A.Onuki (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.57-72 (July 1983).
The vortex motion is investigated under flow in ^{3}He-^{4}He mixtures near the λ line and near the tricritical point. Hall and Vinen's mutual friction parameters B and B' are found to diverge as $(T_\lambda-T)^{-1/3}$ at an intermediate molar concentration $X=X_D$ (which is 0.37 at saturated vapor pressure) as in pure ^{4}He. For other concentrations, however, they remain finite as $T\to T_\lambda$. The λ line value of B behaves as X^{-1} for $X\ll 1$ and as $(X-X_D)^{-2}$ for $X\simeq X_D$ whereas that of B' is 2. The point $X=X_D$ on the λ line is a singular point recently found by the present author. In the tricritical region B goes to zero as the inverse correlation length x and B' is very close to 2. There, a large concentration deviation is induced around a moving vortex line, giving rise to an enhanced resistance against the vortex line. As a unique feature in the tricritical region the vortex velocity must be nearly equal to the normal fluid velocity if the flow is sufficiently slowly-varying in time. (30 refs.)

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

119301 Localization and quantum diffusion of He^3 atoms stimulated by phonons in He^4 crystals. V.A.Mikheev, V.A.Maidanov, N.P.Mikhin (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Solid State Commun. (USA), vol.48, no.4, p.361-4 (Oct. 1983).
Using NMR technique the authors have measured the diffusion coefficient D of He^3 atoms in solid He^4 in a wide range of He^3 concentrations, densities and temperatures. It has been shown that in the low temperature plateau range D decreases sharply up to the values of $D\approx 3\times 10^{-12}$ cm^2 sec^{-1} when increasing concentration of He^3 up to 5%. The result obtained is indicative of the presence of strong localization of He^3 atoms in HCP phase of He^4 which is removed at the cost of quantum diffusion stimulated by phonons in full accordance with the theory predictions of Kagan (1981). The critical behaviour of D in the region of strong localization has been studied. The analysis of the contributions of different mechanisms to diffusion of He^3 has been made and this removes the available contradictions in the description of vacancy diffusion of He^3. For the first time the constant of dipole-dipole diffusion has been measured. (20 refs.)

119302 Acceleration of capillary impregnation by an external nonuniform electrical field. I.N.Karpovich, N.V.Churaev, M.S.Panchenko, A.L.Panasyuk (Dept. of Surface Phenomena, Acad. of Sci., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.920-6 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1044-50 (Nov.-Dec. 1982). [received: Sept. 1983]
It has been shown theoretically and experimentally that a nonuniform electrical field can have a substantial influence on the kinetics of liquid penetration into thin capillaries which represent a model of porous structures. The effect of the electrical field is most noticeable in the final stage of capillary impregnation. (9 refs.)

119303 Influence of additions of electrolytes and nonelectrolytes on the kinetics of the reduction of the surface tension of sodium alkylsulfate solutions. V.B.Fainerman, S.V.Lylyk (VINIPIchermetenergoochistka, Donetsk, Ukrainian SSR).
Colloid J. USSR (USA), vol.44, no.6, p.1001-9 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1141-50 (Nov.-Dec. 1982). [received: Sept. 1983]
The dynamic surface tension of aqueous solutions of sodium decyl, dodecyl, and tetradecyl sulfates without additives and with addition of various electrolytes and non-electrolytes was measured by the method of maximum pressure in a bubble in the range of surface life from 0.001 to 500 sec. The results obtained are evidence of the existence of a surface barrier to adsorption in these systems, which is due to a substantial degree to electrostatic interaction of the adsorbing and adsorbed surface-active ions and to hydrogen bonds in the surface layer of the solution. (25 refs.)

119304 Thermodynamic theory of the surface tension of liquids in homogeneous series of linear-chain molecules. V.M.Golubev (All-Union Res. Inst. for Synthetic Resins, Vladimir, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.1020-4 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1162-5 (Nov.-Dec. 1982). [received: Sept. 1983]
On the basis of ideas of a polymeric liquid as a quasisolution of end-groups in a medium of elementary links of long-chain molecules, an examination is made of the equilibrium in a two-phase liquid-vapor system with a planar rupture surface. Differential equations are derived for the dependence of the surface tension on the temperature, the pressure, and the chain length. A

comparison of the theoretical deduction with available experimental data indicates a positive adsorption of the end groups in the surface layer of a liquid linear polymer. (19 refs.)

119305 Thermodynamics of the adhesion of bubbles and drops in presence of a film. V.D.Samygin (Moscow Steel & Alloys Inst., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.1054-6 (Nov.-Dec. 1982). Translation of. *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1193-5 (Nov.-Dec. 1982). [received: Sept. 1983]
A description is given of the phenomena of adhesion of bubbles and drops, based on the surface of a solid. (8 refs.)

119306 Heat of wetting of hydrophobic sites on a surface by water. M.V.Tovbin, E.P.Skorobagat'ko, G.G.Buderaskaya, L.V.Savchuk, E.N.Nikolaets (Kiev Univ., Kiev, Ukrainian SSR).
Colloid J. USSR (USA), vol.44, no.6, p.1061-3 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1199-201 (Nov.-Dec. 1982). [received: Sept. 1983]
It has been established experimentally that the forced flow of water onto hydrophobic sites on a PbI_2 surface is an endothermic process. (8 refs.)

119307 Electro-optical device for surface and interface tension measurement. P.Baglioni (Istituto di Chimica Fisica, Univ. di Firenze, Firenze, Italy), F.Francini, G.Gabrielle, G.Longobardi.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.478-81 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A description is given of a high resolution electro-optical device that supplies, in real time, values of surface tension of a drop of macromolecular substances as a function of time up to the equilibrium (pendant drop method). The optical system has a high magnification and high free working distance; the detection system consists of an optical scanner and a self scanned device. The application to automated drop inspection is discussed in relation to the other form of inspection systems. (5 refs.)

119308 A transfer matrix approach to the 3D wetting and pinning problems. J.M.Luck, S.Leibler, B.Derrida (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France).
J. Phys. (France), vol.44, no.10, p.1135-42 (Oct. 1983).
The authors consider the pinning of an interface on a 3D lattice by an edge potential (semi-infinite geometry). This situation models the wetting transition occurring in such physical systems as binary fluids or adsorbed gases. The transfer matrix method is used to get exact results on strips of finite width; they propose a way of extrapolating them and of deriving the phase diagram of the infinite system. The mechanism of the transition changes when the pinning and roughening temperatures coincide. (19 refs.)

119309 Study of adsorption and solid-liquid interfacial tension of zinc-based ternary systems. C.Vahlas, N.Eustathopoulos (Lab. de Thermodynamique et Phys.-Chimie Metall., Domaine Univ., Saint Martin d'Heres, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.515-21 (June 1983). In French.
The interfacial tension of solid zinc in equilibrium with Bi, Cd and Pb, Sn liquid alloys has been measured using the 'dihedral angle method'. The interface enrichment factor of Cd and of Sn has been calculated from experimental results and the Gibbs adsorption equation. Tin segregates to solid Zn-liquid Pb interface, and leads to an important decrease in the interfacial tension. On the other hand, cadmium is not tensioactive at the interface solid Zn-liquid Bi, and the small variations of the interfacial tension with composition in this system Zn Bi Cd are only due to volume effects. The free energy of adsorption at infinite dilution of a C solute at the interface between solid A and liquid B has been evaluated with a simple thermodynamic model. These calculations and experimental results are in fairly good agreement. (23 refs.)

119310 The surface tension of liquid lead. A.Passerone, R.Sangiorgi, G.Caracciolo (Istituto di Chimica Fisica Applicata dei Materiali, CNR, Genova, Italy).
J. Chem. Thermodyn. (GB), vol.15, no.10, p.971-83 (Oct. 1983).
The liquid-vapour surface tension γ of lead has been determined by the sessile-drop method, under different physicochemical conditions, in the range 600.5 to 1150K. There has been found, on graphite and alumina supports: $\gamma/(\mathrm{mN.m^{-1}})=(444.2\pm1.0)\text{-}(9.4\pm0.3)\times10^{-2}(T\text{-}T_f)/\mathrm{K}$. Oxygen does not appear to have a measurable influence on the surface tension of lead, even under saturation of the liquid phase. (52 refs.)

119311 Surface chemistry of polyacetylene. A.Guiseppi-Elli, G.E.Wnek (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.159-62 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Explores the value of polyacetylene as an electrode material in aqueous media. The authors report on the determination of wettability and surface energy characteristics of pristine, iodine-doped and surface functionalized $(CH)_x$ and on the ion transport properties through $(CH)_x$ membranes. (10 refs.)

119312 Dynamic light scattering of surface fluctuations of a nematic liquid crystal. L.B.Shih, J.A.Mann, G.H.Brown (Liquid Crystal Inst., Kent State Univ., Kent, OH, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.47-60 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The autocorrelation function of small amplitude capillary ripples was studied as a function of temperature for para-azoxyanisole (PAA). Measurements were carried out in the temperature range of 125°-148°C with the transition temperature observed to be 135°C. The authors report results for the case of $q=252.0\ \mathrm{cm^{-1}}$. The spectra of the autocorrelation functions were fit by Lorentzian models to yield the surface tension as a function of temperature. Several 'temperature jump' measurements were made wherein the current to the heaters was changed so that the equilibrium temperature at T_0 was perturbed slightly. Correlation functions were determined as the temperature increased to a new equilibrium state. Large shifts in frequency and time damping of the autocorrelation function were observed only when the temperature jump spanned the nematic-isotropic transition temperature. Equilibrium surface tension numbers are reported. The theory and practice for the light scattering measurement are outlined briefly. (20 refs.)

119313 Absence of critical wetting in systems with long-range forces. M.P.Nightingale (Dept. of Phys., Univ. of Washington, Seattle, WA, USA), W.F.Saam, M.Schick.
Phys. Rev. Lett. (USA), vol.51, no.14, p.1275-8 (3 Oct. 1983).
Study of a solid-on-solid model within the Migdal approximation leads the authors to conclude that the phenomenon of critical wetting cannot occur in the presence of long range, van der Waals forces. (19 refs.)

119314 Survey of extant data for the surface tension of iron and its binary alloys. B.J.Keene.
Report NPL-DMA(A)-67, Nat. Phys. Lab., Teddington, England (June 1983), i+116 pp.
The two principal parameters which influence the surface tension of a liquid metal are the melt composition and temperature. A knowledge of the influence of these two variables is important both in understanding the fundamental aspects of liquid metal structures and in ensuring the technological success of some major industrial processes. This review covers extant data on the surface tension of pure iron and binary iron alloys (Fe+Al, Fe+Sb, Fe+As, Fe+B, Fe+C, Fe+Cr, Fe+Co, Fe+Cu, Fe+Ga, Fe+Ge, Fe+H, Fe+Mn, Fe+Mo, Fe+Ni, Fe+N, Fe+O, Fe+P, Fe+Pd, Fe+Pt, Fe+rare earth metals, Fe+Rh, Fe+Se, Fe+Si, Fe+S, Fe+Te, Fe+Sn, Fe+Ti, Fe+W, Fe+V, Fe+Zr). Also included in this review are surface adsorption data and the suggested surface structures based upon them. For convenience, values of surface tension are expressed throughout in modified S.I. units ($\mathrm{mN.m^{-1}}$), which permit direct comparison with the numerically equal dyne $\mathrm{cm^{-1}}$ units of the obsolete c.g.s. system. 68.15 LIQUID THIN FILMS

119315 Disentanglement of hydrophobic and electrostatic contributions to the film pressures of ionic surfactants. A.L.Nichols,III, L.R.Pratt (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Faraday Symp. Chem. Soc. (GB), no.17, p.129-40 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
The theory of electrolyte solution surfaces is extended to treat ionic surfactants spread on hydrocarbon-water interfaces. The object is to study the interplay between hydrophobic and electrostatic interactions responsible for micelle and membrane formation. Considerable attention is given to developing the theory in a reliable way so that hydrophobic effects can be reliably inferred by comparison with measured film pressures of ionic surfactants. The theory so constructed turns out to be remarkably sensitive to molecular-scale features of the interfacial region, particularly to the nature of water penetration behind the ionic head groups. The theory which assumes negligible water penetration provides a reasonable qualitative, but quantitatively deficient, description of the available experimental data for film pressures of sodium decylsulphate and sodium dodecylsulphate. After the cause of this behaviour is traced to the degree of water penetration permitted in the treatment, the authors adopt a heuristic modification of the result which compensates for the assumed neglect of water penetration. The resulting formulae provide an excellent quantitative description of the experimental film-pressure data. However, the heuristic nature of the result indicates that a considerably deeper molecular understanding of the short-ranged structure of these interfaces will be required before a conclusive picture can be presented. (34 refs.)

119316 Depinning and wetting transitions in one and two dimensions. S.T.Chui (Bartol Res. Found., Univ. of Delaware, Newark, DE, USA), K.B.Ma.
Phys. Rev. B (USA), vol.28, no.5, p.2555-60 (1 Sept. 1983).
Possible phase transitions and the critical properties of liquid films on top of substrates are discussed. The authors' ideas seem to explain a disagreement with mean-field theory in a recent experiment by Kwon et al. Connection with models in the context of instantons is pointed out. (27 refs.)

68.20 SOLID SURFACE STRUCTURE

119317 Temperature dependence of the sodium concentration over the sodium tungsten bronze ($Na_{0.79}WO_3$) surface studied by LEED. H.Nakamatsu, Y.Yamamoto, S.Kawai, K.Oura, T.Hanawa (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L461-3 (July 1983).
Temperature dependence of the LEED intensity of a tungsten bronze $Na_{0.79}WO_3$ (001) surface shows that the sodium concentration in the subsurface region increased as the temperature rises, while that at the topmost surface was kept constant in the (2×1) ordered phase. (14 refs.)

119318 Structure analysis of Ir(100) 1×1 by LEED (100-500 eV). G.Besold, K.Heinz, E.Lang, K.Muller (Inst. fur Angewandte Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1473-6 (1983).
LEED intensity measurements and dynamical calculations have been performed for the nonreconstructed Ir(100) surface. They were compared with each other using the Zanazzi-Jona factor for different energy ranges of the spectra, i.e. 100-250, 250-500, and 100-500 eV. It turns out that the surface relaxation is always nearly the same, at least within the error of the fit, $\Delta d/d=-2\%\pm2\%$. However, it appears that the r factors are definitely lower for the high energy region accompanied by a slight increase of the precision with which $\Delta d/d$ can be extracted. The Zanazzi-Jona factor of the total energy range cannot be interpreted as a linearly weighted average of these of the subranges. (14 refs.)

119319 Faceting of a Ge(111) surface and its vicinals during Ag adsorption. E.Suliga, M.Henzler (Inst. fur Festkorperphys., Univ. Hannover, Hannover, Germany).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1507-11 (1983).
The stability of a Ge(111) surface and its vicinals were studied by LEED for clean and Ag covered conditions. Before deposition the surfaces were macroscopically smooth. After deposition of only a few tenths of a monolayer of Ag and heating to 400°C, the surface consisted of narrow (544) facet planes and wide (111) terraces. At coverage above 0.7 the (544) facets disappeared and (211) facets started growing. The facets had dimensions in the range of 10 μ, so that they could be observed with an optical microscope. Furthermore, a rotation of ledges into directions with low indices was observed. The results show that the equilibrium shape of a surface is drastically changed by a coverage of a fraction of a monolayer due to the formation of new minima of the surface free energy at peculiar high index vicinal surfaces. (15 refs.)

119320 Surface reconstruction in crystals. D.B.Abraham (Dept. of Theoretical Chem., Univ. of Oxford, Oxford, England).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1279-81 (3 Oct. 1983).
A model is proposed which shows both a surface-reconstructive phase transition and a faceting transition, depending on the molecular parameters. It involves a further generalization of Lieb's six-vertex problem. (14 refs.)

119321 Physical origin of surface segregation in binary alloys. Yi-Chen Cheng (Dept. of Phys., Nat. Taiwan Univ., Taipei, Taiwan).
Phys. Rev. B (USA), vol.28, no.6, p.2937-9 (15 Sept. 1983).
Mill's theory of surface effects on a magnetic system is applied to the surface segregation phenomenon in binary alloys. The effect of lattice strain energy is not considered. It is shown that there are two driving forces for the surface segregation: (1) the difference in the surface energy of the composing elements, and (2) a collective effect depending on the relative concentration only. The former force predicts that the element with lower surface energy is enriched on the surface, while the latter force predicts an enrichment of the minority element on the surface. The above results are restricted to the alloys with positive heat of mixing and at a temperature higher than the bulk critical temperature. (18 refs.)

119322 Alkali metal-induced reconstruction of Ag(110). B.E.Hayden, K.C.Prince, P.J.Davie, G.Paolucci, A.M.Bradshaw (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Solid State Commun. (USA), vol.48, no.4, p.325-8 (Oct. 1983).
The adsorption of Li, K and Cs on the Ag(110) surface has been studied by LEED, AES and work function measurements. It was found that adsorption of small amounts of the three alkalis studied ($0.05<\theta<0.2$) induces a (1×2) reconstruction of the Ag(110) surface at 300K. The authors suggest that a redistribution of the alkali-induced increase in the density of states at E_F drives the surface phase transition via surface phonon softening. Similar behaviour observed on Cu(110) may indicate that alkali-induced reconstruction is a general phenomenon. (23 refs.)

119323 Evidence for 2×1 building block in the atomic structure of Si ⟨111⟩ 7×7. W.S.Yang, F.Jona (Dept. of Merials Sci. & Engng., Ste Univ. of New York, Stony Brook, NY, USA).
Solid State Commun. (USA), vol.48, no.4, p.377-9 (Oct. 1983).
The well known experimental Si ⟨111⟩ 7×7 LEED pattern is shown to exhibit systematic enhancement of diffracted intensity at the $^1/_2$-order positions, thus revealing the existence of 2×1 or 2×2 structural components in the 7×7 structure. comparison of experimental LEED spectra from the 7×7 structure with a single-domain Si 111 2×1 cleaved structure reveals remarkable similarities. The conclusion is that the fundamental building block of the 7×7 structure is a 2×1 subunit which closely resembles the unit cell of the cleaved 2×1 structure. (11 refs.)

119324 The change in the composition and structure of glass surface during the interaction with salt melts. I.M.Bushueva, S.R.Sergeeva, I.N.Kurbatova, T.L.Konovalova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.55-8 (Aug. 1983). In Russian.
The electrode behavior of glasses has been investigated in salt melts. Concentration profiles of the distribution of Na, K, Ca ions and SiO_2 in glass interacting with melts of KNO_3 and KNO_3-$Ca(NO_3)_2$ are discussed. (4 refs.)

68.25 MECHANICAL AND ACOUSTICAL PROPERTIES OF SOLID SURFACES AND INTERFACES

(for tribology, see 62.20P and 81.40P)

119325 Propagation and amplification of surface waves in a thermopiezosemiconducting medium. A.K.Pal (Dept. of Math., Jadavpur Univ., Calcutta, India).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.323-34 (Sept. 1983).
The problem of propagation and amplification of surface waves has been studied in a hexagonal piezoelectric medium which is also semiconducting in nature. It is well known that in addition to the piezosemiconducting properties these materials also possess the pyroelectric property. So in order to consider the most realistic situation, the present investigation takes into account the triple coupling between electrical, mechanical and thermal fields by linearizing the non-linear equations under small signal assumptions as it has been done in the paper by Hutson and White (1962). Expressions for the piezoelectric Poynting vector and the components of the power flow in the surface wave have also been derived in order to give to the problem its complete shape. (16 refs.)

119326 surface acoustic wave properties of thin film CdS prepared by hot wall technology. H.J.Rohde, H.J.Frohlich (Akad. der Wissenschaften, Zentralinst. fur Elektronenphys., Berlin, Germany).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.343-50 (1983).
Piezoelectric CdS thin films are prepared by vapour deposition using the hot wall technique. Optimum performance regarding their application to interdigital transducers of surface acoustic waves is obtained by a substrate temperature of 470K, a hot wall temperature 670K and rate of deposition=3 μm/h. Measurements of a RF voltage ratio in a simple circuit containing samples of CdS thin films deposited on top of interdigital structures allows calculation of electromechanical coupling coefficients. Values as high as 80% of the theoretical ones are obtained. (8 refs.)

119327 Diagnostics of the elastic properties of quartz and glass surfaces during ion implantation. I.I.Daugela, S.A.Ionyalyunas, L.I.Pranyavichyus (Antanas Snechkus Polytech. Inst., Kaunas, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.572-3 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1327-9 (Nov. 1982). [received: Sept. 1983]
The authors have used an acoustic method to study the elastic properties of the surface layers of single crystals of quartz and K-8 glass during the implantation of He^+ and Ar^+ ions. This acoustic method, which involves detecting the relative change $\Delta v_R/v_R$ in the propagation velocity of surface acoustic waves in the ion-bombarded material, has the advantages that it is nondestructive, accurate, and usable directly during the ion implantation (in situ). The relative change in the SAW propagation velocity was measured with a SAW delay line made from the material being studied. In the case of the glass, the SAWs were excited and detected by thin-film transducers made from piezoelectric zinc oxide films. (3 refs.)

119328 Examination of surface acoustic wave components using a scanning electron microscope. H.P.Feuerbaum, H.P.Grassl, U.Knauer, R.Veith (Forschungslab., Siemens AG, Munchen, Germany).
Scanning Electron Microsc. (USA), pt.1, p.55-63 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
Six methods have been used for the examination of surface acoustic wave components with a scanning electron microscope. Standing waves are visualized in the voltage contrast mode. Combined with stroboscopic techniques, the voltage contrast shows the propagation of travelling waves in detail. By a newly developed set-up the attenuation of travelling waves across a substrate can be measured. The application of these modes is demonstrated by the examination of SAW components on $LiNbO_3$. (13 refs.)

68.30 DYNAMICS OF SOLID SURFACES AND INTERFACE VIBRATIONS

119329 Relaxation effects in the vibrations of a lithium fluoride surface. E.R.Cowley, J.A.Barker (IBM Res. Lab., San Jose, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3124-9 (15 Sept. 1983).
The vibrational frequencies of a 15-layer slab are calculated for a simple shell model of lithium fluoride, and the surface modes occurring are analyzed. The static relaxations of a slab and of a single surface are calculated for the same model, and the effects of the relaxation on the vibrational frequencies are investigated. A puckering distortion of the surface layer is incorporated in the vibrational calculations for the first time and is found in this case to introduce one extra surface mode. (15 refs.)

119330 The kinetics of adsorption of surface active agents at gas-liquid surfaces. R.P.Borwankar, D.T.Wasan (Dept. of Chem. Engng., Illinois Inst. of Technol., Chicago, IL, USA).
Chem. Eng. Sci. (GB), vol.38, no.10, p.1637-49 (1983).
A general model of adsorption of surfactants at a gas-liquid surface has been developed, which accounts for both the diffusion in the bulk and the barrier to adsorption. In this model, the activation energy barrier to adsorption is accounted for by means of a kinetic expression. A numerical scheme for the solution of the resulting equation of the diffusion-kinetic model is illustrated for the case of the Frumkin isotherm. The model is used to estimate the extent of the adsorption barrier from the dynamic surface tension data of two aqueous surfactant systems reported in the literature. A simplification of the diffusion-kinetic model is proposed which accounts for diffusion in the bulk using diffusion-penetration theory. The simplified model compares very well with the exact model, especially for high barrier resistances. (33 refs.)

119331 Influence of molecular mass on the adsorption of oligobutadienes on oxidized carbon blacks. A.V.Kiselev, Yu.V.Malygin, V.N.Stroev, Yu.A.El'tekov (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.926-30 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1051-6 (Nov.-Dec. 1982). [received: Sept. 1983]
The adsorption of dilute solutions of narrow fractions of oligobutadienes with molecular masses of 500, 800, 2800, and 3000 in n-heptane has been studied on samples of PM-100 furnace carbon black, oxidized by air oxygen under various conditions. The conclusion has been reached that the size of the micropores of the adsorbents and the dimension of the oligomer molecules have a strong influence on the degree of adsorption. (9 refs.)

119332 Investigation of the sorption of stearic acid and its esters on steel. N.V.Volnyanskaya, O.S.Kas'yan (Inst. of Ferrous Metall., Dnepropetrovsk, Ukrainian SSR).
Colloid J. USSR (USA), vol.44, no.6, p.1016-20 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1158-62 (Nov.-Dec. 1982). [received: Sept. 1983]
A radiative tracer method and IR spectroscopy were used to study the sorption interaction of steel with solutions of stearic acid, distearin glycol ester, and butyl stearate in a hydrocarbon medium at 20-200°C. Stearic acid and distearin glycol ester were found to possess a strong tendency of forming

surface compounds; the amount formed was found to correspond to a polymolecular structure and to depend on the duration and temperature of interaction between metal and solution, the concentration of the solution, and that it could form up to 25-30 monolayers. The films obtained represent the intermediate stage in the formation of soaps, the final products of the surface reaction. (20 refs.)

119333 A cluster model method and its applications to chemisorptions on semiconductor surfaces. Zhang Kaiming, Xu Yongnian, Xie Xide (Modern Phys. Inst., Fudan Univ., Shanghai, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1065-73 (1983).
The cluster model and charge self-consistent method are used to study the chemisorptions on Si (111), Ge (111), and GaAs (110) surfaces. The parameters in the calculations are selected to fit the respective bulk energy bands of Si, Ge, and GaAs. Some general rules of chemisorptions on Si (111) and Ge (111) are investigated and speculated. The three-fold hollow site geometry is favorable for group III metals on Si (111), whereas the one-fold top site is more stable for group VII elements, the reason being probably one of the favorable charge distribution. However, the situation for chemisorptions on Ge (111) is somewhat different. The adsorptions of group III and V elements on GaAs (110) are also considered. The possible chemisorption geometries and the related electronic states for these systems are calculated and discussed. (30 refs.)

119334 Carbon segregation to the Pd(111) single crystal surface as seen in carbon monoxide thermal desorption spectra. I.Ratajczykowa (Inst. of Phys. Chem., Polish Acad. of Sci., Warszawa, Poland).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1512-17 (1983).
Carbon monoxide adsorption was studied on the Pd(111) surface with submonolayer carbon coverages. It is shown that carbon monoxide desorption spectrum can be used in the detection of a carbon coverage much below the detectability level of AES. Although the estimation of the absolute carbon coverage is subjected to quite a bit of uncertainty it seems that a few percent of a monolayer of carbon manifests clearly in the desorption spectrum at low carbon monoxide coverages. With the aid of CO desorption spectra the temperature dependence of the surface segregation of carbon was investigated at temperatures from 450 to 1300K with the mean C/Pd atomic ratio in the bulk ranging from 1×10^{-6} to 7×10^{-6}. At any temperature below 835K carbon does not appear on the surface. At higher temperatures carbon segregates at the surface very quickly and within a temperature range depending on the C/Pd ratio. Carbon that has been segregated on the surface can be easily redissolved even at temperatures as low as 450K. The behavior of carbon is explained in terms of formation and decomposition of the carbon-rich palladium phase $PdC_{0.13}$. Some implications for cleaning PD(111) crystals are also shortly discussed. (12 refs.)

119335 Effect of heat treatment on the structural characteristics and sorption properties of clinoptilolite. M.N.Kostandyan, S.G.Babayan, M.A.Balayan (All-Union Sci.-Res. Inst. of Chem. Reagents & Special-Purity Chem. Substances, USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1498-501 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1743-6 (Oct. 1982). [received: Sept. 1983]
It was shown that the structural changes that occur during dehydration are due to the participation of water molecules in the energy balance of zeolite. The optimum temperature range of the thermoactivation of clinoptilolite was determined as 520-670K. (5 refs.)

119336 Kinetics of hydrogen absorption by α-zirconium. S.Naito (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
J. Chem. Phys. (USA), vol.79, no.6, p.3113-20 (15 Sept. 1983).
The kinetics of hydrogen absorption by polycrystalline α-zirconium metals has been investigated by the use of spherical specimens in the pressure range 2×10^{-5}-1×10^{1} Pa and in the temperature range 673-1073K. The experimental results are reasonably explained on the basis of the model in which the process is assumed to be composed of three successive steps: dissociative adsorption with lateral interaction between adsorbed hydrogen atoms; jump of the absorbed hydrogen atom into the interstitial site; and finally its diffusion into the metal bulk. Both the first and third steps are rate controlling under the conditions of low pressures or low temperatures within the pressure and temperature ranges of this investigation. At low temperatures the absorption rate is significantly affected by the lateral interaction as the pressure is increased. Some parameters which charactrize the derived rate equations have been determined: the activation energies are $(1.7\pm0.5)\times10^{-21}$ J/H atom for dissociative adsorption and $(9.43\pm0.30)\times10^{-20}$ J/H atom for desorption, and the heat for jump is $(9.4\pm1.5)\times10^{-21}$ J/H atom. The lateral interaction is repulsive and its energy is $\sim4\times10^{-20}$ J/H atom for $0\leq\alpha\leq0.4$, where α represents the so-called transfer factor. (41 refs.)

119337 Ground state energy and structure of physisorbed monolayers of linear molecules. L.W.Bruch (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3148-56 (15 Sept. 1983).
Model calculations of the ground state configuration and energy of monolayers of CO_2 and of N_2 adsorbed on the basal plane surface of graphite are reported. The interaction models consist of atom-atom and site-site potentials and point quadrupole moments, as in models for the three-dimensional bulk solids, supplemented by effects of static and dynamic screening of multipole fields by surface charges on the graphite. There is a good quantitative agreement with estimated zero temperature heats of adsorption for N_2/Gr and the calculated ground state configuration is the $\sqrt{3}$ R 30° registered monolayer solid. For CO_2/Gr, the calculated low coverage isosteric heat differs by 15% from the experimental value, but the calculated lateral energy of the monolayer solid is consistent with available experimental information. Within the uncertainty caused by this discrepancy, the calculations are consistent with a suggested that CO_2/Gr is a nonwetting system at low temperatures. The ground state configuration of monolayer CO_2/Gr is calculated to be an incommensurate solid of number density within 5% of the number density of the $\sqrt{3}$ R 30° solid. (38 refs.)

119338 The sorptivity of brick: dependence on the initial water content. C.Hall, W.D.Hoff, M.Skeldon (Dept. of Building, Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
J. Phys. D (GB), vol.16, no.10, p.1875-80 (14 Oct. 1983).
The water absorption sorptivity of brick ceramic falls as the initial water content rises. New results and reanalysed literature data are in agreement with unsaturated flow theory. The approximate formulae of Philip (1957) and of Brutsaert (1976) are compared with experimental data, establishing the value of the Brutsaert formulae. (17 refs.)

119339 A study of SO_2 adsorption on CaO (100) surfaces using X-ray photoelectron spectroscopy. C.D.Stinespring (Morgantown Energy Technol. Center, Morgantown, WV, USA), J.M.Cook.
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.113-22 (Sept. 1983).
The adsorption of SO_2 on CaO (100) at 300K has been studied using X-ray photoelectron spectroscopy. Under ultrahigh-vacuum conditions, the surface was exposed to 0-500 Langmuirs of SO_2. The resulting adsorption yields a single S-O surface species with an S $2p$ peak at 168.2 eV and an O $1s_{1/2}$ peak at 531.7 eV. Subsequent heating of the exposed surface to 673K indicated no desorption or changes in the binding energies of the S $2p$ and O $1s_{1/2}$ peaks. On the basis of these data and binding-energy data for standard compounds, the absorbed species is identified as SO_4^{2-}. The surface coverage due to the SO_4^{2-} species was also measured as a function of SO_2 exposure. From these data, the initial adsorption is found to be first-order in surface coverage, and the initial sticking probability is found to have a value of 0.4. (16 refs.)

119340 Heat capacity of diatomic molecules adsorbed on a periodic substrate and the localized-to-mobile transition. A.Milchev (Inst. of Phys. Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria).
Phys. Status Solidi a (Germany), vol.79, no.1, p.301-8 (Sept. 1983).
Heat capacities and related thermodynamic functions of a system of isolated diatomic molecules adsorbed on a periodic substrate are calculated by means of classical statistical mechanics. It is shown that the thermal transition from localized-to-mobile behaviour of the system of dimers is clearly reflected by the characteristic shape of the specific heat vs. temperature curve. According to the present theoretical investigation the maximum in the specific heat curve marking the localized-to-mobile transition generally depends both on position and height on the values of the energy barriers W_x and W_y along the X- and Y-axes. For substrates with $W_x/W_y<1/4$ the single maximum splits into two maxima with different heights. Further, for a given substrate, one obtained qualitatively different specific heat curves (with a single or with two separate maxima) if adsorption of dimers with different length is considered. The physical backgrounds of the problem are elucidated in more detail in the case of 1D system. (7 refs.)

119341 Kinetics of ordering in two dimensions. I. Model systems. S.A.Safran, P.S.Sahni, G.S.Grest (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Lieden, NJ, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2693-704 (1 Sept. 1983).
The approach to equilibrium of ordered superlattice structures on surfaces is analyzed. Both Monte Carlo methods as well as analytic models of interacting domain walls are used to study the kinetics of quenched, two-dimensional systems with Q degenerate equilibrium states. In particular, the growth of long-range order in the magnetic analogs (Q-component Potts models) of the commensurate superlattice structures found on surfaces is analyzed in a study of the kinetics of typical domain geometries that are found when systems are quenched from high (disordered states) to low temperatures. Calculations and simulations of the time and temperature dependence of the domain sizes for the model system of isolated domains indicate that for two dimensions roughening fluctuations of the domain walls strongly influence the grain growth kinetics. Strip-shaped domains approach equilibrium almost entirely through these fluctuations, while circular domains shrink due to deterministic curvature, but with a rate that is strongly temperature dependent even for temperatures outside the critical region. Pinning effects in systems with $Q\geq3$ lead to extremely slow kinetics for particular domain geometries. Low-temperature quenches on a triangular lattice indicate that these pinned geometries are rarely nucleated, while quenches on a square lattice equilibrate much more slowly due to pinning. The application of the theory to superlattice grain growth on surfaces are discussed in the following paper which presents results for the kinetics of quenched systems in terms of the simple domain geometries examined here. (34 refs.)

119342 Kinetics of ordering in two dimensions. II. Quenched systems. P.S.Sahni, D.J.Srolovitz, G.S.Grest, M.P.Anderson, S.A.Safran.
Phys. Rev. B (USA), vol.28, no.5, p.2705-16 (1 Sept. 1983).
For pt.I see ibid., vol.28, p.2693 (1983). An efficient Monte Carlo procedure is applied to the study of the kinetics of low-and high-Q Potts models on surfaces quenched from a high temperature ($T\gg T_c$) to low temperatures ($T<T_c$). The kinetics of these models are analyzed in simulations which yield the time dependence of the size and shape of the domains. After an initial transient period the mean domain size R increases with time as $R\sim t^n$. For the triangular lattice at all temperatures and for the square lattice at temperatures $T<0.5T_c$, the exponent n decreases from $^1/_2$ for $Q=2$ (Ising model) to approximately 0.41 for large Q. The distribution of grain sizes and shapes is also calculated from the results of the simulations. For large Q, these distributions are time independent. On the square lattice at low temperatures the growth exponent is approximately equal to 0, due to the nucleation of pinned domains. The Monte Carlo results are discussed in terms of experimental studies of the ordering of adsorbed atoms on surfaces and of the growth of grains in polycrystalline materials. (38 refs.)

119343 Phase transitions in monolayers adsorbed on uniaxial substrates. H.J.Schnulz (Inst. Laue-Langevin, Grenoble, France).
Phys. Rev. B (USA), vol.28, no.5, p.2746-9 (1 Sept. 1983).
The phase diagram of a $p\times1$ uniaxial adsorbed layer is investigated theoretically, including the possibility of incommensurate phases. For $p=3$ and 4 the author determines the incommensurability crossover exponents at the commensurate-fluid multicritical point. The author then argues that due to a strong renormalization of the dislocation core energy the incommensurate phase should be stable up to the multicritical point for$p\geq3$. Possible phase diagrams for general p are discussed. (29 refs.)

119344 Shape of physical adsorption potentials. G.Vidali, M.W.Cole (Dept. of Phys., California Inst. of Technol., Pasadena, CA, USA), J.R.Klein.
Phys. Rev. B (USA), vol.28, no.6, p.3064-73 (15 Sept. 1983).
The possibility is considered that all physical adsorption potentials have the same shape. Evidence is collected from experiments (atomic scattering, low-energy electron diffraction, thermodynamics) and theory. New calculations are performed for He and Ar interacting with an Ar solid. The assembled information indicates that the shapes are, indeed, very similar. The length scale is found to be $l=(C_3/D)^{1/3}$, where D is the well depth and C_3 is the coefficient of the dispersion force. It appears that alkali halide surfaces provide a softer reduced repulsion than other systems; this is tentatively interpreted in terms of an induced dipole attraction. Comparison is made with other universal potential functions and with a simple model based on overlap with substrate charge density. (78 refs.)

119345 All-electron local-density theory of alkali-metal bonding on transition-metal surfaces: Cs on W(001). E.Wimmer, A.J.Freeman (Materials Res. Center & Phys. Dept., Northwestern Univ., Evanston, IL, USA), J.R.Hiskes, A.M.Karo.
Phys. Rev. B (USA), vol.28, no.6, p.3074-91 (15 Sept. 1983).
A theoretical study of the nature and the mechanism of the bonding of an alkali metal (Cs) on a transition-metal surface [W(001)] in the high-coverage limit is presented in order to understand and explain the lowering of the work function and to elucidate the role of W surface states and surface resonance states in the adsorption process. The analysis is based on all-electron local-density-functional results obtained with the authors' self-consistent full-potential linearized augmented-plane-wave method for thin films for (1) a five-layer slab of W, (2) an unsupported Cs monolayer, and (3) Cs in a $c(2 \times 2)$ structure on both sides of the five-layer W slab for three different Cs-W separations. They find that Cs forms a polarized-metallic rather than ionic overlayer: The Cs valence electrons originating from the atomic 6*s* states are polarized toward the W surface leading to an increase of electronic charge in the Cs/W interface region and a depletion of electronic charge on the vacuum side of the overlayer. In addition, the semicore Cs 5*p* electrons are markedly counterpolarized. The net result of these multiple surface dipoles is a lowering of the work function upon cesiation from 4.77 eV (clean five-layer W slab) to 2.77, 2.55, and 2.28 eV, corresponding to heights of the Cs atoms above the W surface of 2.60, 2.75, and 2.90 Å, respectively. The Cs-induced changes in the charge density are essentially localized outside the surface W atoms. The W *d* surface states and surface resonance states which are so characteristic of the W(001) surface are found to persist on the cesiated W(001) surface. The main effect of the Cs overlayer on these states is their energetic stabilization; this effect is most pronounced for the contamination-sensitive Γ_1 surface state just below the Fermi energy, which is lowered in energy by 1 eV due to hybridization with Cs *s* states. (135 refs.)

119346 Domain-growth kinetics of herringbone phases. O.G.Mouritsen (Dept. of Phys. Chem., Aarhus Univ., Aarhus, Denmark).
Phys. Rev. B (USA), vol.28, no.6, p.3150-2 (15 Sept. 1983).
The growth of two-dimensional herringbone phases following quenches from high to low temperatures is analyzed by computer simulation. The herringbone ordering is threefold degenerate and governed by an anisotropic-planar rotor model on a triangular lattice. The model describes the orientational properties of N_2 on graphite. The growth with time of the average domain radius is shown to be algebraic with a rather low growth exponent $n \simeq 0.25$. (24 refs.)

119347 Intrinsic defects of TiO_2 (110): Interaction with chemisorbed O_2, H_2, CO, and CO_2. W.Gopel, G.Rocker (Phys. Dept., Montana State Univ., Bozeman, MT, USA), R.Feirabend.
Phys. Rev. B (USA), vol.28, no.6, p.3427-38 (15 Sept. 1983).
The interaction of TiO_2 (110) with O_2, H_2, CO and CO_2 was studied by means of low-energy electron diffraction, X-ray photoelectron spectroscopy, electron energy-loss spectroscopy, thermal desorption, electron paramagnetic resonance, and measurements of changes in surface conductivities $\Delta\sigma$, and work functions, $\Delta\phi$, for $300 \leq T \leq 1000$K with particular emphasis on surface reactions involving intrinsic surface defects $2Ti^{3+}.V_O^{(+)}$. The defects are thermodynamically stable at high temperatures and act as donors and specific absorption sites for H_2 and CO. Surface and subsurface reactions involving O_2, H_2, CO, and CO_2 can be separated from each other by analyzing the $\Delta\sigma$ and $\Delta\phi$ effects in a charge-transfer model, which takes into account surface and bulk electronic states in the band gap attributed to the different defects formed during the interaction. (37 refs.)

119348 Effect of cluster size on the electronic properties of a chemisorption system. S.K.Saha, B.C.Khanra (Solid State & Molecular Phys. Div., Saha Inst. of Nuclear Phys., Calcutta, India).
Solid State Commun. (USA), vol.48, no.2, p.155-8 (Oct. 1983).
Tight binding cluster Bethe lattice model has been used to study the electronic properties of a chemisorption system for various sizes of substrate-atom clusters. For a single-orbital adsorbate on a simple cubic tight binding solid it has been shown that the chemisorption energy converges for a cluster consisting of the first and second nearest neighbours of the adsorbate. (10 refs.)

119349 Correlation function of large-period adatom lattices. I.F.Lyuksyutov (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1321-4 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2281-6 (Dec. 1982). [received: Oct. 1983]
An investigation is made of the correlation properties of large-period structures. It is shown that a Berezinskii phase, which is characterized by power-law decay of the correlations, can exist in such structures at temperatures $T > T_p$. Transition to this phase from one with an ordinary long-range order is isomorphous with a phase transition in a two-dimensional plasma. Therefore, in the static limit, in spite of the potential relief of the substrate which is considerably greater than the interaction between adatoms, the behavior of large-period structures at temperatures $T > T_p$ is equivalent to the behaviour of a crystal on a smooth substrate. (17 refs.)

119350 Phase transitions in adsorbed films. I.F.Lyuksyutov.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1281-303 (Sept. 1983). In Russian.
A review of theoretical models of phase transitions on surfaces is presented. Different types of phase transitions—from the long-range order phase to the disordered phase and to the quasi-long range order phase, commensurate-incommensurate crystal phase, two-dimensional melting, etc.—are discussed. Examples of modern experimental studies in surface phase transitions are considered. (55 refs.)

119351 Ellipsometric investigation of cerium (III) cation adsorption on the platinum electrode in sulfuric acid solution. I.A.Vinokurov, V.I.Kravtsov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.106-7 (Aug. 1983). In Russian.
It is shown ellipsometrically that cerium (III) and cerium (IV) are not adsorbed on the platinum electrode at potentials 0.45-1.60 V. (9 refs.)

119352 Surface diffusion of iodide ions chemisorbed on silver. E.A.Daniels, M.Y.Pandit (Dept. of Chem., Univ. of Poona, Pune, India).
Z. Phys. Chem., Wiesbaden (Germany), vol.133, no.2, p.215-28 (1982). [received: Oct. 1983]
Phenomena of surface diffusion and surface self-diffusion of I^- adions on polycrystalline silver are studied by a radiotracer technique. At a given temperature the diffusion coefficient measured for surface coverages extending up to monolayer increased with increasing coverage. At fixed temperature and surface coverage the coefficient of surface diffusion is slightly greater than that of surface self-diffusion. The two types of diffusion phenomena are considered in the light of accompanying entropy changes as well as the surface spreading forces involved. (25 refs.)

68.48 SOLID-SOLID INTERFACES

(inc. bicrystals; for grain boundaries, see 61.70N)

119353 (HgCd)Te-SiO_2 interface structure. J.A.Wilson, V.A.Cotton (Santa Barbara Res. Center, Goleta, CA, USA), J.Silberman, D.Laser, W.E.Spicer, P.Morgen.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1719-22 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Low-temperature chemical vapor deposited (CVD) SiO_2 has proven to be a very important material for use as a passivation on HgCdTe, principally because it combines a high resistivity and low-temperature application with excellent interface electronic structure. As previously reported, capacitance measurements show no frequency dispersion, and N_{SS} minima below 1×10 cm^{-2} eV^{-1} have been realized. The authors report here on an investigation of the composition and structure of the interface between PHOTOX SiO_2 and HgCdTe. Wafers of zone melt HgCdTe, with $x=0.3$ and coated with PHOTOX SiO_2, were analyzed with simultaneous Auger electron spectroscopy (AES) and Ne ion milling. The surface of the wafer was also studied with AES and surface ellipsometry before the SiO_2 was deposited. Ellipsometry indicates the presence of a thin film on the HgCdTe due to the surface treatment, with thicknesses which vary between 10 and 20 Å from wafer to wafer. The AES measurements indicate a Te count rate similar to that in bulk HgCdTe, plus significant oxygen signal, indicating the thin film is predominantly Te-oxide. Sputter-Auger SiO_2 on HgCdTe shows an interface region width of ~50 Å. The dominant signals from this region are Si, O, and Te. The Te line shift indicates that an oxide is not present. The authors interpret this to indicate that the initial thin Te-oxide layer has been substantially reduced, leaving an interfacial layer of Si, Te, and O between the applied SiO_2 and HgCdTe. The increase in N_{SS} of interfaces formed on oxide-free HgCdTe indicate this interface layer is beneficial to device passivation. (9 refs.)

119354 Auger spectroscopy of metal-semiconductor interface in the In-$Pb_{1-x}Sn_xTe$ system. T.A.Grishina, I.A.Drabkin, Yu.P.Kostikov, A.V.Matveenko, N.G.Protasova, D.A.Sakseev.
Inorg. Mater. (USA), vol.18, no.10, p.1467-72 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1709-13 (Oct. 1982). [received: Sept. 1983]
The concentration profiles of chemical elements in In-$Pb_{1-x}Sn_xTe$ interface were studied by the method of Auger spectroscopy. It was shown that when In is thermally sputtered on $Pb_{1-x}Sn_xTe$, a chemical interaction between In and the semiconductor occurs. Deposition of $Pb_{1-x}Sn_xTe$ on In eliminates this interaction, but heating of the junction obtained causes chemical interactions between In and the semiconductor. A qualitative explanation is proposed for the chemical interaction processes occurring on the In-$P_{1-x}Sn_xTe$ interface. (13 refs.)

119355 Influence of substrate deformations on interface structures. II. Experimental investigations for epitaxial Ag/Pd and Au/Pd bicrystals. E.Pippel, J.Woltersdorf (Inst. fur Festkorperphys. und Elektronenmikroskopie, Akad. der Wissenschaften, Halle, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.189-98 (Sept. 1983).
For pt.I see ibid., vol.78, p.475 (1983). The influence of substrate relaxations on pseudomorphic growth in Ag/Pd island bicrystals and continuous Au/Pd films is investigated using transmission electron microscopy. For several substrate and deposit thicknesses the radii of curvature resulting from bending contours are measured. Further on the critical deposit thickness for complete pseudomorphism is deduced from the first appearance of misfit dislocations. Both quantities strongly depend on the bending of the substrate layer. The experimental results are compared with theoretical values. Finally, some contrast problems of misfit dislocations and moire lines are discussed as they arise in the case of epitaxial bicrystals. (15 refs.)

119356 Compound formation and bonding configuration at the Si-Cu interface. G.Rossi, I.Lindau (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3597-3600 (15 Sept. 1983).
Joint photoemission and Auger *LVV* line-shape spectroscopies on the Si-Cu interface show the existence of a silicidelike compound with bonding characteristics similar to those of the near-noble-metal silicides. This makes the Si-Cu interface different from the other noble-metal-Si interfaces where alloy-like phases (Si-Au) or narrow interfaces with concentration gradients (Si-Ag) are formed. The Si-Cu compound is metal-rich with a stoichiometry close to the eutectic composition Cu_3Si and is stable over a wide range of temperatures. (22 refs.)

119357 Silicon-gallium-phosphide heterostructures with a $(Si_2)_x(GaP)_{1-x}$ transition region. M.E.Boiko, L.B.Karlina, Yu.V.Shmartsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.559-60 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1299-302 (Nov. 1982). [received: Sept. 1983]
The authors report a study of silicon-gallium-phosphide semiconductor heterostructures with a $(Si_2)_{x}\cdot(GaP)_{1-x}$ transition region. The layers are grown under isothermal conditions on silicon substrates in the (111), (110) and (100) orientations from gallium or tin molten solutions which are initially undersaturated with respect to the components to be deposited and which trigger some dissolution of the substrate (nonequilibrium epitaxy). The growth time is 5-15 min, and the growth temperature range is 840-860°C. The thickness of the resulting films are 0.1-40 μm. The composition of the transition region is determined by X-ray spectral microanalysis. (7 refs.)

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

119358 Preparation of Pb-Bi film by alloy evaporation. II. Microstructure and morphology. H.-C.W.Huang, C.M.Serrano (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1409-15 (1983).
For pt.I see Thin Solid Films, vol.91, p.201 (1982). In a previous paper, techniques were developed to obtain hexagonal-close-packed (27-32 wt.% Bi) Pb-Bi alloy films by evaporating from an alloy source. For the work reported here, Pb-Bi films were prepared under various evaporation rates, substrate temperatures, and residual gas pressures with a goal to obtain smooth and fine-grained films. Contrary to what is generally expected, the grain size, as measured at room temperature after sample warm up, increased by a factor of 3 to 5 when the substrate temperature T_s was lowered from 273 to ~180K and below. Evidence to be presented suggests that although fine grains were obtained at low T_s, significant grain growth has occurred when the films were warmed from $T_s < 200K$ to room temperature. Grain sizes of Pb-Bi films prepared at 77K were reduced when the films were doped with H_2O during deposition or seeded with 5-10 nm thick layers of Pb-Bi or O_2-doped Pb. But no grain size reduction was observed for films doped with O_2 at 77K or seeded with Au or Pd at 273K. The dependence of film morphology on composition, deposition rate, and substrate temperature were also investigated. For fine-grained Pb-Bi films prepared as described above, hillocks and/or holes were typically observed. (18 refs.)

119359 A technique using a Wheatstone bridge to study the minute differences in nucleation and growth of two metallic films. U.K.Chaturvedi, S.K.Agrawal, A.K.Nigam (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1416-19 (1983).
A technique has been developed to study the differences in the nucleation and growth of metallic films during their vacuum thermal deposition. The '*P*' and '*Q*' resistance arms of a Wheatstone bridge are made equal and arms '*R*' and '*S*' are replaced by two substrates having proper contacts, facing the vapor source in the vacuum chamber. During deposition, if nucleation and growth conditions of the films on these substrates are exactly identical, no voltage difference is developed across the junctions '*PQ*' and '*RS*' of the bridge throughout the growth of the films. If, however, there is even a minute difference in the nucleation and growth sequence of these films, the critical time at which the films become conductive may be different for both the films which ultimately gives a rectangular pulse-type signal which is recorded by the X-Y recorder. As the critical thickness at which the metal film becomes suddenly conductive is dependent on a large number of factors, e.g. flux and species of vapor, structure and temperature of the substrate, residual gas pressure and its nature, fields present on or nearby the substrate, etc., this technique has potential applications in metallic thin film technology. (3 refs.)

119360 Growth kinetics of platinum silicide. M.Wittmer (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5081-6 (Sept. 1983).
The influence of substrate orientation and dopant on the growth kinetics of Pt_2Si and PtSi have been studied. It was found that the growth of both silicides is diffusion limited and independent of substrate orientation. However, on substrates doped with an arsenic concentration of 5×10^{20} cm^{-3} the preexponential factor of the PtSi growth kinetics is lowered by a factor of 2, but the activation energy remains unchanged. This change in the preexponential factor is independent of the Si substrate orientation. The results are discussed in terms of possible diffusion mechanisms in PtSi. (21 refs.)

119361 Metal-organic vapor deposition of CdTe and HgCdTe films. W.E.Hoke, R.Traczewski (Raytheon Res. Div., Lexington, MA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5087-9 (Sept. 1983).
Epitaxial films of CdTe and HgCdTe have been grown on $\langle 111\rangle A$ CdTe substrates using metal-organic reagents. Specular CdTe films were grown at the investigated substrate temperatures between 370 and 410°C. Specular $Hg_{1-x}Cd_xTe$ films with $X\geq0.15$ were obtained at substrate temperatures of 400-410°C. The HgCdTe growth rate was nominally 6 μm/h for $Hg_{0.8}Cd_{0.2}Te$. The HgCdTe films are *n* type and a liquid nitrogen mobility of 140000 cm^2/V sec was measured for $Hg_{0.85}Cd_{0.15}Te$. The interdiffusion width at the CdTe-HgCdTe heterojunction is nominally 1 μm. (7 refs.)

119362 The role of lattice strain in the phase equilibria of III-V ternary and quaternary semiconductors. P.K.Bhattacharya, S.Srinivasa (Dept. of Electrical & Computer Engng., Oregon State Univ., Corvallis, OR, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5090-5 (Sept. 1983).
Liquidus and solidus isotherms for ternary $Ga_xIn_{1-x}As$ and $Al_xIn_{1-x}As$ and quaternary $In_{1-x}Ga_xAs_{1-y}P_y$ and $In_{1-x}Ga_xAs_{1-y}Sb_y$ alloy semiconductors have been calculated using the regular solution phase equilibria model for liquid phase epitaxial growth. The effect of lattice-mismatch strain in the growing layer has been incorporated in the model. Calculations have been made in order to make comparisons with published results of previous workers for both lattice-matched and mismatched layers. It is found that agreements are better with the inclusion of strain than with a zero-strain model. (30 refs.)

119363 Growth and photoluminescence spectra of high-purity liquid phase epitaxial $In_{0.53}Ga_{0.47}As$. P.K.Bhattacharya, M.V.Rao (Dept. of Electrical & Computer Engng., Oregon State Univ., Corvallis, OR, USA), Ming-Jong Tsai.
J. Appl. Phys. (USA), vol.54, no.9, p.5096-102 (Sept. 1983).
High-purity liquid phase epitaxial $In_{0.53}Ga_{0.47}As$ has been grown on semi-insulating (100) InP:Fe substrates. The electrical characteristics of the layers were determined from Hall measurements. Different melt-baking schemes were used to improve the purity of the grown layers. Such layers were *n*-type with N_D and $N_A\sim10^{14}$ cm^{-3} and with μ_{300K} and $\mu_{77k}=9000$ and 55000 cm^2/V s, respectively. High-resolution photoluminescence measurements were performed with the as-grown and heat-treated layers at temperatures down to 4.4K.. Measurements at different temperatures and with varying excitation intensity helped to elucidate excitonic and impurity-related transitions. The most intense peaks at the highest energies arise from bound excitons. Carbon is usually not detected in the LPE crystals except those grown after 100 h or longer melt baking. The binding energy E_A of carbon acceptors is 13.0 ± 1.0 meV. Other acceptor-related transitions observed in the spectra are Zn with $E_A=28.0\pm1.0$ meV and Si with $E_A=33.0\pm2.0$ meV. An LO-phonon replica of the Zn-related transition was consistently observed with $\hbar w_{LO}=32.0\pm1.0$ meV. From the measurements it transpires that the 0K band gap of $In_{0.53}Ga_{0.47}As$ is ~0.822 eV. (31 refs.)

119364 Residual shallow acceptors in GaAs layers grown by metal-organic vapor phase epitaxy. A.P.Roth, S.Charbonneau, R.G.Goodchild (Div. de Chimie, Conseil Nat. de Recherches, Ottawa, Ontario, Canada).
J. Appl. Phys. (USA), vol.54, no.9, p.5350-7 (Sept. 1983).
A study of the residual impurities present in GaAs layers grown by metal-organic vapor phase epitaxy has been conducted. Gallium arsenide layers were grown from three different trimethylgallium sources as a function of the substrate temperature and the arsine partial pressure which are the main factors controlling the concentration of residual impurities. A study of the low temperature photoluminescence spectra of the layers supported by preliminary secondary ion mass spectroscopy measurements shows that the major residual acceptors are carbon, magnesium, and zinc. (27 refs.)

119365 The preparation and characterization of strained-layer superlattices in the GaAs+GaP system. R.M.Biefeld, G.C.Osbourn, P.L.Gourley, I.J.Fritz (Sandia Nat. Labs., Albuquerque, NM, USA).
J. Electron. Mater. (USA), vol.12, no.5, p.903-15 (Sept. 1983).
The technique of metal organic chemical vapor deposition has been used to prepare strained-layer superlattices in the GaAs+GaP system. The superlattices consist of alternating layers of GaP and $GaAs_xP_{1-x}$ for x=0.2 to 1.0, which vary in thickness from 30 to 400 Å. The layers were grown by the decomposition of trimethylgallium and various mixtures of AsH_3 and PH_3 in H_2 at 800°C. The thickness and uniformity of the layers were determined by optical and transmission electron microscopy and X-ray diffraction. The composition of the layers was determined from X-ray diffraction. A new analysis has been developed to determine the layer strain as well as the composition of thick layers (~300 Å). Transmission electron microscopy has been used to yield direct evidence that strained-layer superlattices can be used to remove misfit dislocations generated during the epitaxial growth of a $GaAs_xP_{1-x}$ alloy on a lattice mismatched GaP substrate. These results are in agreement with the previous work of Matthews and Blakeslee (1977). Optical absorption, photocurrent spectroscopy and photoluminescence have been used to determine the band gap energy as well as the energies for other optical transitions. The values are in excellent agreement with the values predicted by tight binding and effective mass calculations. (11 refs.)

119366 Transient behaviour of intrinsic gettering in CZ silicon wafers. H.Tsuya, F.Shimura (Fundamental Res. Labs., Nippon Electric Co. Ltd., Kawasaki, Japan).
Phys. Status Solidi a (Germany), vol.79, no.1, p.199-206 (Sept. 1983).
The transient behaviour of intrinsic gettering (IG) is clarified for the first time on the silicon wafer with surface defects introduced by the pre-annealing in wet O_2 at 1140°C. It is found that surface defects introduced by the pre-annealing in O_2 at higher temperatures, which are speculated to be heavy metal clusters by the authors, migrate to an inner region and are gettered by inner defects during the post-annealing at lower temperatures such as 950°C. These results suggest that surface defects introduced by pre-oxidation process can be gettered during device heat treatment at comparatively lower temperatures if microdefect nuclei are suitably given. (19 refs.)

119367 Oxygen-bonding environments in glow-discharge—deposited amorphous silicon-hydrogen alloy films. G.Lucovsky, J.Yang, S.S.Chao, J.E.Tyler, W.Czubatyj (Energy Conversion Devices Inc., Troy, MI, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3225-33 (15 Sept. 1983).
Presents the results of a systematic study of oxygen incorporation in *a*-Si:H alloys produced by the glow-discharge decomposition of SiH_4, H_2, and O_2. The authors identify four oxygen-related absorption bands at 2090, 980, 780, 500 cm^{-1}, and show that the absorption strength in each band scales linearly with the oxygen concentration. They demonstrate that oxygen can increase the solubility of hydrogen in *a*-Si in the monohydride bonding geometry. The features identified above are shown to be characteristic of a bonding site in

which the oxygen and hydrogen atoms are bonded to the same silicon atom. They find no features in the infrared absorption that are associated with bonding configurations having OH groups. In films containing both oxygen and polysilane bonding, as evidenced by the doublet absorption at 845 and 890 cm^{-1}, they find no evidence for bonding sites in which a substantial fraction of the silicon atoms have one oxygen and two hydrogen neighbors. (14 refs.)

119368 Nitrogen-bonding environments in glow-discharge-deposited a-Si:H films. G.Lucovsky, J.Yang, S.S.Chao, J.E.Tyler, W.Czubatyj (Energy Conversion Devices Inc., Troy, MI, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3234-40 (15 Sept. 1983).
The authors have studied the local bonding of nitrogen atoms in a glow discharge-deposited films of a-Si:H by using IR absorption spectroscopy. They find two different bonding environments for N, which are identified through different frequencies for the Si-N asymmetric bond-stretching vibration, 840 cm^{-1} for the high-T_s films, and 790 cm^{-1} for the low-T_s films. In films deposited on substrates held at temperatures in excess of 300°C, the N is incorporated in a planar site with three silicon nearest neighbors, and one hydrogen second-nearest neighbor. In films produced on substrates held below 200°C, the N atom is also in a threefold-coordinated planar site, but with all of the nearest and second-nearest atoms being Si atoms. (18 refs.)

119369 Bonding in hydrogenated hard carbon studied by optical spectroscopy. B.Dischler, A.Bubenzer, P.Koidl (Fraunhofer-Inst. fur Angewandte Festkorperphys., Freiburg, Germany).
Solid State Commun. (USA), vol.48, no.2, p.105-8 (Oct. 1983).
Amorphous hydrogenated carbon thin films (a-C:H) were prepared by RF plasma deposition from benzene vapor. Optical absorption in the range 0.2-25.0 μm was measured and used for bonding analysis. Changes by thermal anneal in six steps between 250° and 600°C have been studied. The optical gap decreases from 1.2 to 0.17 eV upon annealing. The fine structure of the C-H stretch absorption spectrum (3400-2700 cm^{-1}) yields quantitative information on the fraction of sp^3, sp^2, and sp^1 hybridisation in the carbon network. In as-grown a-C:H $^2/_3$ of the carbon atoms are tetrahedrally coordinated (sp^3:sp^2:sp^1=68:30:2%). Thermal anneal above 300°C converts sp^3 into aromatic sp^2 with 63% sp^2 at 500°C and ~100% sp^2 at 600°C. (16 refs.)

119370 Local structure of amorphous $Mo_{50}Ni_{50}$ determined by anomalous X-ray scattering using synchrotron radiation. S.Aur, D.Kofalt, Y.Waseda, T.Egami (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA), R.Wang, H.S.Chen, Boon-Keng Teo.
Solid State Commun. (USA), vol.48, no.2, p.111-15 (Oct. 1983).
Anomalous (resonance) X-ray scattering technique using synchrotron radiation was applied to determine the compositionally resolved local structure of sputter deposited amorphous $Mo_{50}Ni_{50}$. The local environments of Mo atoms and Ni atoms were found to be significantly different from each other, but similar to the corresponding local environments in crystalline MoNi. The results compare favorably with those of the EXAFS measurement. (15 refs.)

119371 Two regions of amorphous state in CoPd alloy films of equiatomic composition. E.M.Artem'ev, A.S.Komalov, A.A.Smyk (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.547-8 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.949-50 (March 1983). [received: Oct. 1983]
The authors have investigated the crystal structure of Co-Pd alloy films of compositions close to equiatomic. These films were grown on various substrates, at various substrate temperatures T_s. They observed two regions of T_s in which films exhibiting a diffuse halo in electron diffraction patterns were obtained. The composition and thickness were monitored by X-ray fluorescence analysis. The films were condensed on substrates kept at temperatures T_s from −100 to 320°C. In the range of T_s from −100 to −10°C and from 150 to 190°C the investigated alloy was condensed in the amorphous state on all the substrates, including LiF and MgO single crystals, whereas in the range of T_s from 30 to 140°C a two-phase state was observed with an FCC phase (a=0.372 nm) and a BCC phase (a=0.322 nm), whereas at T_s above 200°C the films consisted of a single FCC phase with a=0.375 nm. (2 refs.)

119372 On the chlorine content in chemically sprayed tin oxide films: a quantitative analysis. I.Chambouleyron, C.Constantino, M.Fantini (Phys. Inst., Univ. Estadual de Campinas, Campinas, Sao Paulo, Brazil), M.Farias.
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.127-38 (July-Sept. 1983).
SIMS and AES analyses have been performed on tin oxide films grown by the chemical spray method at temperatures ranging from 260 to 490°C. Compositional analysis shows that non-intentional chlorine doping is always present to an amount that strongly depends on reaction temperature. This effect was quantified and explained in terms of a competitive process between chlorine adsorption and chlorine volatilization during the incomplete hydrolysis reaction. The presence of hydrogen into the films as well as OH groups was detected albeit not quantified. (21 refs.)

119373 Investigation of copper oxide coatings for solar selective applications. A.Scherer, O.T.Inal, A.J.Singh (Dept. of Metall. & Materials Engng., New Mexico Inst. of Mining & Technol., Socorro, NM, USA).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.139-58 (July-Sept. 1983).
Copper was oxidized using thermal, chemical and electrochemical treatments in an attempt to obtain a solar selective surface with a reasonable thermal stability. Microstructural analyses using SEM and X-ray diffraction, were made to investigate the influence of heat treatment on the coatings. A non-linear programming technique was used to optimize the coating conditions using as-plated and heat-treated (10 h at 180°C) data. Since a marked difference between the as-plated and the heat-treated optima was observed, a systematic thermal stability study of the copper oxide at low temperatures (below 200°C) was conducted. The stability of the chemical oxidizing solution was also investigated. As-plated absorptances of 0.97 at emittances of 0.2 were obtained in the optimized coatings. After thermal treatment, these absorptances and emittances were substantially reduced (α=0.89, ϵ=0.10). This reduction at higher temperature is attributed to a chemical change in the coating composition. (11 refs.)

119374 Structural and optical studies of topotaxially-grown Cu_2S from sprayed CdS thin films. B.Rezig, J.Bougnot, M.el Hammouti, M.Perotin, V.Bay, M.Savelli (Centre d'Electronique de Montpellier, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.189-98 (July-Sept. 1983).
Thin Cu_xS layers are obtained by a wet conversion method (dipping) of CdS sprayed films of about 1 μm thickness. The structural evaluation of these copper sulfides involved phase identification as well as lattice and orientation parameters. X-ray diffraction, a nondestructive method, was systematically used to investigate partially or completely converted layers of undoped CdS. The results of the corresponding compositional and optical investigations are presented. (13 refs.)

119375 Characterizaiton of eptiaxial films of CdTe and CdS grown by hot-walled epitaxy. H.Sitter, J.Humenberger, W.Huber, A.Lopez-Otero (Inst. fur Experimentalphys., Univ. Linz, Linz, Austria).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.199-206 (July-Sept. 1983).
Using the method of hot-wall epitaxy, layers of n-type CdTe and CdS doped with indium were grown on monocrystalline BaF_2 and SrF_2 substrates, respectively. The authors measured mobilities of 600 cm^2/Vs for CdTe and 230 cm^2/Vs for CdS. The mobility of some samples increased exponentially with temperature in the temperature range of 300 to 100K. This effect can be explained by means of a grain boundary model. However, in other samples bulk scattering mechanisms play a significant role for temperatures lower than 100K. The mobility as a function of grain size was also investigated. For the characterization of carrier traps in the CdTe films the authors performed deep level transient spectroscopy measurements. They found six different defect levels in the upper half of the forbidden gap. (16 refs.)

119376 Preparation and properties of sputtered a-Si:H:F films. W.Beyer, J.Chevallier, K.Reichelt (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.229-45 (July-Sept. 1983).
Amorphous Si:F, Si:H:F and Si:H films have been prepared by reactive sputtering of silicon. The film composition was investigated by Rutherford backscattering and by nuclear reaction techniques, the electronic properties by conductivity, thermopower and photoconductivity measurements and the thermal stability by gas evolution and annealing experiments. (38 refs.)

119377 Effect of conditions for producing amorphous metallic films of hypereutectic iron-boron alloy on their structure. G.M.Zelinskaya, A.V.Romanova, V.V.Nemoshkalenko, V.P.Naberezhnykh, B.F.Belov, V.V.Bukhalenko, A.G.Il'yinskii, A.I.Senkevich.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1393-9 (Sept. 1983). In Russian.
An X-ray examination was carried out for hypereutectic $Fe_{82}B_{18}$ melt in a temperature range of 1520−1820K and for vitreous films produced at various cooling rates and holding time of the melt before 'quenching' at almost liquidus temperature. An accelerated B diffusion to the surface is established and chemical composition of the sample surface in amorphous and crystalline states is determined. It is shown that the electron binding energy of Fe atoms is different for amorphous and crystalline states. The alloy structure in liquid and amorphous states is established to be microinhomogeneous as to the type of short-range order and distribution of the components. A rise in the melt temperature and an increase in holding time in the liquid state induce structural alterations. Low cooling rates may result in formation of a crystalline metastable Fe_3B phase with different crystalline cells. (9 refs.)

68.60 PHYSICAL PROPERTIES OF THIN FILMS, NONELECTRONIC

119378 Stress in chemical-vapor-deposited SiO_2 and plasma-SiN_x films on GaAs and Si. C.Blaauw (Bell-Northern Res., Ottawa, Ontario, Canada).
J. Appl. Phys. (USA), vol.54, no.9, p.5064-8 (Sept. 1983).
Stress was measured in films of chemical-vapor-deposited SiO_2 and plasma-deposited SiN_x on GaAs, in the temperature range 20-300°C, using the laser beam deflection method to measure the curvature of the substrate. Film thickness was in the range 1000-7500 Å. SiO_2 films with and without P doping were deposited at 425°C in a silox reactor. Stress in these films is independent of film thickness. The intrinsic stress σ_i is tensile with $\sigma_i=5.1\times10^9$ dyne/cm^2 and $d\sigma/dT=12.6\times10^6$ dyne/cm^2°C for undoped films. P doping decreases the value of each of these parameters. Films of SiN_x were deposited at 500°C in a plasma-reactor. Both σ_i and $d\sigma/dT$ decrease with film thickness, with values on the order of $5\text{-}15\times10^9$ dyne/cm^2 and $15\text{-}35\times10^6$ dyne/cm^2°C, respectively. Annealing of films, deposited on Si, at temperatures in the range 500-700°C does not affect stress in SiN_x. However, stress relief is observed in both undoped and P-doped films of SiO_2. (19 refs.)

68.70 WHISKERS AND DENDRITES: GROWTH, STRUCTURE, AND NONELECTRONIC PROPERTIES

119379 Ion-bombardment-induced whisker formation on graphite. J.A.Floro, S.M.Rossnagel, R.S.Robinson (Dept. of Phys., Colorado State Univ., Fort Collins, CO, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1398-402 (1983).
The bombardment of surfaces with energetic ions has led to the development of various types of surface topography. In one special case, that of graphite, ion bombardment is responsible for the formation of whiskerlike structures. Whiskers formed under ion bombardment exhibit an initial rapid growth process followed by a slower, diffusion-fed process. The rates of lengthening and thickening during the diffusion-fed process appear to be constant in time. Whisker length increases nonlinearly with beam energy; population density decreases as beam energy increases. Whiskers grow parallel to the ion beam. Their alignment is apparently dominated by the destruction of nonparallel whiskers rather than electric field effects. Simultaneous impurity seeding inhibits whisker formation and can totally suppress formation if sufficient flux is present. A growth model involving stress relief at recrystallization front junctures qualitatively fits many experimental observations. (10 refs.)

68.90 OTHER TOPICS IN THE STRUCTURE AND NONELECTRONIC PROPERTIES OF SURFACES AND THIN FILMS

119380 On density profiles of ionic systems near a charged hard wall. M.F.Golovko, O.A.Pizio.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1379-83 (Sept. 1983). In Russian.
Ion density profiles near a charged hard wall are calculated. It is shown that the density profiles with widely ranging density, temperature and electric field intensity on the wall surface can be divided into three regions as to their form: Debye screening, specific ionic ordering, density ordering. Specific features of these regions are investigated in comparison with the ionic system without a wall. (17 refs.)

119381 Condensed states in a system of cluster ions. E.A.Manykin, M.I.Ozhovan, P.P.Poluektov.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1383-8 (Sept. 1983). In Russian.
Metastable condensed states in a system of cluster ions—ions surrounded by a macroscopic shell of a nonpolar fluid with a positive potential barrier at the vacuum-liquid interface—have been studied by means of the density functional theory. Equilibrium parameters are found for the condensed phase: density and binding energy. Lifetime, plasma frequency and surface tension have been estimated. (19 refs.)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

119382 Calculations of the electronic ($4k_F$) and magnetic ($2k_F$) phase transitions from a Hubbard Hamiltonian with an exponentially dependent intersite-transfer integral. H.Th.Jonkman, H.J.Zwinderman, J.Kommandeur (Lab. for Phys. Chem., Univ. of Groningen, Groningen, Netherlands).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1281-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
An exponential intersite-dependence of the transfer integral in the Hubbard Hamiltonian together with $U\gtrsim3t$ in a quarter filled band lead to a separation of the $2k_F$ and $4k_F$ components of the Peierls transition. A phase diagram of the transition temperatures versus U/t can be constructed. The results for some physical properties such as the spin susceptibility can be favorably compared with experiment. (13 refs.)

119383 Electronic polarizabilities of a $^1/_4$-filled extended Hubbard model. D.J.Scalapino (Dept. of Phys. & Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), J.E.Hirsch.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1507-11 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Varying the parameters in an extended Hubbard model leads to four electronic polarizabilities which can influence the lattice dynamics. Of particular interest is the $2p_F$ and $4p_F$ structure of these responses. Using a recently developed Monte Carlo method for the numerical simulation of such systems, the authors have studied the temperature and wave vector dependence of these polarizabilities. Here they present some results for the case of a quarter-filled ($\rho=0.5$) case. (9 refs.)

119384 Transfer integrals for TCNQ salts. G.Janssen, R.Visser, H.Th.Jonkman, J.De Boer, J.Kommandeur (Labs. for Phys. Chem., Univ. of Groningen, Groningen, Netherlands).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1587-91 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Transfer integrals are of prime importance in understanding the physical properties of TCNQ-salts, particularly since the crystal structures vary widely. This paper gives a reliable method of their calculation. (14 refs.)

119385 Improved numerical stability for norm-conserving ion-core pseudopotentials. P.C.Pattnaik (Texas Instruments Inc., Dallas, TX, USA), G.Fletcher, J.L.Fry.
Phys. Rev. B (USA), vol.28, no.6, p.3564-5 (15 Sept. 1983).
Analytic expressions are given for the inverse of the transformation matrix needed to utilize the recently published tables of norm-conserving ion-core pseudopotentials. These expressions eliminate a troublesome numerical instability and should greatly facilitate the use of the tabulated pseudopotentials. (3 refs.)

71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

119386 The energy V_0 of the quasi-free electron in gaseous, liquid and solid methane. U.Asaf, R.Reininger, I.T.Steinberger (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.363-6 (16 Sept. 1983).
Photoinjection experiments show that the energy V_0 of the quasi-free electron in methane is negative at all densities from the dilute gas to the solid with a minimum roughly coinciding with the mobility maximum. The results are in qualitative agreement with the Springett-Jortner-Cohen model (1968) and with Basak and Cohen's (1979) relationship between the mobility and V_0. (22 refs.)

119387 Two-dimensional electron momentum densities in Nb-Mo alloys. Y.Nakao, S.Wakoh (Dept. of Phys., Aoyama Gakuin Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3122-6 (Sept. 1983).
The two-dimensional electron momentum densities in Nb-Mo alloys are calculated on the basis of the average t-matrix approximation scheme. The momentum densities obtained are transformed into the reduced **k**-space by means of the procedure proposed by Lock et al. The authors' results agree qualitatively with the experimental electron-positron pair momentum densities obtained from two-dimensional angular correlation of positron annihilation radiation.

119388 Electronic structure of the 2:1 charge transfer salts of TMTCF. P.M.Grant (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.847-57 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present a unified single-particle model capable of explaining a number of experimental facts pertaining to the high and low temperature/pressure regimes of $(TMTCF)_2X$. Special attention is paid to the nature and source of the interchain interaction in determining the overall physical properties of these materials. (27 refs.)

119389 Short-range Coulomb effects and the chemical systematics of conducting organic charge-transfer salts. A.N.Bloch, S.Mazumdar (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1273-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors show that the effects of short-range Coulomb interactions in molecular organic conductors depend very strongly on band filling because of intermolecular correlations. The entire class of materials thereby falls into a pattern consistent with experimental trends in magnetic susceptibility and $4k_F$ scattering. In the context of a general theory of fractional charge transfer and cohesive energy, a basis for limited chemical control of the short-range interactions is discussed. (17 refs.)

119390 Solitons in nearly commensurate organic charge transfer crystals. A.J.Epstein (Xerox Webster Res. Center, Webster, NY, USA), J.W.Kaufer, H.Rommelmann, J.S.Miller, R.Comes, J.P.Pouget.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1479-85 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
X-ray diffuse scattering, magnetic, and conductivity studies of $(N\text{-methylphenazinium})_x$ $(\text{phenazine})_{1-x}$ (tetracyanoquinodimethane) $[NMP_x (Phen)_{1-x} (TCNQ)]$ show the formation of defect states for $0.50 \lesssim x \lesssim 0.54$. These results are in agreement with the formation of solitons in a highly correlated quasi-one-dimensional system near the quarter-filled-band limit. (32 refs.)

119391 Solitons in quasi one-dimensional crystals. E.M.Conwell, I.A.Howard (Xerox Webster Res. Center, Webster, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1487-92 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors show that the magnitude of the Peierls gap is decreased by the presence of solitons generated thermally or by doping, in highly correlated one-quarter filled band quasi one-dimensional crystals. (20 refs.)

119392 Phase-variable description of solitons in Peierls distorted state. H.Fukuyama (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), J.Hara.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1501-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Simple description of the classification of possible solitons in the dimerized and the trimerized systems is presented in terms of phase variables defined by the bosonization of the interacting fermion fields. (27 refs.)

119393 Domain walls and their properties in quasi-one-dimensional crystals. L.P.Gor'kov, A.G.Lebed (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., Moscow, USSR).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1531-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The three-dimensional features in the electron energy spectrum of quasi one-dimensional (Q1D) conductors strongly favour formation of the soliton-like superstructure in a low temperature phase. The ground state properties reveal unusual behaviour. (15 refs.)

119394 Analytic calculation of the charge distribution around the soliton in the 1D system. I.Batistic (Inst. of Phys., Univ. of Zagreb, Zagreb, Yugoslavia), S.Barisic.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1543-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Solitons in the system with a fractionally filled band are studied within the framework of a continuum model. The variable phase method is employed in order to find the charge, the corresponding charge distribution and the localized state energy of a soliton of an arbitrary shape. (4 refs.)

119395 Electronic structure of soliton-like excitation in 1-D conductors. T.Murao (Dept. of Chem., Faculty of Sci., Kyoto Univ., Kyoto, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1583-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Soliton-like excitations which preserve the charge neutrality are investigated with the model based on the pseudopotential theory. (5 refs.)

119396 Local-density−functional approach to all-trans-polyacetylene. J.W.Mintmire, C.T.White (Naval Res. Lab., Washington, DC, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3283-90 (15 Sept. 1983).
A new first-principles self-consistent computational approach for determining the electronic properties of polymers is presented. The local-density−functional formalism in conjunction with a linear combination of atomic orbitals approximation is used to determine the geometry (by minimizing the total energy within a variational scheme) and electronic structure of periodic chain polymers. This method is applied to all-trans-polyacetylene, and leads to a theoretically calculated geometry, X-ray and ultraviolet photoelectron spectra, and dielectric function $\epsilon(q,w)$ in good agreement with experimentally determined values. (38 refs.)

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

119397 Model calculations on the band structures of one-dimensional mixed donor-acceptor systems. M.C.Bohm (Inst. for Organische Chem., Univ. Heidelberg, Heidelberg, Germany), H.Vogler.
Phys. Rev. B (USA), vol.28, no.6, p.3342-61 (15 Sept. 1983).
The band structures of one-dimensional donor-acceptor (D-A) stacks have been studied by means of the crystal-orbital (CO) formalism based on the tight-binding approximation. The model polymers of the present study are composed of quinhydrone moieties (10 and 11) where the donor and acceptor groups show either a parallel or a perpendicular orientation. These idealized systems have been adopted as models for D-A polymers in the recently synthesized class of D-A phanes. The strength of the D-A interaction has been modified due to alterations of the D-A distances within the unit cells and due to modifications in the effective electronegativity of the active groups (hydroxyl and carbonyl). The computational framework is a semiempirical intermediate neglect of differential overlap (INDO) CO formalism with a variable model Hamiltonian that allowed the simulation of the different types of D-A interactions (weak versus strong D-A pairs). An insulator-metal transition is predicted in the 0° arrangement of 10 for short D-A distances and larger differences in the electronegativities of both fragments. The 90° conformation shows an avoided crossing between the highest filled and the lowest unfilled $\varepsilon(k)$ curves. This leads to a finite band gap for all studied interaction conditions. The band structures, the charge transfer in the D-A stacks, and the excited-state properties of 10 and 11 are analyzed as a function of the D-A geometry (distance, mutual orientation) and as a function of the strength of the D-A pairs. Semiquantitative solid-state models are compared with the INDO CO data, synthetic strategies for the design of D-A phanes with small (vanishing) band gaps are formulated, and various solid-state effects encountered in related low-dimensional D-A systems are briefly discussed. 71.25H Measurement of Fermi surface parameters

(inc. dHvA, magnetoacoustic, position annihilation, and cyclotron resonance studies, etc.)

119398 Dingle temperatures and Fermi surface changes in Cu(H): an application of the impurity cluster formalism. J.Molenaar, A.Lodder (Natuurkundig Lab., Vrije Univ. Amsterdam, Amsterdam, Netherlands).
J. Phys. F (GB), vol.13, no.10, p.2063-75 (Oct. 1983).
The impurity cluster formalism has been extended to describe the scattering of Bloch electrons by a cluster centred around an interstitial impurity. An important feature of this extension is that the host wavefunction coefficients and Green function at the interstitial site can be obtained numerically from their values at the next-neighbouring atoms. The theory has been applied to Cu(H). Calculations of Dingle temperatures x^* and cross-sectional area changes δA reveal that x^* is mainly determined by the hydrogen potential, whereas δA is additionally sensitive to the environment of the hydrogen. The experimental x^* values can be nicely reproduced simulating screening effects by means of a potential shift. Charge neutrality is achieved satisfactorily using a seven-atom cluster which means that the influence of H is not restricted to its own muffin-tin sphere. Because of the sensitivity of δA to charge transfer the merits of the potentials available can be judged to their full extent only if this quantity is measured as well. The effect of lattice

distortion around H appears to be very small. Comparison of calculated and measured anisotropy of x^* confirms that the hydrogen occupies the octahedral and not the tetrahedral interstice in Cu. (13 refs.)

119399 Electronic structure of platinum. A.K.Bordoloi, S.Auluck (Phys. Dept., Univ. of Roorkee, Roorkee, India).
J. Phys. F (GB), vol.13, no.10, p.2101-5 (Oct. 1983).
An attempt is made to obtain a good fit to the Fermi surface of platinum using the interpolation scheme. The starting point is a set of parameters which give a good fit to the optical data. The authors find that it is possible to obtain a good fit to the Fermi surface as well as to the optical data. (11 refs.)

119400 Two-dimensional angular correlation of positron annihilation radiation in paramagnetic chromium. A.K.Singh, R.M.Singru (Dept. of Phys., Indian Inst. of Technol., Kanpur, India).
J. Phys. F (GB), vol.13, no.10, p.2189-96 (Oct. 1983).
Two-photon momentum densities and the two-dimensional angular correlation of positron annihilation radiation (2D ACPAR) in paramagnetic Cr are calculated by using the band-structure method due to Hubbard and Mijnarends (1972). The 2D ACPAR surfaces, $N(p_y, p_z)$, are calculated for four sets of momentum directions with p_x (the axis of integration) along the [110], [111], [100] and [112] directions. The results are presented and are discussed in terms of the contributions from different bands and the topology of the Fermi surface. The results indicate that in the first Brillouin zone the N-centred ellipsoidal hole pockets of paramagnetic Cr give rise to significant structure in the $N(p_y,p_z)$ surfaces. (32 refs.)

119401 The c-axis interaction in $(TMTSF)_2X$. P.M.Grant (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1121-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The c-axis transfer integral is calculated in $(TMTSF)_2ReO_4$ and a value of approximately 1 meV is found. The author compares this result with critical field data and discusses its implications for quantum oscillation measurements and c-axis anion ordering. (8 refs.)

119402 Shubnikov-de Haas oscillations in TMTSF-DMTCNQ. S.Bouffard (Section d'Etude des Solides Irradies, CEN, Fontenay-aux-Roses, France), M.Ribault, D.Jerome, K.Bechgaard.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1437-40 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The observation of Shubnikov-de Haas oscillations in the metallic, high pressure phase of TMTSF-DMTCNQ demonstrates the three-dimensional, closed nature of the Fermi surface. Moreover, the authors discuss the high conductivity of TMTSF-DMTCNQ at low temperature. (8 refs.)

119403 Transport properties and Fermi surfaces in $HfTe_5$ and $ZrTe_5$. M.Izumi, K.Uchinokura (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), R.Yoshizaki, S.Harada, T.Nakayama, A.Yamada, E.Matsuura.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1705-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The Fermi surface of $ZrTe_5$ and $HfTe_5$ below 4.2K is determined by Shubnikov-de Haas oscillation measurement. That is a long cigarette shaped ellipsoid, reflecting quasi-two dimensional character of the crystal. The volume of the ellipsoid is very small, which may be strongly related to the existence of a phase transition or other anomalous properties of these pentatellurides. (9 refs.)

119404 Special points of the Brillouin zone and their use in the solid state theory. R.A.Evarestov, V.P.Smirnov (Dept. of Quantum Chem., Leningrad State Univ., Leningrad, USSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.9-40 (1 Sept. 1983).
Discusses the problem of the Brillouin zone integration in general; the different methods of using plane waves for this integration (so-called 'special point' schemes) are considered and compared with each other. In more detail the large unit cell method is discussed as the most simple and general one. Tables of mean value points and special point sets are given for some two- and three-dimensional crystalline structures. For the first time the dependence of the special point sets on the crystal point symmetry is taken into account, for noncubic lattices the connection of the special point sets with the lattice parameter relation is taken into account based on a simple graphic method. Applications of the special point theory in the calculation of crystalline solids are illustrated. (97 refs.)

119405 Fermi-surface nesting, closed orbits, and the 'threshold field' in an organic superconductor. J.F.Kwak (Sandia Nat. Labs., Albuquerque, NM, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3277-82 (15 Sept. 1983).
The Fermi surface of the organic superconductor $(TMTSF)_2PF_6$ (bis-tetramethyltetraselenafulvalenium hexafluorophosphate) should be open in a one-electron picture. Magnetotransport results, on the other hand, indicate the presence in the metallic state of small closed and compensated orbits. Such orbits can arise if there is an instability of commensurate wave vectors nesting the Fermi surface. The areas calculated here for these orbits are shown to strongly favor nonoptimal nesting over optimal nesting (i.e. the optimal areas are far too small). A model of instability commensuration change at the observed threshold associated with the Shubnikov-de Haas effect, driven by the magnetic field dependence of the Landau-level energies for the optimal orbits, is seen to be consistent with the present results and with many of the novel properties of this material. (35 refs.)

119406 Electron cyclotron absorption in *n*-InSb. A.K.Sharma (Dept. of Phys., Indian Inst. of Technol., New Delhi, India), O.P.Sharma.
Phys. Rev. B (USA), vol.28, no.6, p.3339-41 (15 Sept. 1983).
Following the technique of cyclotron absorption of electromagnetic radiation in relativistic plasmas the authors have studied the phenomenon of electron cyclotron absorption in *n*-InSb where nonparabolicity of the conduction band brings about effects similar to the relativistic effects. For transverse propagation ($\vec{k} \perp \vec{B}_s$) the absorption at low doping levels is considerably due to non-parabolic effects. At oblique angles the Doppler effect prevails over all other effects. For typical *n*-InSb parameters $n \sim 10^{14}$ cm^{-3}, $B_s \sim 5$ kG, $T \sim 77$K, the absorption length for transverse propagation turns out to be approximately equal to 0.2 cm. (6 refs.)

71.25L Electron energy states in liquid metals

119407 Electronic states and conductivity in liquid and amorphous Fe. S.K.Bose, L.E.Ballentine, J.E.Hammerberg (Dept. of Phys., Simon Fraser Univ., Burnaby, Canada).
J. Phys. F (GB), vol.13, no.10, p.2089-99 (Oct. 1983).
The linear combination of atomic orbitals method is applied to clusters of 365 atoms, which are constructed to model the pair distribution functions of liquid and amorphous Fe. From these models the authors compute densities of states, spectral functions and electrical conductivities. Densities of states are quite similar in both models. Some evidence of residual *E-k* dispersion relations is found in the peaks of the spectral functions, but no evidence is found for any negatively sloped portion of the *E-k* curve. Although s states are found to be more mobile than d states, the conductivity is dominated by d states because of their much greater density. (37 refs.)

71.25M Electron energy states in amorphous and glassy solids

119408 Spectral studies on the electronic structure of polyacetylene. J.Tanaka, M.Tanaka, H.Fujimoto, M.Shimizu (Dept. of Chem., Nagoya Univ., Nagoya, Japan), N.Sato, H.Inokuchi.
J. Phys. Colloq. (France), vol.44, no.C-3, p.279-84 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The change of the optical spectra of polyacetylene upon doping is studied by measurements of visible, infrared and photoelectron spectra. The infrared spectra of the doped film showed new peaks with lowering the temperature. (11 refs.)

119409 Elementary excitations of a linearly conjugated diatomic polymer. M.J.Rice (Xerox Webster Res. Center, Webster, NY, USA), E.J.Mele.
J. Phys. Colloq. (France), vol.44, no.C-3, p.393-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Studies the low-lying excitations of a linearly conjugated diatomic polymer. (5 refs.)

119410 Self-consistent crystal potential and band structure of three-dimensional trans-polyacetylene. P.M.Grant, I.P.Batra (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.437-42 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Calculates the three-dimensional band structure of ideally crystalline trans-polyacetylene using a self-consistent pseudopotential technique and have obtained the charge density distribution within the unit cell. The authors find trans-$(CH)_x$ to be highly anisotropic in its one-electron properties and therefore suggest that the interchain soliton/kink interactions might be quite weak. (15 refs.)

119411 Tight-binding studies for electroactive organic polymers. M.L.Elert (Chem. Dept., US Naval Acad., Annapolis, MD, USA), J.W.Mintmire, C.T.White.
J. Phys. Colloq. (France), vol.44, no.C-3, p.451-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A tight-binding model is presented which accurately reproduces the valence band structure of both graphite and diamond. The model is used to calculate the band structure and density of states of polyacetylene, and agreement with experimental XPS results is seen to be excellent. It is suggested that the model should be useful in predicting the valence band electronic structure of a wide range of carbon-based polymers. (15 refs.)

119412 Electronic structure of some conducting polymers. B.R.Bulka (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.459-62 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Using the continued fraction method for a tight binding Hamiltonian, the electronic structure of pure and doped infinite polymer chains as polyheptadiyne, polyphenylene and polythienylene is studied. It is shown that these polymers are semiconductors. There are intramolecular defects, which can hop along a chain. (2 refs.)

119413 Study of disorder in polyacetylene. M.Kabbaj, M.Jestin, J.P.Albert, C.Jouanin (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.463-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Investigates the effects of disorder on the electronic states of polyacetylene. In effect, due to the impurities and variable environment, one would expect some fluctuations in both the self-energies (diagonal disorder) and the hopping integrals (off-diagonal disorder). The consequences of each type of disorder and their relative importance are discussed. (6 refs.)

119414 Electronic correlations and midgap absorption in polyacetylene. Z.G.Soos, L.R.Ducasse (Dept. of Chem., Princeton Univ., Princeton, NJ, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.467-70 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Electronic correlations are important when they lift degeneracies of one-electron models. Spin-independent electron-electron interactions are examined through exact Pariser-Parr-Pople (PPP) analysis of midgap absorption ($E_g/2$) of finite odd polyenes, whose doublet ground state is associated with neutral solitons of Su, Schrieffer, Heeger (SSH). The electronic correlations lift the two-fold degeneracy of the $E_g/2$ absorption and all the dipole intensity goes to the upper state close to E_g while the nondegenerate transition at $E_g/2$ of charged solitons are by contrast insensitive to electronic correlations. Thus, charged solitons dominate the absorption around $E_g/2$. The observed variations of absorption spectra in $(CH)_x$ upon light doping are qualitatively explained by this model. (8 refs.)

119415 Effects of off-diagonal disorder on soliton- and polaron-like states in trans-polyacetylene. C.T.White, M.L.Elert, J.W.Mintmire (Naval Res. Lab., Washington, DC, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.481-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Reports on some exact results the authors have obtained that show off-diagonal disorder can have a significant effect on the Peierls band edges of polyacetylene as well as polaron-like gap states in this system. The results also prove that such disorder leaves many of the more important properties of soliton-like defects largely unaffected. (7 refs.)

119416 Thermal transformation of local to extended electronic states in polyacrylonitrile. J.Fink (Kernforschungszentrum Karlsruhe, Inst. fur Angewandte Kernphys. I, Karlsruhe, Germany), J.J.Ritsko, G.Crecelius.
J. Phys. Colloq. (France), vol.44, no.C-3, p.683-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The electronic structure of pyrolyzed polyacrylonitrile treated at pyrolysis temperatures of 200-600°C has been studied by electron energy loss spectroscopy. (12 refs.)

119417 π electron delocalization in poly-(p-phenylene) (PPP), polyphenylene sulfide (PPS) and polyphenylene oxide (PPO) and AsF_5 doping of PPP. J.Fink, G.Crecelius, J.J.Ritsko, M.Stamm, H.J.Freund, H.Gonska (Inst. fur Angewandte Kernphys. I, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.741-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The relative widths of π bands in poly-(p-phenylene), polyphenylene sulfide and polyphenylene oxide are deduced from electron energy loss experiments. From measurements of the chemical shift of the carbon K absorption edge, the charge on carbon atoms in different coordination is estimated. In AsF_5 doped poly-(p-phenylene) two states inside the gap have been seen, consistent with a bipolar model for the conductivity. (14 refs.)

119418 Trends in optical parameters and band structure with increasing hydrogenation of amorphous silicon. N.Savvides, D.R.McKenzie, R.C.McPhedran (School of Phys., Univ. of Sydney, Sydney, NSW, Australia).
Solid State Commun. (USA), vol.48, no.2, p.189-93 (Oct. 1983).
The authors have studied the optical properties of hydrogenated amorphous silicon films prepared by sputtering a silicon target in an argon/hydrogen plasma and varying hydrogen partial pressure between zero and 0.5 Pa. They report values of the optical constants n and k in the photon energy range 0.5-6.5 eV. The imaginary part of the dielectric constant ϵ_2 and the effective number of valence electrons per silicon atom n_{eff} are deduced. They are used to obtain qualitative information on the band structure as a function of hydrogen partial pressure. Low to intermediate pressure films show properties consistent with hydrogen compensating dangling bonds and a general reduction in disorder in the films. High pressure films show abnormal changes in the ϵ_2 spectra and n_{eff} which are interpreted as evidence of H-induced defects in the gap and broadening of the valence band tail. Overall the observations are consistent with a recently proposed two-phase model for Si-H alloys. (24 refs.)

119419 Band structure of nonclassical polymers. N.Tyutyulkov (Inst. of Organic Chem., Acad. of Sci., Sofia, Bulgaria), P.Schuster, O.Polansky.
Theor. Chim. Acta (Germany), vol.63, no.4, p.291-304 (1983).
It is shown that fully conjugated alternant nonclassical polymers are comparatively stable systems as a result of the considerable delocalisation energy. The energy characteristics of the polymers are strongly determined by the electron spin distribution of the degenerate nonbonding molecular orbitals; the full spin configuration, $S>0$, is favoured. The spin densities depend on the electron correlation and alternate; this corresponds to a ferrimagnetic state of the polymer at 0K. (23 refs.)

119420 Electronic structure and bonding in transuranics: comparison with lanthanides. J.W.Ward (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.279-92 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The physicochemical properties of actinide metals beyond uranium and their alloys and compounds show interesting parallels and contrasts with the rare earths. At first there is a transition region where the unique bonding properties of the early actinides become less prominent owing to progressive f electron localization. Nevertheless, in contrast with the rare earths, the f electron energies remain close to the Fermi level, resulting in complex behavior as a function of temperature, pressure and structure. Particularly interesting in this region are the metallic hydrides, whose chemistry is clearly rare earthlike but whose electronic properties are entirely different. At americium a major localization and f band narrowing occurs, but the explanation of americium behavior is obscured by the occurrence of this unique f^6 non-magnetic solid state configuration. Beyond americium, it would appear that real rare-earthlike behavior finally begins; this has been borne out by recent studies on the thermodynamics and cohesive energies of curium, berkelium, californium and einsteinium metals. However, a new complication arises almost immediately in the onset of incipient stabilization of the divalent state, which first appears in californium, whose physicochemical properites are remarkably similar to those of samarium. Einsteinium appears to be fully divalent, thus heralding the beginning of a mini series of truly divalent metals. (34 refs.)

119421 Split-off narrow d-band states above E_F in transition-metal alloys. F.U.Hillebrecht, J.C.Fuggle, G.A.Sawatzky, R.Zeller (Inst. fur Festkorpersforschung, KFA Julich GmbH, Julich, Germany).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1187-90 (26 Sept. 1983).
The presence is shown of narrow early-transition-metal d bands in the unoccupied states, sometimes several electronvolts above the occupied states, in alloys of early with late transition metals. The widths of these states are small if the early-transition-metal concentration and the host density of states above E_F are both low. Their relationship to the narrow resonances of impurities in metals and their possible relevance to optical properties are discussed. (22 refs.)

119422 Generalized theory of neutron scattering from hydrogen in metals. R.C.Casella (Nat. Measurement Lab., NBS, Washington, DC, USA).
Phys. Rev. B (USA), vol.28, no.6, p.2927-36 (15 Sept. 1983).
A recent analysis by the author of inelastic scattering of neutrons from dilute hydrogen in metals in terms of coherent itinerant-proton energy bands is generalized to include incoherent processes such as the spontaneous decay of the proton from excited-oscillator states to the ground state, as well as incoherent hopping among excited local-oscillator states centered at neighboring interstitial occupancy sites. Similarly, the analysis of Chudley and Elliott of quasielastic neutron scattering and its extension by Row, Skold, Flowtow, and Rush are generalized to include coherent hopping (band transport) in the self-correlation function describing motion of the proton among neighboring oscillator ground states (and, when applicable, among excited states). The general formalism developed here encompasses quasielastic and inelastic scattering and allows for the coexistence of coherent and incoherent processes. At each level of complexity, the expressions obtained for the cross sections are shown to reduce to earlier results in the limits when either the coherent or the incoherent contributions to the neutron bandwidths can be ignored. (18 refs.)

119423 Electron structure of transition-metal alloys with arbitrary far order. V.E.Egorushkin, A.I.Kul'ment'ev (V.D. Kuznetsov Siberian Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.12, p.1093-111 (Dec. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.12, p.29-49 (Dec. 1982). [received: Oct. 1983]
The generalization of multiple scattering formalism permits calculation of the electron energy spectrum and state density in binary alloys of transition elements with arbitrary far order. Calculations performed for the ordered alloy FeCo show that the method can be used successfully for study of real systems of this type. The features of electron subsystem evolution with change in order completely determine the character of the order-disorder phase transition. (52 refs.)

119424 Electronic structure of transition metals under pressure. N.I.Kulikov (Inst. of High-Pressure Phys., Acad. of Sci., Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.12, p.1112-22 (Dec. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.12, p.50-62 (Dec. 1982). [received: Oct. 1983]
The author demonstrates the advances made in the intensive study of the behavior of the electronic structure of metals under pressure in recent years. The alloys of transition metals, including intermetallic ordered compounds, have for the time being proved to lie outside the scope of this review, mainly because of the lack, in practice, of theoretical calculations in this area. Clearly, progress in this field is also being held up by the lack of detailed experimental investigations devoted to the behavior of alloys under pressure. This is due to the complexities involved in carrying out many traditional experimental procedures under high pressures. (56 refs.)

119425 Electron configuration and X-ray emission spectra of intermetallic compounds with CsCl structure. V.V.Nemoshkalenko, V.N.Antonov (Inst. of Metal Phys., Acad. of Sci., Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.12, p.1135-48 (Dec. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.12, p.79-94 (Dec. 1982). [received: Oct. 1983]
The different compounds with CsCl structure possess a whole series of unique properties: elevated hardness, a magnetic properties, high melting point, properties associated with the shape memory effect, etc. This attracts the persistent attention of researchers to an experimental and theoretical study of the electron configuration of these compounds since the electron subsystem precisely determines their physical properties to a significant degree. Moreover, compounds with the CsCl structure have a comparatively simple crystalline structure, which facilitates the construction of theoretical models to describe their physical properties. The authors select for the analysis just certain of the most interesting, theoretical investigations and pay special attention to those in which a comparison is made with X-ray emission spectra. Such a selection is explained by the fact that the X-ray emission spectrum is one of the most effective direct methods of studying the electron configuration of solids. X-ray emission spectra carry information about the energetic distribution of the electrons of different symmetry over the whole width of the valence band and can be a criterion for the correctness of the theoretical computations. (67 refs.)

119426 Relation between the electronic states and structural properties of $Hg_{1-x}Cd_xTe$. A.-B.Chen (Phys. Dept., Auburn Univ., Auburn, AL, USA), A.Sher, W.E.Spicer.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1674-7 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Physical reasons are presented for the coherent potential approximation (CPA) calculation method's ability to predict little band-gap bowing or alloy scattering, while at the same time predicting large deviation from virtual crystal behavior in other energy ranges. Accurate treatment of structural properties requires that calculations be doubly self-consistent: a density functional method plus CPA is needed. Experimental values of bond energies are greater than those predicted by simple theories. Weakened HgTe bonds in alloys help to explain the loss of Hg when the materials undergo surface treatments. (15 refs.)

119427 Empirical tight binding description of $Hg_{1-x}Mn_xTe$ and $Hg_{1-x}Cd_xTe$. K.C.Hass, H.Ehrenreich (Dept. of Phys., Harvard Univ., Cambridge, MA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1678-82 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Presents the first theoretical treatment of the electronic structure of $Hg_{1-x}Mn_xTe$. As in the authors' previous work on $Hg_{1-x}Cd_xTe$, a semiempirical tight binding approach is employed, based in part on atomic energy levels. Harrison's universal tight binding scheme, and existing experimental band structure information. The occupied Mn spin-polarized *d* bands are discussed and shown to have little effect on the states near the band edges. The *s-p* electron 'complex band structure' of $Hg_{1-x}Mn_xTe$ is calculated in the CPA. Previous results for $Hg_{1-x}Cd_xTe$ are extended and used as a basis of comparison. The more rapid increase of the band gap with x in $Hg_{1-x}Mn_xTe$ is shown to result from the larger energy difference between cation *s* levels. This difference also gives rise to more pronounced disorder effects in $Hg_{1-x}Mn_xTe$. These are discussed in the context of the CPA results for damping, band gap bowing, and the limiting electron mobilities. (31 refs.)

119428 Band gap variation and lattice, surface, and interface 'instabilities' in $Hg_{1-x}Cd_xTe$ and related compounds. W.E.Spicer, J.A.Silberman, I.Lindau (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA), A.-B.Chen, A.Sher, J.A.Wilson.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1735-43 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The authors bring into focus the differences between $Hg_{1-x}Cd_xTe$ (MCT) and 'ordinary' semiconductors such as column 4, 3-5, and most 2-6 compounds. The key characteristic of MCT which makes it both different and of practical interest is the variation of band gap with composition (0 to 1.5 eV). The same unusual characteristic of the Hg atomic states which leads to the advantageous movement of band gap with composition weakens the bonding of Hg in the lattice. This bonding weakness exhibits itself in many ways in the characteristics of MCT, both at surfaces and interfaces and in the bulk. Because of this there is a potential instability associated with the surface or interface; however, this instability depends critically on the crystalline perfection of the MCT to depths far below the surface. The reason for this is defects move from the bulk to the surface (or in the opposite direction) with surprising ease—even at room temperature. The extreme susceptibility of MCT to mechanical damage is also related to the weakness of the Hg bonding. A first attempt is made at showing how the Hg bonding affects the electronic structure, lattice bonding, and defect structure of MCT. A key phenomenon in the electronic structure is the breakdown of the virtual crystal potential approximation. This breakdown is selective and involves only those valence states near zone boundaries containing large cation *s* wave function admixtures. This again reflects the unusual character of the Hg atomic 6 s^2 valence state. (30 refs.)

119429 Energy band structure and electronic transport properties of niobium monoxide. W.E.Wahnsiedler (Alcoa Tech. Center, PA, USA).
J. Solid State Chem. (USA), vol.49, no.2, p.195-205 (Sept. 1983).
The energy band structure of niobium monoxide was calculated by augmented plane wave techniques including detailed calculations of the potential between APW spheres in the lattice. Predictions of isotropic electronic transport parameters were made from the band structure. The results yielded a density of states which was compatible with the X-ray photoelectron spectrum of the material. The band structure was consistent with a material with highly metallic properties. The work function was calculated as 9.4 eV, larger than observed. This difference may be due to an assumed one-electron charge transfer between the Nb and O APW spheres. Hall coefficients calculated from the band structure fell within observed ranges, but transverse magnetoresistances were larger than observed. A variety of possible phenomenon were advanced to account for this discrepancy. (31 refs.)

119430 Band structure of $TlGaSe_2$. S.G.Abdullaeva, N.T.Mamedov, G.S.Orudzhev (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.41-8 (1 Sept. 1983).
A mode of the $TlGaSe_2$-I band structure of the monoclinic modification is proposed. The monoclinic modification of $TlGaSe_2$-I is considered as a deformed tetragonal one. The band structure of the metastable tetragonal modification of $TlGaSe_2$-II is calculated by the pseudopotential method. The irreducible representations of the $D_{4h}{}^{18}$ group ($TlGaSe_2$-II) are expanded in irreducible representations of the $C_s{}^4$ group ($TlGaSe_2$-I). It is found that the top of the valence band is located at the point Y $(0,2\pi/b_m,0)$ of the $TlGaSe_2$-I Brillouin zone and is formed from band states N_2, N_4 of the tetragonal modification. The bottom of the conduction band is located at the point Γ of the $TlGaSe_2$-I Brillouin zone and is formed from T_4 states. An additional extremum of the valence and conduction bands is located at the points $\Gamma(A_2)$ and $Y(N_6,N_8)$, respectively. An interpretation of the absorption spectra of $TlGaSe_2$-I near the fundamental edge is proposed. (13 refs.)

119431 Experimental band structure of cadmium sulfide. N.G.Stoffel (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3306-19 (15 Sept. 1983).
The author has investigated the bulk electronic structure of wurtzite CdS using angle-resolved photoelectron spectroscopy with synchrotron radiation. He finds that direct transitions largely determine the shape of the experimental spectra. Information from all high-symmetry points in the Brillouin zone is available from normal- and off-normal-emission spectra with the aid of polarization selection rule. A comparison with experimentally determined critical-point energies shows that existing theoretical band-structure calculations for wurtzite CdS are qualitatively correct, but underestimate the extent of the band dispersion. For example, he observes an upper-valence-band width of 4.5 eV, which is significantly larger than the predicted values of 2.7-3.3 eV. The spectra also reveal fine structure in the Cd4*d* core-level spectra. This suggests that the Cd4*d* electrons are involved in the chemical bonding. (55 refs.)

119432 Site inequivalence in $Fe_{1+x}Nb_{3-x}Se_{10}$. G.K.Wertheim, F.J.DiSalvo, D.N.E.Buchanan (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3335-8 (15 Sept. 1983).
$Fe_{1+x}Nb_{3-x}Se_{10}$ has a novel structure made up of trigonal prismatic and octahedral coordinated metal atoms. The Se atoms are of two major types, those bound in Se pairs and single Se atoms, and while only Nb cations are found on the trigonal sites and the Fe (along with the remaining Nb) is found on the octahedral sites. To permit the study of the effects of disorder and site inequivalence on the electron structure of this compound, the X-ray photoelectron spectra of the core and valence electrons were examined. The spectra show two distinct types of Se. The relative intensities of the two Se spectra and comparisons with the spectra of related compounds identify the Se at greater binding energy with the closely spaced Se pairs in the trigonal chains and those at smaller binding energy with the rest of the Se atoms. The spectra of the Nb atoms in the two different sites were not resolved and differ by not more than 0.2 eV in binding energy. However, the Nb3*d* spectra showed more broadening than in similar compounds, probably due to the Nb site inequivalence and disorder intrinsic to the octahedral chains. All Nb atoms are consequently chemically similar. Chemical shifts indicate an oxidation state for Nb in $Fe_{1+x}Nb_{3-x}Se_{10}$ between those of $NbSe_2$ and $NbSe_3$. The spectra of the Fe atoms were relatively broad, and showed no resolved structure. These results are consistent with a recent semiempirical tight-binding band calculation which suggests that the conduction-electron density is low and resides mainly on the trigonal prismatic chain.

119433 Electronic structure and X-ray near-edge core spectra of Cu_2O. J.Robertson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3378-85 (15 Sept. 1983).
A new tight-binding band structure of Cu_2O is presented from a fit to the valence-band density of states and low-energy band gaps. The depths of core excitons and the near-edge structure of the O K edge are calculated using the $Z+1$ approximation to the core-hole potential and the local density of states of the excited atom. The chemical trends of its impurity level are predicted and partial densities of states are found. (24 refs.)

119434 Electronic structure and optical properties of solid methane. A.B.Kunz (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3465-73 (15 Sept. 1983).
The electronic structure of solid methane, including the virtual levels is studied in a self-consistent Hartree-Fock model as a function of the lattice constant. It is found that the band gap is a sensitive function of pressure. It is also found that the resulting accuracy of the conduction bands depends heavily upon the quality of the virtual orbitals, a fact not appreciated in previous studies on solid CH_4. It is found essentially to include correlations explicitly in order to facilitate a comparison to experiment. This is done by means of perturbation theory. The inclusion of Coulomb correlations causing the formation of excitons in the excited spectra is accomplished by means of degenerate perturbation theory in the continuum. Results are compared to experiment. (23 refs.)

119435 Band structure, spontaneous polarization and index of refraction above and below the Curie point of $BaTiO_3$ and $KNbO_3$. L.Castet-Mejean (Lab. de Phys. Electronique, Univ. Lyon I, Villeurbanne, France).
Solid State Commun. (USA), vol.48, no.4, p.385-7 (Oct. 1983).
The spontaneous polarization influence on the refractive index of $BaTiO_3$ and $KNbO_3$ perovskites is analysed from their band structure. The coupling effects between the conduction band edge and the spontaneous polarization are expressed through the Bloch orbital interactions and allow one to interpret the presence of a precursor polarization in the paraelectric phase and the refractive index experimental data. (10 refs.)

119436 Theoretical and experimental investigation of the optical properties of mixed-valence compound SmB_6. O.V.Farberovich, S.I.Kurganskii, K.K.Sidorin, M.G.Karin, V.N.Bobrikov, G.P.Nizhnikova, A.I.Shelykh, M.M.Korsukova, V.N.Gurin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.404-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.708-14 (March 1983). [received: Oct. 1983]
A modified variant of the orthogonalized plane wave method is used to calculate the energy band structure of SmB_6, which is a mixed-valence compound. A histogram of the interband density of states $I(\omega)$ is plotted and the first order of perturbation theory is used to calculate the multiplet structure of the perturbed configuration f^4d. Measurements are reported of the optical reflection spectrum of samarium hexaboride in a wide energy range from 0.05 to 40 eV. The Kramers-Kronig relationships are used to find the spectrum of the imaginary part of the permittivity ϵ_2 and its interpretation is based on the theoretical function $I(\omega)/\omega^2$ and on the multiplet structure of the excited configuration f^4d. 71.30 METAL-INSULATOR TRANSITIONS

119437 Structural energy and stability condition of the Peierls state. T.Murao (Dept. of Chem., Kyoto Univ., Kyoto, Japan), Y.Nagaoka.

J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2976-8 (Sept. 1983).

The structural energy associated with the Peierls instability in 1-D conductors can be expressed as $\delta U = cA^2 + dA^2$, A being the order parameter. Because of the dependence of c on the Peierls-gap, the minimized δU still has the quadratic term of A in addition to the usual quartic term. The occurrence of Peierls transition still depends on the balance between the band-structure term and the electrostatic term in the pseudopotential theory.

119438 Theory of anion ordering in TMTSF compounds. R.Bruinsma (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), V.J.Emery.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1115-20 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

A strong coupling theory is developed for anion ordering in $(TMTSF)_2X$, where X is a tetrahedral anion. The effect of pressure is considered and an explanation is found for the thermal cycling effects in $(TMTSF)_2ClO_4$ and $(TMTSF)_2ReO_4$. (12 refs.)

119439 Suppression of the Peierls transition by chemical modification. G.Saito, T.Enoki, H.Inokuchi (Inst. for Molecular Sci., Okazaki, Japan), H.Kobayashi.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1215-18 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

In an organic cation radical salt, [bis(ethylenedithiolo)tetrathiafulvalene]$_2$ClO$_4$[1,1,2-trichloro-ethane]$_{0.5}$, a remarkable suppression of metal to semiconductor transition is achieved and a quasi metallic character is observed down to 1.4K. The electrical, optical, and structural data show this salt is almost two-dimensional (2D). The authors propose practical molecular designing of organic metals with strong interchain interaction, which possibly become organic superconductors of the $(TMTSF)_2X$ type. (17 refs.)

119440 Diffuse X-ray studies of the Peierls and the spin Peierls transitions in TMTTF-TCNQ and TMTTF-bromanil. S.Kagoshima (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), H.Anzai.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1289-94 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Structural phase transitions found in quasi one-dimensional conductors TMTTF-TCNQ and TMTTF-bromanil are characterized as the Peierls and the spin-Peierls transitions, respectively. Differences of properties between these two compounds are discussed. (23 refs.)

119441 Phase transitions in TMAITCNQ by resonance Raman spectroscopy. A.D.Bandrauk, K.D.Truong, C.Carlone, S.Jandl (Groupe de Recherches sur les Semiconducteurs et Dielectriques, Faculte des Sci., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1473-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Measurements of Raman linewidths, frequencies and intensities of the ν_1 symmetric mode of $I^{-}{}_3$ are presented as a function of temperature and are correlated with various degrees of participation of the iodine chains in the phase transitions of TMA I TCNQ. (14 refs.)

119442 On the possibility of two phase transitions in HMTTF-TCNQ. J.Solyom (Central Res. Inst. for Phys., Budapest, Hungary).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1569-72 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

It is shown by using symmetry considerations in the framework of the Landau theory that HMTTF-TCNQ can undergo two subsequent phase transitions even though there is a single charge density wave in the system with temperature independent wave vector. (7 refs.)

119443 Metal-insulator transition in incommensurate Peierls chains by extinction of the Frohlich conductivity. P.Y.Le Daeron, S.Aubry (Lab. Leon Brillouin, CENS, Gif-sur-Yvette, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1573-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

A new metal-insulator transition with respect to the electron-phonon coupling is investigated in one-dimensional incommensurate conductors. This transition is essentially due to the competition between the Fermi and the lattice periods. (7 refs.)

119444 Scaling behavior near the pinning transition of the discrete Frenkel-Kontorova model. S.N.Coppersmith (Bell Labs., Murray Hill, NJ, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1579-82 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The discrete Frenkel-Kontorova model, used to study a one-dimensional solid in a periodic potential is examined in the incommensurate region. The behavior of the system near the transition from an unpinned to a pinned phase (first discussed by Aubry) is investigated. A disorder parameter and a correlation length are defined and shown numerically to obey scaling relations on both sides of the transition. (7 refs.)

119445 Erasable optical switching in semiconductor organic charge-transfer complexes. R.S.Potember, R.C.Hoffman, R.C.Benson, T.O.Poehler (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1597-604 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Semiconducting organo-metallic films such as silver and copper tetracyanoquinodimethane (TCNQ) have been observed to switch between two stable states when exposed to optical radiation. Observations of switching between two states in these films have been made by Raman spectroscopic methods and electrical resistance changes. Line or pattern generation is observed for exposure above certain threshold levels. Results of the spectral response and power density dependence on the optical switching threshold are also presented. These results are interpreted in light of activation energy and optical absorption spectra measurements and the proposed mechanism of electric field effect switching in these organic materials. (16 refs.)

119446 Charge density wave dynamics in the incommensurate and commensurate TaS_3. P.Monceau, H.Salva, Z.Z.Wang (Centre de Recherches sur les Tres Basses Temperatures, CNRS, Grenoble, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1639-45 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

TaS_3 crystallises in two structures with an orthorhombic and monoclinic unit cell. These two compounds undergo Peierls transitions: the orthorhombic one at $T_0=212K$ and the monoclinic one, which is isotypic with $NbSe_3$, shows two independent transitions at $T_1=240K$ and $T_2=160K$, incommensurate with the lattice and with a temperature independent periodicity slightly above and below four lattice constants along the chain axis. The authors have measured electrical resistivity, the depinning electric field, the fundamental frequency in the noise between the voltage leads for both compounds as a function of the temperature. These measurements and electronic microscope diffraction patterns clearly indicate an incommensurate-commensurate transition at $T_0'=140K$ for the orthorhombic TaS_3. The current carried by the CDW varies linearly with the fundamental noise frequency. The different models for the extra-conductivity will be reviewed. (19 refs.)

119447 Electric field induced structural changes in $NbSe_3$?. R.M.Fleming, C.H.Chen, D.E.Moncton (Bell Labs., Murray Hill, NJ, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1651-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The authors present a study of the charge-density wave (CDW) coherence and a search for possible electric field induced structural changes of the CDW in $NbSe_3$. Results from both synchrotron X-ray scattering and dark-field electron microscope images are presented. They find from synchrotron scattering that the CDW exhibits long range order. They find no apparent field-induced changes of the CDW either in the synchrotron results or the dark-field images. (14 refs.)

119448 New results obtained by electron diffraction on the one-dimensional conductors TaS_3 and NbS_3. C.Roucau (Lab. d'Optique Electronique, CNRS, Toulouse, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1725-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

By using electron diffraction on orthorhombic TaS_3, the author has investigated the variation with temperature of the distortion wave vector associated with a charge density wave. This compound undergoes an incommensurate-commensurate transition which is observable by transport measurements at 130K. The results he obtained on the variety II of NbS_3 led him to propose new lattice parameters for this material. Moreover, he determined the components of the wave vectors of the two lattice distortions which are present at room temperature. (8 refs.)

119449 X-ray observation of 1-D precursor effects in $NbSe_3$ and new diffuse scattering features in $FeNb_3Se_{10}$. J.P.Pouget, R.Moret, A.Meerschaut, L.Guemas, J.Rouxel (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1729-31 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Two sets of diffuse sheets perpendicular to the chain direction have been observed at different wave vectors in $NbSe_3$. They clearly reveal the presence of quasi-one-dimensional fluctuations above the phase transitions of this compound. New diffuse scattering features have been also observed in $FeNb_3Se_{10}$. (11 refs.)

119450 Switching and hysteresis in $NbSe_3$. G.Gruner, A.Zettl (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1745-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The authors have studied the hysteretic 'switch' associated with the development of the current-carrying charge density wave (CDW) state in $NbSe_3$, and find evidence for an intermediate 'fibrillating' state. The switch itself may be associated with a finite time required to couple various CDW regions, thus forming a coherent current-carrying state. (17 refs.)

119451 Characterization of the CDW transition in orthorhombic TaS_3 by thermoelectric power and magnetic susceptibility measurements. D.C.Johnston, J.P.Stokes, Pei-Ling Hsieh, G.Gruner (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1749-52 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The magnetic susceptibility (4-340K) and thermoelectric power (50-300K) of orthorhombic TaS_3 are reported. The Peierls transition at $T_p=215K$ manifests itself as a peak in the temperature derivative of both quantities. These measurements indicate that strong one dimensional fluctuations occur well above T_p, that the compound is a wide-band ($\simeq 5$ eV) metal at $\gtrsim 300K$, and that Coulomb correlations are not important in determining the electronic properties of this material. (8 refs.)

119452 Effect of disorder on the charge density wave transitions and transport in orthorhombic TaS_3. Pei-Ling Hsieh, F.de Czito, A.Janossy, G.Gruner (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1753-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Temperature and electric field dependent conductivity studies are reported on alloys of orthorhombic TaS_3 with Nb and Se. The Peierls transition is depressed and also broadened by impurities. The threshold electric field for the onset of nonlinear conduction E_T is proportional to the square of the impurity concentration. (11 refs.)

119453 Peierls transition in the quasi-one dimensional blue bronzes $K_{0.30}MoO_3$ and $RbO_{0.30}MoO_3$. C.Schlenker, C.Filippini, J.Marcus, J.Dumas (Groupe des Transitions de Phases, CNRS, Grenoble, France), J.P.Pouget, S.Kagoshima.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1757-60 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Transport and X-ray diffuse scattering studies on the blue bronzes $K_{0.30}MoO_3$ and $Rb_{0.30}MoO_3$ show that the semiconductor to metal transition at 180K is of Peierls type. Nonlinear conductivity observed in the incommensurate semiconducting phase is attributed to the sliding of the charge density waves. (10 refs.)

119454 Two CDW's locking model in orthorhombic TaS_3. M.Renard, Z.Z.Wang (Centre de Recherches sur les Basses Temperatures, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1761-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Contrarily to $NbSe_3$ or monoclinic TaS_3, the orthorhombic variety of TaS_3 has a single CDW transition. The CDW wave vector is a function of T and becomes commensurable at $T_0=130K$. The authors propose a model based on the locking of two waves with a single wave vector and a single order parameter, to give an account of both crystallographical and nonlinear transport phenomenas. (8 refs.)

119455 Metal-insulator transition and scaling for incommensurate systems. M.Kohmoto (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1198-201 (26 Sept. 1983).
Tight-binding models in one dimension with incommensurate potentials are studied. For the sinusoidal-potential model scaling of the spectrum is found numerically at the critical point, which separates the region where all the states are extended and the region where all the states are localized. Absence of scaling for generic potentials indicates the existence of mobility edges. An index δ, which characterizes the behavior of the total width of allowed energies, is defined at the critical point. For a class of discontinuous potentials, the systems are found to be always critical. (20 refs.)

119456 Optical study of electron localization approaching a polarization catastrophe in liquid K_x-KCl_{1-x}. W.Freyland, K.Garbade, E.Pfeiffer (Phys. Chem., Philipps-Univ. Marburg, Marburg, Germany).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1304-6 (3 Oct. 1983).
The absorption constant $K(\nu)$ and refractive index $n(\nu)$ have been measured at photon energies of $0.5 \leq h\nu \leq 5.5$ eV in liquid K_x-KCl_{1-x} solutions for $0.001 \leq x \leq 0.05$ and temperatures up to 900°C, approaching the metal-nonmetal transition. The absorption spectra give clear evidence for F-center states existing at all x in equilibrium with aggregated centers, probably small metal clusters. The dielectric susceptibility increases with x by almost 2 orders of magnitude. A fit of the dielectric enhancement by a critical form yields a critical exponent, $\zeta=1.4\pm0.2$. (14 refs.)

119457 Peierls and spin-Peierls phase transitions in systems with coupled softening modes. Y.Lepine (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada).
Phys. Rev. B (USA), vol.28, no.5, p.2659-67 (1 Sept. 1983).
Peierls and spin-Peierls-type phase transitions are studied in quasi-one-dimensional systems where the distortion of the lattice is described by more than one normal mode. A model is chosen to describe this situation in the case of two coupled normal modes. A possibility of intrinsic structural instability is also included. A mean-field treatment is effected for a three-dimensional lattice and the following results have been obtained as a function of Γ, the strength of the coupling between the two normal modes: (1) the distortions corresponding to each normal mode occur at the same temperature, i.e. the transition temperature is unique; (2) the transition temperature increases when Γ decreases; finally, (3) for negative coupling energies ($\Gamma<0$) there exists a value of Γ_c, of Γ, such that for $\Gamma<\Gamma_c$ the transition is of first order and for $\Gamma>\Gamma_c$ the transition is of second order. This model is applied to the alkali-metal tetracyanoquinodimenthanide salts. It is found that, qualitatively, the dependence of the transition temperature on cation size and the order of the phase transition can be adquately understood in terms of the present model. (25 refs.)

119458 Self-consistent scaling theory of the metal-insulator transition in disordered systems. Y.Gefen (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel), Y.Imry.
Phys. Rev. B (USA), vol.28, no.6, p.3569-72 (15 Sept. 1983).
The authors propose a self-consistent description of the diffusion of electrons dressed by the Coulomb exchange interactions in a disordered system, as the metal-insulator transition is approached from the metallic side. The critical anomalies of the single-particle density of states and dielectric function are evaluated each in terms of the other. New scaling laws between the critical behaviors of these quantities as well as the diffusion constant and the frequency-dependent conductivity are obtained. It is argued that the density of states which appears in the expressions for the conductivity and the dielectric function becomes the anomalous one for frequencies higher than some relaxation rate of the many-body system. (25 refs.)

71.35 EXCITONS AND RELATED PHENOMENA

(inc. electron-hole drops)

119459 Triplet excitons in MEM$(TCNQ)_2$. S.Oostra, P.de Lange, R.J.J.Visser (Lab. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1383-5 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
In the ESR spectrum of MEM$(TCNQ)_2$ at low temperature, three pairs of triplet lines have been observed. Their dipolar splitting is fairly small. These lines either occur because the $2k_F$ distortion in MEM$(TCNQ)_2$I is so small or because coupled spins are observed on neighbouring chains. (4 refs.)

119460 Biexcitons in crystals with large ortho—para-exciton splitting. A.I.Bobrysheva, S.A.Moskalenko (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.141-6 (1 Sept. 1983).
It is shown that in a system of ortho- and para-excitons two ortho-excitons with total spin $S=0$ interact attractively and biexcitons can be formed. The interaction potential of two ortho-excitons is approximated by a generalized Morse potential depending on the electron-hole mass ratio σ. On this basis the energy of vibrational and rotational levels of the biexciton is obtained. The binding energy of the biexciton ground state is estimated for all values of σ. (9 refs.)

119461 New approach to the exciton-phonon problem. A.Oswald (Inst. fur Festkorperforschung, Kernforschungsanlage Julich, Julich, Germany), I.Egri.
Phys. Rev. B (USA), vol.28, no.6, p.3291-9 (15 Sept. 1983).
With the use of the equation-of-motion method for electron-hole pairs, the influence of a phonon field on both gap energy and exciton energy is studied for finite temperatures. Free- and bound-polaron corrections as well as nonlocal, dynamic, phonon-mediated electron-hole interaction are obtained. These are evaluated analytically assuming parabolic bands, dispersionless optical phonons, and a hydrogenic 1s wave function for the exciton. Numerical variation with respect to the Bohr radius yields the exciton energy. For zero temperature, the resulting binding energy agrees well with other theories and experimental values for a number of direct-band gap cubic materials. (22 refs.)

119462 Self-trapped exciton and rare-gas impurity centers in solid Ne. C.H.Leung (Div. of Sci., Univ. of New Brunswick, Saint John, New Brunswick, Canada), L.Emery, K.S.Song.
Phys. Rev. B (USA), vol.28, no.6, p.3474-81 (15 Sept. 1983).
The structure of the atomic-type self-trapped exciton in solid Ne is studied using a hybrid method in which the inner shells of an atom are represented by the ion-size parameters of Bartram, Stoneham, and Gash (1968), while the two outermost s,p shells are treated exactly as in the extended-ion model. The electronic wave function and the lattice relaxation are determined self-consistently by minimization of the total energy of the system. The lattice is found to dilate around the excited Ne atom by an amount corresponding to about five vacancies. The calculated absorption energy of the self-trapped exciton for $\Gamma_1 \rightarrow \Gamma_{15}$ (atomic $3s \rightarrow 3p$) transition is in good agreement with the experimental data of Suemoto and Kanzaki (1980, 1981). The impurity centers of rare-gas atoms in a Ne host are also studied by the same method. The results show the existence of a small cavity around the impurity atoms, and account satisfactorily for the changes in the optical transition energies from gas to solid. (27 refs.)

119463 Strain confinement and thermodynamics of free excitons in a direct-gap semiconductor. D.P.Trauernicht, A.Mysyrowicz, J.P.Wolfe (Phys. Dept., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3590-2 (15 Sept. 1983).
Long-lived paraexcitons have been confined by a strain-induced parabolic potential well in Cu_2O. The excitons are found to behave as a highly diffusive classical gas at the crystal lattice temperature, as determined from their spatial and energy distributions between 1.5 and 4.2K. Strain confinement and spatially selective resonant excitation provide a new method for examining the thermodynamics and interparticle kinetics of this direct-gap exciton. (7 refs.)

119464 Two-dimensional electron-hole system in a strong magnetic field. Yu.A.Bychkov, E.I.Rashba (L.D. Landau Inst. for Theoretical Phys., Moscow, USSR).
Solid State Commun. (USA), vol.48, no.4, p.399-402 (Oct. 1983).
A theory of a 2-D e-h system in a strong magnetic field is presented. Its properties drastically depend on the existence of the e-h symmetry in it. In an asymmetric system excitons interact with each other and as a result can form magnetic biexcitons. The system is unstable to the formation of a charge-density waves (CDW) at low temperatures. (8 refs.)

119465 Investigation of the structure of many-particle exciton-impurity complexes bound to phosphorus atoms in silicon. A.S.Kaminskii, V.A.Karasyuk, Ya.E.Pokrovskii (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1295-1303 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2237-51 (Dec. 1982). [received: Oct. 1983]
The fine structure of no-phonon luminescence lines α_m (m is the number of bound excitons) due to many-particle exciton-impurity complexes bound to phosphorus atoms in silicon was investigated experimentally and theoretically. The fine structure was calculated for an excited state of a bound exciton ignoring the interaction with an inner-shell electron Γ_1, even in the presence of uniaxial strains and magnetic fields. One-particle wave functions were used in this calculation and an allowance was made for the symmetry of the electron and hole states dependent on the direction and sign of strain. In these approximations the fine structure was found to be governed by six interaction constants. On compression along the [001] axis the spectrum of the α_2 line consisted of three components, but four components were observed when tension was applied. A comparison of the calculations and experiments yielded the interaction constants, which were then used to calculate other spectra. The calculated spectra of the α_2 line in magnetic fields were in good agreement with the Zeeman α_2 spectra recorded on compression along the [001] axis. An investigation was made of the spectra of the α_2 line in the case when strains were applied along the [111] and [110] axes. A numerical calculation was made of these spectra and a qualitative agreement with the experiments was obtained. In the absence of strain, about ten components were resolved in the α_2 spectrum. Energy level schemes were proposed for the initial and final states and these accounted for the structure of the α_2 line. Details of the fine structure of the α_3 and α_4 lines could not be resolved, probably due to the large number and broadening of the components. (20 refs.)

119466 'Acceptor' and 'donor' excitons bound to transition-metal impurities in II-VI semiconductors. K.A.Kikoin, V.I.Sokolov, V.N.Flerov, V.V.Chernyaev (Inst. of Chem. Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1351-61 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2335-47 (Dec. 1982). [received: Oct. 1983]
The electroabsorption method is used to investigate narrow lines on the edge and in the interior of the photoabsorption band of nickel-doped ZnSe. These lines are interpreted as the first experimental proof of the amorphous character of exciton capture by a transition-metal impurity: the lines on the photoabsorption edge correspond to capture of an electron by a d-shell and of a hole by a hydrogenlike orbit ('acceptor' exciton), while capture of a line in the interior of the photoabsorption band corresponds to formation of a 'donor' exciton with a hole in the d-shell. A theory for amphoteric bound excitons is developed and the effect of giant enhancement of the oscillator strength following optical excitation of a donor exciton is explained. (25 refs.)

71.36 POLARITONS

(inc. photon-phonon and photon-magnon interactions)

119467 The role of polaritons in superconductivity phenomenon [metal-dielectric contacts]. D.Mirjanic (Technol. Faculty, Univ. of Banja Luka, Banja Luka, Yugoslavia), D.Hadziahmetovic.
Fizika (Yugoslavia), vol.15, no.3, p.225-31 (July-Sept. 1983).
Analysing the influence of electromagnetic waves on the magnitude of the superconductivity energy gap it was shown, that some increase can be reached if there is a sandwich between a semi-infinite metal and a semi-infinite dielectric with optical characteristics. It was predicted theoretically that the superconductive motion of electrons is possible at the temperatures of about 100-200K. This effect can be expected only for those electrons which are very close to dielectric part of the sandwich. (10 refs.)

119468 Effects of gaps on long range surface plasmon polaritons. G.I.Stegeman (Arizona Res. Labs., Univ. of Arizona, Tucson, AZ, USA), J.J.Burke.
J. Appl. Phys. (USA), vol.54, no.9, p.4841-3 (Sept. 1983).
The authors show that air gaps of 50 Å and less in a symmetric dielectric-metal film-dielectric structure lead to mode cutoff for long range surface plasmons. High index liquids are discussed as a solution to this problem for most cases. (7 refs.)

119469 The polariton soliton formation due to the effect of the dipole momentum saturation. G.D.Shibarshina, S.A.Moskalenko, P.I.Khadzhi (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.153-8 (1 Sept. 1983).
The energy flux density of the incident light upon the crystal surface and the form of the wave packet envelope with frequencies lying in the exciton range of the spectrum are determined. They must be of such a nature that after the penetration into the semi-infinite crystal the laser pulse can travel at once as a solitary wave without any transient stage. In the case considered the effect of dipole momentum saturation (DMS) for the transition from the ground state of the crystal to that of the exciton is the main nonlinearity. The Maxwell-Fresnel boundary conditions are used on the interface between the vacuum and the crystal. (10 refs.)

119470 Conditions for formation of polariton-like solitons and transmission of an ultrashort light pulse across a crystal-vacuum interface. S.A.Moskalenko, P.I.Khadzhi, G.D.Shibarshina, A.Kh.Rotaru, F.N.Georgitsa (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.387-9 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.678-83 (March 1983). [received: Oct. 1983]
For frequencies in the exciton region of the spectrum, the light energy flux density incident on a crystal from vacuum is determined, and also the shape of the wave packet envelope, necessary for propagation as a soliton wave packet without an intermediate transitional stage, immediately after entering a semiinfinite sample. The principal properties of the wave packets, such as the energy flux density in vacuum, the exciton and photon component amplitudes for a soliton in a crystal, the refractive index and the reflectivity at the interface of the two media, are expressed in closed form in terms of the detuning from resonance between the soliton carrier-wave frequency and the limiting frequency of the transverse exciton. (18 refs.)

119471 Polariton excitations in gyrotropic crystals. A.N.Goncharuk, N.S.Tyu, S.A.Fedorov.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1338-42 (Sept. 1983). In Russian.
The theory of polaritons in molecular crystals is analyzed with regard to the space dispersion. Simple and convenient formulas are obtained for calculating coefficients of the canonical conversion of the exciton-photon Hamiltonian function. (8 refs.)

The temperature dependence of coherent two-photon processes in naphthalene in the strong exciton-photon coupling regime ....See Entry 118206

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS

(for electron-phonon interactions in lattices, see also 63.20K)

119472 A theory for a self-trapped molecular magnetic polaron in ferromagnetic semiconductor. M.Takahashi, T.Kasuya (Dept. of Phys., Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3127-37 (Sept. 1983).
Properties and stability conditions for a self-trapped molecular magnetic polaron in ferromagnetic semiconductors, in which two electrons are trapped in a self-induced localized spin polarization through the strong d-f exchange interaction, are investigated theoretically and in particular for EuO and EuS numerically. It is shown that the molecular magnetic polaron can be more stable than two single magnetic polarons near the Curie temperature if the material has many valley band structures and large dielectric constant. The dependences of the free energy of the molecular polaron as well as the single polaron on the effective electron mass, the Curie temperature and d-f exchange interaction were studied. The possibility of the molecular polaron in EuO and EuS is discussed. Effect of the anisotropic effective mass was also studied by the molecular field theory and it was shown that it is not important. (17 refs.)

119473 Effect of electron-phonon interaction in the magnetic polaron. M.Takahashi, T.Kasuya (Dept. of Phys., Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3138-43 (Sept. 1983).
The effect of the electron-LO phonon interaction on the magnetic polaron in EuS and EuO is studied by the trial Hamiltonian method theoretically. It is shown that this effect stabilizes the magnetic polaron more by shrinking its radius. The stability regions of both the single and the molecular magnetic polarons become wider. However, the relative stability of the molecular polaron to the decomposed two single polarons does not change so much. (2 refs.)

119474 Polarons and solitons in trans-$(CH)_x$: an optical study. S.Etemad (Bell Labs., Whippany, NJ, USA), A.Feldblum, A.G.MacDiarmid, T.C.Chung, A.J.Heeger.
J. Phys. Colloq. (France), vol.44, no.C-3, p.413-22 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The absorption spectra of polaron and soliton excitations in trans-$(CH)_x$ have been characterized experimentally using the detailed quantitative studies of the near-ir-absorption during the electrochemical doping process. The quantitative agreement with the calculations of soliton mid-gap absorption is shown to be a direct evidence for the proposal that doping of trans-$(CH)_x$ predominantly proceeds through soliton formation. The intense δ-function transition between the two localized levels of a polaron is observed to give rise to a series of sharp ($\leq$0.1 eV wide) additional absorptions which the authors have used to monitor polaron concentration during the doping process. Consistent with the metastability of polarons in trans-$(CH)_x$, with a pair decaying into the lower energy soliton-antisoliton pair, polarons are found to be present only at very dilute doping levels. (21 refs.)

119475 Polarons in quasi-one-dimensional conducting polymers. A.R.Bishop, D.K.Campbell, K.Fesser (Theoretical Div., Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.423-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Discusses several aspects of polaron excitations in quasi-one-dimensional conducting polymers. The authors review the structure of polarons in trans- and cis-$(CH)_x$, illustrate the relation of polarons in SSH-type models to conventional one-band polarons, and establish the existence and properties of polarons in conjugated diatomic polymers of the $(\bar{A}=B)_x$ type. (19 refs.)

119476 Soliton diffusion in polyacetylene. K.Maki (Phys. Dept., Univ. of Southern California, Los Angeles, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.485-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Making use of the Su, Schrieffer and Heeger (SSH) model (1979) for polyacetylene, the author studies theoretically the soliton diffusion in pristine trans-$(CH)_x$. The soliton in the SSH model couples linearly both optical and acoustic phonons. Since the coupling to the optical phonon is stronger, the optical phonon dominates the soliton diffusion in high temperature ($T>400K$). However, below the room temperature the acoustic phonon dominates the soliton diffusion. For temperature $T>T_0\equiv 2mc^2$, where m is the soliton mass and c is the acoustic phonon velocity, the soliton relaxation is determined by the single phonon process. This process results in the diffusion constant $D\propto T^{1/2(2-d)}$, where d is the dimensionality of the acoustic phonon. For $T<T_0$ the acoustic phonon process becomes inefficient. The results are compared with existing experiments on the diffusion constant. (13 refs.)

119477 Polaron formation near a mobility edge. M.H.Cohen, E.N.Economou, C.M.Soukoulis (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1202-5 (26 Sept. 1983).
By combining the Emin-Holstein scaling theory of polaron formation with the scaling theory of localization in disordered systems, the authors show that the nonuniform extended eigenstates above edge (responsible for the continuous drop of the mobility to zero) collapse to localized polarons as the electron-phonon interaction is turned on. (21 refs.)

119478 The theory of magnetic polarons in antiferromagnetic semiconductors. B.V.Egorov, B.B.Timofeev (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.99-112 (1 Sept. 1983).
The electron states in antiferromagnetic semiconductors with large atomic spins S and an arbitrary relation between the band width ΔE and the spin-electron interaction A are considered. It is shown that in the mean-field approximation of atomic spins the spin-electron interaction in the case of $AS\geq\Delta E$ leads to essential transformations in the electron spectrum, while the interactions of electrons with the spin deviations from the average values (at $T=0$ with virtual magnons) leads to a polaron-type quasi-particle formation: the antiferromagnetic polaron (AFP). With the help of the diagram technique at $T=0$ the AFP Green function and its spectrum are obtained. (19 refs.)

71.45 COLLECTIVE EFFECTS

119479 Correlation functions of quasi-one-dimensional systems. A.A.Kovchinnikov, V.Ya.Krivnov (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1513-18 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The correlation functions of one-dimensional Fermi-gas are found. At zero temperature the correlators at large distances decrease according to a power law, the exponent being a simple function of the velocity of sound. (11 refs.)

119480 Solitons in charge and spin density wave systems. B.Horovitz (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1519-23 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A unified description of solitons in terms of two phases is presented and a counting rule for soliton charge and spin is derived. New types of solitons are found, in particular a spin density wave in an odd-order commensurate system must coexist with a charge density wave, and solitons then have an irrational spin component. (17 refs.)

119481 Electronic excitations in quasi one-dimensional dielectrics. S.Brazovskii, N.Kirova, V.Yakovenko (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., Moscow, USSR).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1525-30 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The theory of electronic excitations in quasi one-dimensional dielectrics of the Peierls type is discussed. The emphasis is made on the effects of potential (both strong and weak) and tunnel (weak) coupling and stability of electrons and solitons. (9 refs.)

119482 Charge ordering in 1-D molecular type crystals. D.Feinberg, J.Ranninger (Groupe des Transitions de Phases, CNRS, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1561-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
In a one-dimensional metal composed of stacked molecules, a strong coupling of the electrons to intramolecular deformations leads to an almost saturated CDW (charge density ordered state). The authors compare this instability to the classic Peierls instability. (4 refs.)

119483 The effect of impurities and electron-phonon interaction on the phase diagram of 1-D conductors. J.Solyom (Central Res. Inst. for Phys., Budapest, Hungary).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1565-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The phase boundaries of the 'g'-ology model are studied by using exact symmetry properties of the model. The effect of impurity scattering and retardation is also considered. (6 refs.)

119484 Dynamics of pinned charge density waves in $NbSe_3$. R.A.Klemm (Exxon Res. & Engng. Co., Linden, NJ, USA), J.R.Schrieffer, G.Gruner.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1689-92 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The model of Fukuyama and Lee for the pinning of charge density waves by impurities is investigated. The authors calculate the force-force correlation function, and find that the threshold electric field E_T is proportional to n_i^2. (3 refs.)

119485 Charge density wave domains in irradiated 1T-TaS_2: relation with the transport properties. H.Mutka (CEN, Fontenay-aux-Roses, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1713-15 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Electron microscopy observations show that lattice defects break the charge density wave into domains. The role of these domains in the electronic transport is discussed. (10 refs.)

119486 Stacking of charge-density waves in 1*T* transition-metal dichalcogenides. M.B.Walker, R.L.Withers (Dept. of Phys., Univ. of Toronto, Toronto, Canada).
Phys. Rev. B (USA), vol.28, no.5, p.2766-74 (1 Sept. 1983).
An extension of the McMillan (1975) and Nakanishi and Shiba (1977) models of charge-density-wave formation which fully reflects the space-group symmetry of the 1*T*-TaS_2 structure is presented. The model allows an incommensurate *c*-axis wave vector immediately below the normal to incommensurate transition temperature and a *c*-axis wave-vector lock-in transition at a lower temperature. The model also allows a number of different commensurate phases characterized by different charge-density-wave stacking configurations. A triple-honeycomb domain structure is described. (23 refs.)

119487 Influence of transverse motion quantization on the normal vibration spectrum of a two-dimensional Wigner lattice. V.M.Burdeinyi (Polytech. Inst., Vinnitsa, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.525-6 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.913015 (March 1983). [received: Oct. 1983]
The author computes the vibrational spectrum of a two dimensional electronic Wigner lattice with allowance for the quantum distribution of electron density in consequence of quantization of the motion perpendicular to the lattice. (7 refs.)

71.45G Exchange, correlation, dielectric and magnetic functions, plasmons

119488 Correlation and disorder effects on the soliton states in a model polymer. S.Stafstrom, K.A.Chao (Dept. of Phys. & Measurement Technol., Univ. of Linkoping, Linkoping, Sweden).
J. Phys. C (GB), vol.16, no.28, p.L985-9 (10 Oct. 1983).
Assuming a single Slater determinant for the many-particle eigenfunction, an exact numerical solution for a chain of 60 molecules containing soliton states has been derived to study the electron correlation and disorder effect when both regular and stereo-irregular dimerised chains are considered. A profound influence due to the electron interaction is clearly demonstrated. (11 refs.)

119489 Multiple branches of acoustic plasma oscillations in thin wires. Y.C.Lee, S.E.Ulloa (Dept. of Phys. & Astron., State Univ. of New York at Buffalo, Amherst, NY, USA), P.S.Lee.
J. Phys. C (GB), vol.16, no.28, p.L995-1003 (10 Oct. 1983).
Multiple nonLandau-damped acoustic plasma modes are shown to exist for electrons in a slender wire. These slender acoustic plasmons (SAP) arise as a result of the collective, longitudinal oscillations of the electrons grouped in one of the discrete transverse-motion levels against those grouped in neighbouring levels. The authors present numerical examples of these (SAP) modes in GaAs, showing that they should be observable with the present techniques of thin semiconductor wire fabrication. In addition, another mode arising from the screened ion oscillations as modified by the slenderness of the wire is analysed. (14 refs.)

119490 Dielectric properties of polyacetylene. J.W.Mintmire, C.T.White, D.L.Peebles (Naval Res. Lab., Washington, DC, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.507-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors present a theoretical first-principles anisotropic dielectric function for all-trans polyacetylene. This dielectric function is shown to describe the 8-9 eV dielectric response peak measured using electron energy-loss spectroscopy. (7 refs.)

119491 Virtual surface plasmons in cylinders. S.S.Martinos (Dept. of Phys., Nuclear Res. Center Demokritos, Aghia Paraskevi, Athens, Greece), E.N.Economou.
Phys. Rev. B (USA), vol.28, no.6, p.3173-81 (15 Sept. 1983).
In a metallic cylinder virtual radiative surface eigenmodes with frequencies greater than plasma frequency exist; their dispersion curves and other properties are determined. The physical importance of these eigenmodes in the optical properties of metallic cylinders is shown. (13 refs.)

119492 Valence and core excitation spectra in K, Rb, and Cs alkali-metal stage-1 intercalated graphite. L.A.Grunes, J.J.Ritsko (Xerox Webster Res. Center, Webster, NY, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3439-46 (15 Sept. 1983).
Excitation spectra of the alkali-metal stage-1 intercalated graphites KC_8, RbC_8 and CsC_8 have been measured by high-resolution (0.1 eV) electron-energy-loss spectroscopy. The π intraband and interband plasmon excitations in the region below 10 eV are the same in all three compounds. However, in the valence region between 15 and 30 eV, small peaks are observed in RbC_8 and CsC_8 which are weaker than those previously observed in KC_8. In KC_8, these structures were identified as both excitations to the backfolded graphite bands created by the introduction of the intercalant and also as characteristic metal-atom core excitations. Within this interpretation, the weakening of the structure due to the backfolded bands with intercalant atomic number is consistent with weakening the coupling far above the Fermi level between the graphite and intercalant atoms. The carbon 1*s* core shell excitation at ~285 eV is also reported. The authors find that both the spectral shape and threshold energy are unaffected by the choice of alkali-metal intercalant (K, Rb, Cs), although the resulting spectrum differs from that of pristine graphite. Hence the graphite *p* states just above the Fermi level which are probed by the C 1s excitation are identically perturbed by the K, Rb, and Cs intercalations, suggesting that the degree of hybridization and charge transfer in these materials is the same. (19 refs.)

119493 Interchain Coulomb interactions in polyacetylene. S.Jeyadev (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3447-56 (15 Sept. 1983).
The difference in the π electron-electron interaction energy between charge-density waves in and out of phase on two parallel trans-polyacetylene chains is calculated up to second order in perturbation theory. It is found that this interaction favors the in-phase configuration, leading to a confinement potential when a soliton-antisoliton pair is present on the same chain. The confinement potential is found to go as $e^{-\pi d/a}/d^3\sqrt{\pi d/a}$, where d is the interchain separation and a the undimerized lattice spacing. The confinement potential is calculated to be 0.15K/site for a pair of chains. (14 refs.)

71.45N Calculations of total electronic binding energy

(see also 61.50L Crystal binding)

119494 Structural properties of III-V zinc-blende semiconductors under pressure. S.Froyen, M.L.Cohen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3258-65 (15 Sept. 1983).
The pseudopotential method within the local-density approximation is used to investigate the static and structural properties of some III-V compound semiconductors. Comparisons of calculated total energies as a function of volume and structure yield information about solid-solid phase transformations. At high pressures the results indicate that several metallic structures are lower in energy than the zinc-blende structure. From the results the compounds (AlP, AlAs, GaP, and GaAs) can be devided into two classes. In the Ga compounds, the authors find a pressure-induced phase transformation to either rocksalt, β-Sn, or NiAs, whereas in the Al compounds rocksalt and NiAs are stabilized with respect to β-Sn. All structures except zinc blende are metallic. The authors discuss the electronic structure of each phase and show how it relates to structural stability. (30 refs.)

119495 Total energy of Al within the neutral-pseudoatom model. G.S.Sohoni, D.G.Kanhere (Dept. of Phys., Univ. of Poona, Poona, India).
Phys. Rev. B (USA), vol.28, no.6, p.3582-4 (15 Sept. 1983).
A simple scheme using a single-ion approach has been developed to calculate the total energy of simple metals within the neutral-pseudoatom model. The method has been applied to Al and the results of total energy and cohesive energy are reported. The individual components of the total energy are compared with the self-consistent calculation of Lam and Cohen (1981). The results indicate that the electron charge density in a simple metal such as Al is fairly well reproduced by the neutral-pseudoatom model. (11 refs.)

119496 Self-interaction correction for the Wannier representation of the uniform electron gas. M.R.Norman (Dept. of Phys., Tulane Univ., New Orleans, LA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3585-6 (15 Sept. 1983).
The self-interaction correction (SIC) to the local-density approximation is evaluated for the total energy in the Wannier representation of plane waves and is found to be a small, but positive, number. This indicates that the delocalized plane waves are the correct solution of the SIC equations for a uniform electron gas, and thus this calculation provides a good consistency check on the SIC method. (5 refs.)

Local-density—functional approach to all-trans-polyacetylene .... See Entry 119396

71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(exc. impurities; for localisation in disordered structures, see 71.55J)

119497 On the self-consistency of the one-parameter scaling theory of localisation. S.K.Sarker (Lab. of Atomic & Solid State Phys., Cornell Univ. Ithaca, NY, USA).
J. Phys. C (GB), vol.16, no.28, p.L991-4 (10 Oct. 1983).
The assumptions underlying the one-parameter scaling theory of localisation and their implications are examined in detail. In contrast to the conclusions reached by Kumar (see ibid., vol.16, p.L109, 1983), the theory is found to be self-consistent. (8 refs.)

119498 Onset of rare earth behavior in the actinides. J.L.Smith (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.357 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given, as follows. In the rare earth elements almost the entire crossover from transition metal to localized f electron behavior occurs at cerium. In the actinides this behavior is spread out over uranium, neptunium and plutonium because of the more spatially extended 5f electrons. If applied pressure is included, there is completely equivalent behavior between the rare earths and the actinides with only a shift to heavier elements in the actinides. There are then parallels in such properties as superconductivity, magnetism and mixed valence. There are also tantalizing differences. For example some of the mixed valence behavior in samarium materials should occur in americium materials. Then the presence of one more f electron should simplify measurements of the mixed valent properties. The systematics of the actinides is compared with that of the rare earths. (2 refs.)

119499 Discrete intragap Pb states in $Pb_{1-x}Sr_xS$. M.A.Tamor, L.C.Davis, H.Holloway (Ford Motor Co., Dearborn, MI, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3320-3 (15 Sept. 1983).
The authors observe intragap Pb states in the alloy semiconductor $Pb_{1-x}Sr_xS$. Absorption spectroscopy shows that $Pb_{1-x}Sr_xS$ has an energy gap which decreases from 4.6 eV at $x=1$ to 0.4 eV at $x=0$. At very small Pb concentration ($x=0.993$) is a discrete absorption peak appears at 3.5 eV. As the Pb content is increased, this absorption grows in strength and a second peak appears at 3.2 eV. These peaks are ascribed to isolated Pb atoms and Pb dimers, respectively. When the samples are cooled to 80K the linewidths decrease by 40%. This improved definition reveals a third, very small absorp-

tion peak at 3.1 eV, possibly due to a Pb trimer. These results may be interpreted in terms of a simple tight-binding model that predicts an *s*-like impurity state above the valence band. This state is localized on the S atoms surrounding the Pb atom. Also, a *p*-like state due to the Pb 6*p* orbitals exists below the conduction band. Transitions from the *s* to the *p* state account for the impurity spectra. (12 refs.)

119500 Electron localization near a band edge and dielectric constant of TCNQ salts with strong structural disorder. A.A.Gogolin (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1309-15 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2260-72 (Dec. 1982). [received: Oct. 1983]
Electron localization near a band edge in one-dimensional disordered systems is investigated at arbitrary values of the parameter $p_F l \sim 1$. The Berezinskii diagram technique is used. It is shown that near $p_F l$ the localization length l_{loc} and the static dielectric constant ϵ' decrease by one or two orders in a narrow interval of the parameter $p_F l$. this abrupt transition explains the temperature dependence of ϵ' in TCNQ salts with asymmetric cations. (17 refs.)

71.55 IMPURITY AND DEFECT LEVELS

119501 Application of generalized effective mass theory to some native point defects in $Hg_{1-x}Cd_xTe$. C.L.Wang, S.Wu, D.S.Pan (Electrical Engng. Dept., Univ. of California, Los Angeles, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1631-2 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The authors have studied a few native defects in $Hg_{1-x}Cd_xTe$ in the effective mass approximation. For the case of mercury vacancy, which is of particular interest, this approach is quantitatively meaningful. The calculated levels for the neutrals and charged vacancies are reported. (8 refs.)

119502 Electronic properties of deep levels in *p*-type CdTe. R.T.Collins, T.C.McGill (California Inst. of Technol., Pasadena, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1633-6 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
DLTS and associated electrical measurements were made on unintentionally doped CdTe crystals obtained from several vendors, on Cu-doped CdTe, and on Te-annealed CdTe. All of the crystals were *p*-type. Four majority carrier deep levels were observed in the temperature range from 100-300K with activation energies relative to the valence band of 0.2, 0.41, 0.45, and 0.65 eV. Two of these levels were specific to certain crystals while the other two were seen in every sample and are attributed to common impurities or native defects. Fluctuations in the concentrations of levels across samples and as a result of modest sample heating (400K) were also observed. (12 refs.)

119503 Deep centers in gold-doped HgCdTe. C.A.Merilainen, C.E.Jones (Santa Barbara Res. Center, Goleta, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1637-40 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Gold is a fast-diffusing acceptor in HgCdTe. It has been used as a *p*-type dopant and as a metal contact. This paper reports the presence of deep levels in gold-doped $x=0.48$ $Hg_{1-x}Cd_xTe$. Two types of spectra were observed; each had energy levels between $E_v+1/4E_{gap}$ and $E_v+1/2E_{gap}$. The capture cross sections for these centers have been determined and for most of the levels they involve small hole capture cross sections, 10^{-17} to 10^{-21} cm^2, and moderate electron capture cross sections, 10^{-15} to 10^{-16} cm^2. The hole capture cross sections for these centers had large negative activation energies indicative of hole capture at a positive center with a Coulomb repulsive barrier. The corresponding electron capture is then at Coulombically attractive positive centers. The situation described requires that the DLTS activation energies be corrected for the temperature dependence of the hole capture cross sections and for the Poole-Frenkel effect for electron capture. The energy levels and capture cross sections reported make these centers effective minority carrier recombination sites in *p*-type material. The minority carrier lifetimes measured are very close to those calculated for Shockley-Read recombination at the DLTS characterized centers. (7 refs.)

119504 Deep level Fourier spectroscopy: a new method to analyze deep levels in semiconductors. K.Ikeda, H.Takaoka.
Electr. Commun. Lab. Tech. J. (Japan), vol.32, no.6, p.1383-97 (1983). In Japanese.
A new technique has been developed for analyzing deep levels in semiconductors. In this technique, called Deep Level Fourier Spectroscopy (DLFS), the deep level emission rate is sequentially determined from various numerical calculations, by means of Fourier transforms for the transient capacitance values. This method makes it possible to analyze deep levels without having to determine spectral peaks. Computer simulation and experiments with p-type Si Schottky diodes are demonstrated. A comparison with the DLTS method proves that DLFS is an efficient and convenient method for evaluating deep levels. (14 refs.)

119505 Deep level transient spectroscopy evaluation of nonexponential transients in semiconductor alloys. P.Omling, L.Samuelson, H.G.Grimmeiss (Dept. of Solid State Phys., Univ. of Lund, Lund, Sweden).
J. Appl. Phys. (USA), vol.54, no.9, p.5117-22 (Sept. 1983).
Evaluation of data obtained from deep level transient spectroscopy (DLTS) is often based on the assumption that the transients are exponential. The applicability of DLTS to the study of deep energy levels in semiconductor alloys has therefore been questioned since thermal transients are often nonexponential in these materials. The authors present calculated DLTS spectra in a simple model for broadened defect levels. The calculated spectra are compared with experimental data for a deep electron trap in $GaAs_{1-x}P_x$. The main result is that, within the model, DLTS-deduced activation energies and thermal emission rates are, indeed, relevant even when the transients are strongly nonexponential as a result of alloy broadening. A method of estimating the corrected concentration of deep levels and the distribution in binding energies is also presented. (12 refs.)

119506 Application of the orthogonality theorem to the motion of a charged particle in metals. K.Yamada (Res. Inst. of Fundamental Phys., Kyoto Univ., Kyoto, Japan), A.Sakurai, M.Takeshige.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.73-84 (July 1983).
An overlap integral between many-electron wave functions perturbed with local potentials at different sites is obtained in a closed form as a function of the phase shift and the distance between two impurities. The authors use the result to determine the reduction of the transfer motion of a charged particle in metals when screened by conduction electrons. The condition for the localization of the charged particle is derived. As an example, the two-*d*-hole bound state in resonant photoemission from transition metals is discussed. (6 refs.)

119507 Defect symmetry from stress transient spectroscopy. J.M.Meese, J.W.Farmer, C.D.Lamp (Res. Reactor Facility, Univ. of Missouri, Columbia, MO, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1286-9 (3 Oct. 1983).
Uniaxial stress has been used with transient spectroscopy to study the level at E_c-0.17 eV in neutron-irradiated silicon. The defect symmetry, observed stress-induced electronic redistribution, and preferential stress-induced defect orientation have been determined and the reorientation activation energy has been measured. All of these effects are consistent with the A center. (10 refs.)

119508 Characterization of deep energy levels in mercuric iodide. T.Mohammed-Brahim (Lab. Cristaux et Couches Minces CEN, Alger, Algeria), A.Friant, J.Mellet.
Phys. Status Solidi a (Germany), vol.79, no.1, p.71-82 (Sept. 1983).
The past few years have seen an increasing interest in HgI_2 detectors for room temperature γ- and X-ray spectrometry. The performance and effective thickness of these detectors are presently limited by carrier trapping which results in incomplete charge collection. Characterization of the trapping levels is performed by several photoelectronic methods (photoconductivity, thermal and optical quenching of the photoconductivity, TSC, lifetime measurement). A model is proposed taking into account the results obtained by these techniques in both vapor phase and solution grown crystals. (39 refs.)

119509 Evidence for correlation effects in the hyperfine structure of the negative vacancy in silicon. M.Lannoo (Lab. de Phys. des Solides, Inst. Superieur d'Electronique du Nord, Lille, France).
Phys. Rev. B (USA), vol.28, no.5, p.2403-10 (1 Sept. 1983).
Recently published experimental data on the hyperfine structure of the negative vacancy in silicon are discussed. They contradict the prediction of one-electron theories that the contact terms of atoms lying in certain symmetry planes should vanish. A first possible explanation consisting of an inverted order of the one-electron levels is shown to require a much-too-large distortion coupling. The influence of many-electron effects is then worked out in some detail and shown to provide a correct order of magnitude for these contact terms when using parameters determined previously for V^0. This demonstrates (i) that a coherent picture of many-electron effects is obtained for the different charge states of the vacancy; (ii) that many-electron effects have little influence on the ground state, confirming Watkins's view that the Jahn-Teller effect dominates this state; and (iii) that the many-electron effects are indeed at the origin of these small nonvanishing contact terms. (12 refs.)

119510 Annealing of electron-induced defects in *n*-type germanium. P.M.Mooney, F.Poulin, J.C.Bourgoin (Groupe de Phys. des Solids, Ecole Normale Superieure, Univ. de Paris VII, Paris, France).
Phys. Rev. B (USA), vol.28, no.6, p.3372-7 (15 Sept. 1983).
n-type, 10^{13} and 2×10^{15} cm^{-3} doped germanium has been irradiated with $\sim$1-MeV electrons at liquid-helium and room temperatures. With the use of transient-capacitance spectroscopy, six electron traps and one hole trap were observed following irradiation at 4K. Their energy levels have been determined to be E_c-40, 120, 120, 260, 390, and 530 meV, and at E_v+250 meV. The isochronal annealing behavior of these traps, in addition to that of the four electron traps and of the four hole traps produced by room-temperature irradiation, has been studied in detail. Comparison of the results with previously published ones indicates that (i) the divacancy anneals around 150°C, and the *E* center around 100°C, (ii) the two levels at E_c-120 meV are associated with the germanium interstitial or complexes involving a germanium interstitial, and (iii) there appears to be a vacancy level in the range 100-200 meV from the conduction band, which anneals at $\sim$100K. (19 refs.)

119511 Effect of electron-mass anisotropy and effective dielectric function on the donor binding energies in silicon. A.Neethiulagarajan (Dept. of Phys., Virudhunagar Hindu Nadars' Senthikumara Nadar Coll., Virudhunagar, India), S.Balasubramanian.
Phys. Rev. B (USA), vol.28, no.6, p.3601-3 (15 Sept. 1983).
With the use of the Krieger-Nightingale model, the donor binding energy in Si is calculated variationally as a function of donor concentration. The impurity potential incorporates an effective dielectric function of the host and impurity electrons. The mass anisotropy of the electron is also included. The Mott constant, $aN_c^{1/3}$, obtained is compared with the earlier results. (10 refs.)

119512 Value of the signal of the double correlation DLTS method. A.Le Bloa (Groupe d'Electronique et de Phys. des Materiaux, Univ. de Rennes I, Rennes, France).
Rev. Phys. Appl. (France), vol.18, no.9, p.561-4 (Sept. 1983). In French.
The real signal of double correlation DLTS method is calculated; it is shown that it is necessary to use this signal to determine the characteristics of the defects. (6 refs.)

71.55J Localization in disordered structures

119513 Theoretical studies of the physics of charged defect formation in doped organic polymers: towards a coherent theoretical picture. J.L.Bredas (Lab. de Chimie Theorique Appliquee, Facultes Univ. Notre-Dame de la Paix, Namur, Belgium), B.Themans, J.M.Andre, R.R.Chance, D.S.Boudreaux, R.Silbey.
J. Phys. Colloq. (France), vol.44, no.C-3, p.373-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
From Hartree-Fock self-consistent-field calculations on trans-polyacetylene, polyparaphenylene, and polypyrrole, a coherent theoretical description emerges for the physics of conducting doped organic polymers. The importance of the geometric modifications that occur on the polymer chains upon charge transfer is stressed. These modifications are shown to lead to the appearance of electronic states in the gap that play a major role in the conductivity mechanism. MNDO calculations on trans-polyacetylene chains indicate that the geometries of soliton or polaron defects vary significantly with their charge state. (22 refs.)

119514 Impurity-induced defect states in polyacetylene. D.Baeriswyl (Seminar fur Theoretische Phys., ETH-Honggerberg, Zurich, Switzerland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.381-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The effect of impurities on both the electronic structure and the lattice distortions in polyacetylene is studied using the SSH Hamiltonian and an impurity potential acting on a single site. Assuming an ideally dimerized chain it is shown that the impurities lead to localized electronic states with energy levels tending to mid-gap and extents the impurity potential. Both the discrete and the continuum model yield the same result in the weak-coupling limit. The impurity-induced optical absorption is calculated and found to be weaker by a factor of about 4 than the soliton-induced absorption. Finally the modifications in the electronic structure are shown to lead to strong lattice relaxation, and it is concluded that the impurities affect both the electronic states and the displacement pattern of the lattice. (13 refs.)

119515 Effect of an isolated impurity on the electronic structure of $(CH)_x$. J.P.Albert, C.Jouanin (Groupe d'Etudes des Semiconducteurs, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.387-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The influence of the presence of an impurity lying near a $(CH)_x$ chain is studied on the polaron and soliton gap levels. (4 refs.)

119516 Singular spectra in one-dimensional random systems. T.A.L.Ziman (Inst. Laue-Langevin, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1555-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The author discusses the occurrence of singular densities of states in random one-dimensional Hamiltonians at exceptional energies for which eigenstates are localised more weakly than exponentially. Simple examples are given. (6 refs.)

119517 Localization and interactions in a disordered electron gas. M.Ma (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), E.Fradkin.
Phys. Rev. B (USA), vol.28, no.6, p.2990-3006 (15 Sept. 1983).
The authors consider a model of N species of electrons in a random potential interacting via a short-range repulsive interaction. They study the $N=\infty$ limit and the $1/N$ expansion to the leading order in $1/N$. After renormalizing the theory, they find that there are three coupling constants in this problem: (i) a coupling constant with the dimensions of the resistivity, (ii) the coupling for electron-electron scattering, and (iii) the coupling strength between diffusive modes and density fluctuations. The renormalization-group equations are presented. In $2+\epsilon$ dimensions the Anderson fixed point of the noninteracting theory is shown to belong to a line of unstable fixed points. A new ('interacting') fixed point is found. At the transition they find that, to leading order in $1/N$, (a) the exponent ν of the localization length is the same as in the noninteracting theory, (b) the DC conductivity vanishes at the mobility edge with an exponent $s={}^2/_{17}$, (c) the density of states at the Fermi surface vanishes at the mobility edge with an exponent $\delta={}^2/_{17}$, (d) the mean free time τ at the Fermi surface vanishes at the mobility edge with an exponent $\zeta={}^7/_{17}$, (e) the Fermi velocity diverges at the mobility edge with an exponent $\rho={}^5/_{17}$, and (f) the diffusive modes acquire wave-function renormalization and the anomalous dimension η is (to leading order) equal to $\epsilon/34$. (30 refs.)

119518 Localized states and the electronic properties of a hydrogenated defect in amorphous silicon. D.P.DiVincenzo (Dept. of Electrical Engng., Univ. of Pennsylvania, Philadelphia, PA, USA), J.Bernholc, M.H.Brodsky.
Phys. Rev. B (USA), vol.28, no.6, p.3246-57 (15 Sept. 1983).
The authors study the electronic properties of a hydrogen-dressed silicon monovacancy as a model of H centers in hydrogenated amorphous silicon (*a*-Si:H). Using the self-consistent Green's-function technique they obtain total and local densities of states for the defect, as well as the charge density of defect eigenstates. The hydrogenated vacancy has no states in the band gap and reduces the Si host density of states at both the valence- and conduction-band edge. The Si-H bonding character of the defect eigenstates is greatest 4.5 eV below the valence-band edge; however, no sharp H-induced resonance occurs anywhere in the valence or conduction bands. The authors discuss the importance of including the self-consistent rearrangement of charge around the H atom in obtaining accurate results for the hydrogenated vacancy. Within the context of a recently proposed quantum-well model, they relate the results of their Green's-function calculation to the properties of *a*-Si:H. Using several simple models (percolation theory, the Anderson model, effective-mass theory), they obtain estimates for the valence- and conduction-band mobility edges. They find that the valence band is much more strongly affected than the conduction band by H disorder, and that H disorder is more important than dihedral-angle disorder in valence-band edge localization. 71.70 LEVEL SPLITTING AND INTERACTIONS

(see also 75.10 – in magnetic phenomena, 75.30E Exchange and superexchange interactions, 73.20 Electronic surface states)

119519 Calculation of the charge transfer in ion-radical salts. L.Komorowski (Inst. of Organic & Phys. Chem., Tech. Univ. of Wroclaw, Wroclaw, Poland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1211-13 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A phenomenological method of calculation of the charge transfer in crystals has been derived from the density functional theory. Ionic charges in a broad selection of inorganic crystals and organic ion-radical salts have been reproduced. (9 refs.)

119520 Possibility of a distortion induced gap in intermediate valence compounds. B.R.Alascio, A.A.Aligia, C.A.Balseiro (Centro Atomico Bariloche, CNEA, Bariloche, Argentina).
Solid State Commun. (USA), vol.48, no.2, p.185-8 (Oct. 1983).
It is shown that in some stoichiometric intermediate valence compounds a symmetry breaking distortion leading to a hybridization gap in the electronic density of states can exist. The authors study this possibility for the high pressure phase of SmS and the paramagnetic phase of TmSe. (13 refs.)

119521 Mixed valence in $CeNi_5$; Effects of dilution and chemical pressure. S.Raaen, R.D.Parks (Dept. of Phys., Polytech. Inst. of New York, New York, NY, USA).
Solid State Commun. (USA), vol.48, no.2, p.199-202 (Oct. 1983).
X-ray L_{III} absorption measurements were employed to determine the (mixed) valence of the system $R_{0.9}Ce_{0.1}Ni_5$, where R=La, Pr, Gd, Er or Lu. The valences obtained spanned only the narrow range 3.13-3.16 in going from La to Lu, compared to 3.15 for the stoichiometric compound $CeNi_5$. These results establish the extreme insensitivity of the mixed valence of $CeNi_5$ to dilution effects, and, hence, that it is a local site phenomenon. Moreover, the valence is relatively insensitive to chemical pressure-induced lattice constant changes as large as 3 or 4%. (19 refs.)

119522 Destruction of the gap in the intermediate valence compound SmB_6 by neutron irradiation. J.Morillo, C.-H.de Novion (Section d'Etude des Solides Irradies, CEN, Fontenay-aux-Roses, France), J.Jun.
Solid State Commun. (USA), vol.48, no.4, p.315-19 (Oct. 1983).
The electrical resistivity ρ of a SmB_6 single crystal has been measured during and after a fast neutron irradiation performed at 21K: for the first time, it is shown that a very low defect concentration destroys the low temperature divergence of ρ in this compound. These results are considered as an evidence of the existence of an intrinsic gap in pure SmB_6, and of its destruction by point defects. On the contrary, the irradiation has increased the resistivity value at 300K, confirming the metallic character of SmB_6 at this temperature. The recovery of defects at 300K is very weak. (27 refs.)

119523 Exchange interaction and electron transport in mixed-valence clusters. M.I.Belinskii, B.S.Tsukerblat, N.V.Gerbeleu (Inst. of Chem., Acad. of Sci., Kishinev, Moldavian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.497-8 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.869-71 (March 1983). [received: Oct. 1983]
The authors consider two transition metal ions (a and b) in octahedral positions with electron configurations d^1 and d^2 (Ti^{3+}-Ti^{2+}) having a common axis $C_4(z)$. The ground-state levels of the d^1 and d^2 ions in the crystal field are ${}^2T_2(t^2)$ and ${}^3T_1(t_2{}^2)$. The results represent a generalization of the Anderson-Hasegawa theory since they include a realistic structure of the crystal field levels, the effect of the degeneracy of multiplets, and also the effect of the interatomic exchange interaction in the theory of electron migration. (6 refs.)

119524 Many body theory of intermediate valence systems. S.M.Price. Univ. Nottingham, England thesis, 1983
The author considers the zero temperature magnetic susceptibility of an intermediate valence system calculated for two approximate methods. The band structure is discussed with special reference to Luttinger's Theorem. A many body perturbation theory is then used to investigate the properties of the ground state of such a system, and the problems involved in letting the number of particles interacting become large ($N \to \infty$) are considered.

71.70C Crystal and ligand fields

119525 Interpretation of the optical and magnetic behaviours of $Pr_2Mg_3(NO_3)_{12}.24H_2O$. A.Nath (Magnetism Dept., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3244-7 (Sept. 1983).
The crystal field energy levels, the magnetic susceptibilities and the *g*-values of $Pr_2Mg_3(NO_3)_{12}.24H_2O$ were calculated theoretically by means of diagonalisation of the matrix of spin-orbit (SO), electrostatic (ES) and the crystal field (CF) interaction considered together, the matrix being constructed in a basis of all states of Pr^{3+} in the $4f^2$ configuration. A C_{3v} site has been assumed. The crystal field levels that were obtained from the aforesaid diagonalisation were used to calculate the *g*-values and principal magnetic susceptibilities. The set of parameters give a good fit to the three experiments (optical, EPR and susceptibility), and have been evaluated. (11 refs.)

119526 $(ReO_4)^{2-}$ ion in KCl: experimental evidence for a multimode intramolecular Jahn-Teller effect. H.Bill, Y.R.Sekhar (Groupe de Phys.-Chimie du Solide, Univ. de Geneve, Geneva, Switzerland).
Phys. Rev. B (USA), vol.28, no.5, p.2352-5 (1 Sept. 1983).
For the first time, experimental results have been obtained on a transition-metal tetroxy anion stabilised without any associated defects in a cubic crystal: the $(ReO_4)^{2-}$ ion in KCl. The authors' EPR study, including experiments under uniaxial stress and static electric fields applied to the crystal, shows that a strong and essentially intramolecular Jahn-Teller effect occurs but not exclusively of the $E \otimes \epsilon$ type. Appropriate linear combinations of the T_2 vibrations involving a pseudo-Jahn-Teller effect and spin-orbit coupling must play an important part. (16 refs.)

119527 Metal-ligand exchange effects and crystal field screening for rare-earth ions. L.I.Levin, V.I.Cherepanov (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.394-9 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.692-9 (March 1983). [received: Oct. 1983]
The importance of various contributions to the screening of the second-rank crystal field for rare-earth ions as regards the interpretation of the experimental results is examined. An expression more accurate than previous ones is derived for exchange in the screening, and a number of these not discussed hitherto are disclosed. (35 refs.)

119528 Superposition-exchange model of the second-rank crystal field for rare-earth ions. L.I.Levin, V.I.Cherepanov (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.399-403 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.700-7 (March 1983). [received: Oct. 1983]
A simple analytical expression is derived for several important contributions to the crystal field screening for rare-earth ions, arising from the allowance for metal-ligand exchange. The 'internal' parameters of the superposition model of the second-rank crystal field are calculated for the ion pair Tm^{2+}-F^- (ligand) in fluorites. (20 refs.)

71.70E Spin-orbit coupling, Zeeman, Stark and strain splitting

119529 A theoretical analysis of electron Zeeman and hyperfine tensors for polyacetylene. M.T.Jones (Dept. of Chem., Univ. of Missouri, St. Louis, MO, USA), H.Thomann, H.Kim, L.R.Dalton, B.H.Robinson, Y.Tomkiewicz.
J. Phys. Colloq. (France), vol.44, no.C-3, p.455-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The components of the electron Zeeman tensors have been determined for randomly and partially oriented samples of polyacetylene and composites of polyacetylene by millimeter wave EPR spectroscopy. The complete ^{13}C and ^1H hyperfine tensors have been measured by ENDOR and TRIPLE resonance spectroscopy. While the experimental results are in qualitative agreement with the predictions of soliton theories in that a delocalized π-electron wave function is observed, the experimentally observed spin density variations along the polyene backbone are in qualitative and quantitative disagreement with the currently existing soliton theories. In contrast, EWMO and McLachlan molecular orbital calculations, based on the assumption that the paramagnetic entity being observed is an odd, linear, neutral, polyene radical, reproduce the experimental observations very well. 71.70G Exchange interactions

119530 Application of a theory of special points to the calculation of a nonlocal exchange potential. I.I.Tupitsyn, R.A.Evarestov, V.A.Lovchikov (A.A. Zhdanov State Univ., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.355-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.625-9 (March 1983). [received: Oct. 1983]
The calculation of a nonlocal Hartree-Fock exchange potential in a crystal requires knowledge of the displaced (off-diagonal) first-order density matrix whose evaluation reduces to integration over the Brillouin zone. Direct application of quadrature formulas based on the theory of special points in the Brillouin zone can lead to a divergence in the exchange term of the Hartree-Fock operator. A theory of special points is generalized to rapidly oscillating functions of a wave vector and such generalization removes the aforementioned divergence. The present method is based on a weighting function which is introduced in the quadrature formula and this arbitrary weighting function is chosen to minimize the error in numerical integration over the Brillouin zone. 119531 **^{87}Rb electric field gradient tensors and the symmetry of the incommensurate phase in Rb_2ZnBr_4 and Rb_2ZnCl_4.** B.W.van Beest, A.Janner (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands), R.Blinc.
J. Phys. C (GB), vol.16, no.28, p.5409-16 (10 Oct. 1983).
The form of the Rb electric field gradient tensors observed in the incommensurate phases of Rb_2ZnBr_4 and Rb_2ZnCl_4 suggests that the superspace symmetry group of the incommensurate phase in these systems is $P_{ss\bar{1}}^{Pcmn}$. The incommensurate phase thus represents a modulation of the structure of the high-temperature phase and not a modulation of the structure of the low-temperature commensurate ferroelectric phase. The angular dependence of the $^{87}Rb\ {}^1/_2 \rightarrow -{}^1/_2$ NMR lineshape also suggests the above conclusion. (16 refs.)

119532 **Electric field gradients of Lu and Hf in Re.** E.Hagn, M.Zahn, E.Zech (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany).
Phys. Rev. B (USA), vol.28, no.6, p.3130-7 (15 Sept. 1983).
The nuclear orientation technique has been applied to dilute ^{173}Lu ($j^\pi=7/2^+$; $T_{1/2}=1.37$ yr) and ^{175}Hf ($j^\pi=5/2^-$; $T_{1/2}=70$ d) nuclei in a hexagonal Re crystal, the activities being produced in situ via the nuclear compound reaction $^{185,187}Re(\alpha, xn\ \gamma p)$ at $E_\alpha=172.5$ MeV. From the γ-ray anisotropies at temperatures down to 8 mK the quadrupole interaction frequencies $\nu_Q=e^2qQ/h$ of $^{173}LuRe$ and $^{175}HfRe$ have been determined as $-1149(100)$ MHz and $-540(43)$ MHz, respectively. The electric field gradients (EFGs) are deduced to be $eq(LuRe)=-13.2(1.2)\times10^{17}$ V/cm^2 and $eq(HfRe)=-8.3(8)\times10^{17}$ V/cm^2. The negative sign in both cases indicates that the direction of the EFG at the impurity sites is uniquely fixed by the properties of the host lattice. The absolute magnitudes of these EFGs differ strongly from that of the pure system Re*Re*; they cannot be explained satisfactorily with any correlation known at present. (53 refs.)

72.00 ELECTRONIC TRANSPORT IN CONDENSED MATTER

(for surfaces, interfaces, and thin films, see 73.)

72.10 THEORY OF ELECTRONIC TRANSPORT; SCATTERING MECHANISMS

119533 **Disordered-resistor network approach to the effective conductivity in inhomogeneous continua with substitutional disorder.** T.Nagatani (Coll. of Engng., Shizuoka Univ., Hamamatsu, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.5132-8 (Sept. 1983).
A disordered-resistor network model is presented to analyze the effective (or macroscopic) conductivity in the inhomogeneous continuum with a cellular-substitutional disorder, where the local conductivity g (**x**) varies randomly from cell to cell. The perturbation expansion for the lattice model is given to derive the effective conductivity from the statistical information about the random field g (**x**). The two-cell approximation taking into account pair configurations can be obtained from the partial sum of two-vertex terms by means of a diagrammatic representation of the perturbation series. The expression for the effective conductivity is presented up to the second-order term of the volume concentration c. This is also rederived from the different method, by solving problems involving two cells and averaging over all possible pair configurations. The coefficient of c^2 is numerically calculated for two models with the different pair configurations. The difference between pair configurations are clearly demonstrated by the present theoretical approach. It is shown that the calculated values agree with the experimental data of isotropic conducting paper into which square holes are punched at random. (57 refs.)

119534 **Hopping conduction in the *d*-dimensional lattice bond-percolation problem.** T.Odagaki, M.Lax, A.Puri (Dept. of Phys., City Univ. of New York, New York, NY, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2755-65 (1 Sept. 1983).
Hopping conduction of a bond-percolation model in *d*-dimensional lattices is studied by making use of the coherent-medium approximation. The DC conductivity vanishes when $p<p_c$ ($\equiv 2/z$) and is proportional to $p-p_c$ when $p\leq p_c$, where p is the probability that a given bond is not broken and z is the coordination number of the lattice. In the low frequency region, the leading term of the imaginary and real parts of the AD part of the conductivity are written as $A(z,d,p)f(\omega)$ and $B(z,d,p)g(\omega)$, respectively. It is shown that when $p<p_c$, $f(\omega)=\omega$ and $g(\omega)=\omega^2$, regardless of the dimensionality; at $p=p_c$, $f(\omega)=g(\omega)=\omega^{d/(d+2)}$ if $1<d<2$, $f(\omega)=g(\omega)=(-\omega\ln\omega)^{1/2}$ if $d=2$, and $f(\omega)=g(\omega)=\omega^{1/2}$ if $d>2$; when $p>p_c$, $f(\omega)=g(\omega)=\omega^{d/2}$ if $1<d<2$, $f(\omega)=-\omega\ln\omega$ and $g(\omega)=\omega$ if $d=2$, $f(\omega)=\omega$ and $g(\omega)=\omega^{d/2}$ if $2<d<4$, $f(\omega)=\omega$ and $g(\omega)=-\omega^2\ln\omega$ if $d=4$, and $f(\omega)=\omega$ and $g(\omega)=\omega^2$ if $d>4$. The coefficients $A(z,d,p)$ and $B(z,d,p)$ exhibit critical behavior in d at $d=1$, 2, and 4, and in p at $p=p_c$. For $p\gtrsim p_c$, $A(z,d,p)$ behaves as $(p-p_c)^{-\mu(d)}$ and $B(z,d,p)$ behaves as $(p-p_c)^{-\nu(d)}$. Here $\mu(d)=d/2$ for $1\leq d\leq 2$ and $\mu(d)=1$ for $d\geq 2$; $\nu(d)=d/2$ for $1<d\leq 4$ and $\nu(d)=3$ for $d>4$. For $p\lesssim p_c$, and $d\neq 2$, $A(z,d,p)$ behaves as $(p_c-p)^{-\mu'(d)}$ and $B(z,d,p)$ behaves as $(p_c-p)^{-\nu'(d)}$ where $\mu'(d)=2/d$ for $1\leq d<2$, $\mu'(d)=1$ for $d>2$; $\nu'(d)=4$ for $d=1$, $\nu'(d)=1+4/d$ for $1<d<2$, $\nu'(d)=3$ for $d>2$. For $d=2$, and $p<p_c$, A and B have a logarithmic dependence on p_c-p. Strong and weak criteria of localization are defined. It is suggested that the strong localization is always absent when $p\leq p_c$ and localization in the weak sense takes place even when $p_c<p\leq 1$ if $d\leq 2$. (40 refs.)

119535 **Unified theory of AC and DC hopping conductivity in disordered systems.** S.Summerfield.
Univ. Warwick, England thesis, Sept. 1982
The theory of electron transport via hopping between localised states is developed within the framework of the rate equation approach and in particular the a.c. and d.c. conductivity and Hall mobility are considered. The existence of substantial experimental data on the a.c. and d.c. conductivities motivates the development of a unified theory for these quantities. The conductivity problem has two congruent representations; either a single particle random walk on a random lattice or an equivalent electrical circuit may be considered. In this work the author examines both approaches and compares and contrasts the methods used. Previous unified theories were exclusively based on the random walk approach and methods for evaluating the associated average Green's function; these methods are critically reviewed and extended. The equivalent circuit approach is then examined and a new theory is formulated which is simple to develop and yields improved results which agree well with asymptotic formulae and computer simulation data. Experimental data on a variety of systems is analysed Finally the hopping Hall effect is considered.

72.15 ELECTRONIC CONDUCTION IN METALS AND ALLOYS

119536 **Metallic conductivity of copper phthalocyanine—carbon black composites.** W.Waclawek, M.Kulesza, M.Zabkowska (Pedagogical Univ., Czestochowa, Poland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.673-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Electrical conductivity and thermoelectric power for copper phthalocyanine—carbon black composites were measured. For some composites metallic behaviour was found. (9 refs.)

119537 **Electrical and structural properties of a new conducting polymer: pyrolytic poly (*p*-phenylene-1,3,4-oxadiazole).** M.Murakami, H.Yasujima, Y.Yumoto, S.Mizogami, S.Yoshimura (Res. Dev. Corp. of Japan, Kawasaki, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.705-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Poly (*p*-phenylene-1,3,4-oxadiazole) films are pyrolyzed at various temperatures and their electrical and structural properties were investigated. The pyrolyzed films were composed of both extended eletronic states which contribute to a temperature-independent metallic conductivity (up to 510 S/cm) and localized states giving rise to a variable range hopping motion of electrons. The structure was thought to be a graphite-like crystal having condensed aromatic layers with nitrogen-containing heterocyclic rings. (12 refs.)

119538 **Ionic limit in graphite-fluoroarsenate intercalation compounds.** J.E.Fischer (Moore School of Electrical Engng., Univ. of Pennsylvania, Philadelphia, PA, USA), J.Milliken.
J. Phys. Colloq. (France), vol.44, no.C-3, p.723-7 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Measurements of electrical conductivity, optical reflectance and F_2-uptake suggest an ionic limit around C_{20} in graphite-fluoroarsenate compounds. Oxidation beyond this limit introduces carrier scattering centers in the form of covalent C-F bonds as deduced from measurements of conductivity versus temperature and XPS. (11 refs.)

119539 **Synthesis and physical properties of dimethyl trimethylene tetrathia-fulvalenium salts.** P.Delhaes, E.Dupart, J.Amiell, C.Coulon (Centre de Recherche Paul Pascal, Univ. de Bordeaux I, Talence, France), J.M.Fabre, L.Giral, D.Chasseau, B.Gallois.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1239-42 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
This work is devoted to an unsymmetrical substituted TTF: the dimethyl-4-5 trimethylene 4′5′ tetrathiafulvalene (DMtTTF) which has been synthetized. A new series of radical cation salts have been prepared by electrochemistry $DMtTTF_2$-X′ (X′=ClO_4, BF_4^-, PF_6^-). These materials are isomorphous with the TMTTF salts; they exhibit a metallic DC electrical conductivity below room temperature ($\sigma_{RT}=60$-$100\ \Omega^{-1}\ cm^{-1}$). From EPR investigation the onset of an antiferromagnetic state is detected around 10K. (8 refs.)

119540 **New conducting iron complexes derived from the 1,3-dithiol-2-thion-4,5-dithiolate ligand $(DMIT)^{2-}$.** F.Kubel, J.Strahle (Inst. fur Anorganische Chem., Univ. Tubingen, Tubingen, Germany), P.Cassoux.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1265-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Partial oxidation of the square planar complex Fe $(dmit)_2^-NBu_4^+$ yields metal organic complexes with high conductivity in the range of $10^{-2}\ \Omega^{-1}$ cm^{-1}. The oxidation can be carried out by chemical or electrochemical methods. The formation of a π-donor acceptor complex with TTF leads to highly conductive compounds, as well. By the reaction of the oxidized product with pyrazine a conducting polymeric compound is formed, in which pyrazine acts as a bridging ligand. (12 refs.)

72.15C Electrical and thermal conduction in amorphous and liquid metals and alloys

119541 On the applicability of the nearly free electron model to resistivity calculations for liquid metals. J.Gorecki (Internat. Centre for Theoretical Phys., Trieste, Italy), J.Popielawski.
J. Phys. F (GB), vol.13, no.10, p.2107-14 (Oct. 1983).
Resistivity calculations based on the nearly free electron model are presented for many noble and transition liquid metals. The triple-ion correlation is included in the resistivity formula according to the self-consistent quasi-crystalline approximation (SCQCA). Two different methods for describing the conduction band are used. The problem of applicability of the nearly free electron model to different metals is discussed. (18 refs.)

119542 Electronic properties of Cu-Ti metallic glasses. U.Mizutani (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan), N.Akutsu, T.Mizoguchi.
J. Phys. F (GB), vol.13, no.10, p.2127-36 (Oct. 1983).
The electronic properties of $Cu_{1-x}Ti_x$ metallic glasses ($x=0.4$, 0.5 and 0.6) have been studied through measurements of the low-temperature specific heat, the magnetic susceptibility and the electrical resistivity. The electronic specific heat coefficient increases with increasing Ti content. This behaviour is consistent with the UPS results and indicates the dominant contribution of the Ti 3d states at E_F. The magnetic susceptibility of the amorphous phase is temperature independent and is of the order of 10^{-4} EMU $mol.^{-1}$. It also increases with increasing Ti content. The presence of a large orbital paramagnetism is deduced and attributed to the unfilled d states at E_F. The electrical resistivity increases with decreasing temperature for all alloys studied. The Ziman theory cannot be applied for such highly resistive alloys. The low-temperature resistivity below 100K does not fit to the relation $\rho=\rho_0-AT^2$ ($A>0$), suggesting that an extra scattering mechanism is present and supersedes the effect due to the temperature dependence of the Debye-Waller factor. (24 refs.)

119543 Electrical, optical and glass transformation properties of amorphous solids—a review. C.A.Majid (Pakistan Inst. of Nuclear Sci. & Technol., Rawalpindi, Pakistan).
Nucleus (Pakistan), vol.20, no.1, p.23-35 (Jan.-March 1983). [received: Oct. 1983]
In this paper electrical conduction, photoconduction and optical absorption in amorphous solids are reviewed. A significance of the energy band-gap concept as applied to these solids is discussed. A method of obtaining this parameter from the electrical conductivity, photoconductivity and the optical absorption measurements is given. Different energy band models used to describe the electrical behaviour of these solids are also reviewed. The behaviour of an amorphous solid toward electrical contacts is discussed. A brief description of the glass transformation phenomenon is also given. (63 refs.)

119544 Deviations from Matthiessen's rule in the nickel-chromium system. Y.D.Yao (Inst. of Phys., Acad. Sinica, Taipeh, Taiwan), S.Arajs, E.E.Anderson.
Phys. Status Solidi a (Germany), vol.79, no.1, p.327-30 (Sept. 1983).
The deviations from Matthiessen's rule are studied between 4 and 300K for Ni-Cr alloys containing Cr up to 27 at.%. For Ni=Cr alloys with Cr concentration smaller than about 5 at.%, the deviations from Matthiessen's rule of the resistivity can be explained by a two-current model. However, this model is not valid for Ni-Cr with Cr concentration larger than about 11 at.%. (18 refs.)

119545 Charge transport study on single crystals of β-LiAl. T.Asai, M.Hiratani, S.Kawai (Inst. of Sci. & Industrial Res., Osaka Univ., Ibaraki, Japan).
Solid State Commun. (USA), vol.48, no.2, p.173-6 (Oct. 1983).
Charge transport properties of β-LiAl were studied in the composition range of 48.0-50.2 at.%Li. Measurements were made on single crystal samples and down to the liquid He temperature. The resistivity changes linearly with temperature above 125K, with a thermal coefficient of 72-95 nΩ cm K^{-1}. The Matthiessen law was obeyed very well. A component dependent on temperature, which was described by the Gruneisen formula is insensitive to a change of the chemical composition. On the other hand, the residual resistivity depends largely on the composition and contributes up to 58% of the total resistivity in $Li_{0.502}Al_{0.498}$. It is chiefly due to the substituted Li atoms on the Al sublattice. (13 refs.)

72.15G Galvanomagnetic and other magnetotransport effects

119546 Extraordinary Hall resistivity in amorphous terbium-iron thin films and its temperature dependence. R.Malmhall (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5128-31 (Sept. 1983).
Measurements of the extraordinary Hall effect are performed as a function of temperature for amorphous Tb-Fe thin films of compositions close to 21 and 25 at.% Tb. The experimental results indicate that the Fe sublattice gives the dominant contribution to the extraordinary Hall effect. (24 refs.)

119547 Electronic properties of $Ca_{1-x}Al_x$ metallic glasses. U.Mizutani (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan), T.Matsuda.
J. Phys. F (GB), vol.13, no.10, p.2115-25 (Oct. 1983).
The electronic properties have been studied of four $Ca_{1-x}Al_x$ metallic glasses ($x=0.25$, 0.30, 0.35 and 0.40) prepared by liquid quenching. The measurements involved are the electrical resistivity in the range 2-700K, the Hall coefficient at 77-300K, the low-temperature specific heat at 1.5-6K and the magnetic susceptibility at 77-600K. All experimental data indicate a non-free-electron behaviour. The effective electron concentration and the Fermi momentum are deduced from the Hall coefficient and found to be far below the free-electron values. Both the electronic specific heat coefficient and the magnetic susceptibility decrease with increasing Al content. The relatively large paramagnetism suggests the presence of d-character states at the Fermi level. The electrical resistivity is empirically found to obey the relation $\rho=\rho_0-BT^{1.2}(B>0)$ below 120K and to be proportional to temperature with a negative TCR in the range 120-400K. (15 refs.)

119548 Hall effect in Ni-rich $Fe_xNi_{80-x}B_{18}Si_2$ amorphous alloys. J.Ivkov, Z.Marohnic, E.Babic, M.Miljak (Inst. of Phys., Zagreb Univ., Zagreb, Yugoslavia), H.H.Liebermann.
J. Phys. F (GB), vol.13, no.10, p.2137-45 (Oct. 1983).
The Hall resistivity of amorphous $Fe_xNi_{80-x}B_{18}Si_2$ alloys ($x=0$, 5, 8, 10, 12 and 15) has been measured in the paramagnetic region. Except for $x=0$ these alloys are ferromagnetic with Curie temperatures $T_C \leq 316K$. For the separation of the normal and anomalous Hall coefficients the authors also measured the field and temperature dependence of the magnetisation in the corresponding temperature interval. The normal Hall coefficient $R_0=-(1\pm0.1)\times10^{-10}$ m^3 A^{-1} s^{-1} was roughly independent of x. The anomalous Hall coefficient R_s was positive, a factor of one hundred bigger, and it increased with x. The results for R_0 and R_s are compared with those for similar systems and discussed in terms of the recent theoretical models. (18 refs.)

119549 Correlation between magnetoresistance and magnetization in *Ag*Mn and *Au*Mn spin-glasses. A.K.Majumdar (Inst. fur Angewandte Kernphys., KFA Karlsruhe, Karlsruhe, Germany).
Phys. Rev. B (USA), vol.28, no.5, p.2750-4 (1 Sept. 1983).
Magnetization has been measured between 2 and 77K and mostly up to fields of 20 kOe in *Ag*Mn (1.1 and 5.4 at.%) and *Au*Mn (1.8 and 4.6 at.%) spin-glass samples where the transverse magnetoresistance was measured earlier. It is found, for the first time, that over a wide range of temperature and magnetic field the negative magnetoresistance varies as the square of the bulk magnetization resulting in an universal curve in the spin-glass regime. The constant of proportionality is independent of the Mn concentration. A theroetical justification is provided in terms of existing theories. (13 refs.)

119550 Application of the Pippard-Klemens-Jackson theory of longitudinal magnetoresistance to a model of scattering on the Fermi surface of copper, silver, and gold. L.Dallaire, J.Destry (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada).
Phys. Rev. B (USA), vol.28, no.6, p.2947-56 (15 Sept. 1983).
The authors present the results of a calculation of ρ_∞/ρ_0 (the ratio of the electrical resistivity in the saturation regime to the zero-field value) as a function of temperature in the range 0-40K, in the approximation of the small-angle scattering model. A mechanism is introduced whereby electrons (which would otherwise be scattered at the intersection of the Fermi surface with the Brillouin-zone boundary) avoid such scattering. This reduces the magnetosresistance from its value in the absence of this mechanism. They find that their values of ρ_∞/ρ_0 are very close to those measured by Powell et al. (Phys. Kondens. Mater. 9, 104, 1969) for the (100) and (110) orientations in copper, and in good agreement with unpublished data on the (111) orientation by the same authors. Finally, using their model they calculate values of ρ_∞/ρ_0 versus temperature in the range 0-40K, for silver and for fold, for the (100), (110), and (111) orientations. (9 refs.)

119551 Nondiffusion penetration of low-frequency electromagnetic waves into bismuth. V.T.Dolgopolov, P.N.Chuprov (Inst. of Solid-State Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1325-30 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2287-95 (Dec. 1982). [received: Oct. 1983]
An experimental study was made of the penetration of a large-amplitude low-frequency alternating field into the interior of bismuth single crystals at helium temperatures. It was found that inside the metal a wave had a sharp front and the sign of the magnetic field changed across the front. Such a wave traveled without significant damping over distances considerably greater than the skin layer depth. The shape of the wave front was influenced by the effects of a nonlocal coupling between the electrical field and the current; moreover, a magnetic field gradient influenced the conductivity of the compensated metal. (8 refs.)

119552 Doping of polyacetylene films to the metallic state with $PtCl_4$ and $H_2PtCl_6.6H_2O$. Y.Cao, K.Guo, M.Wan, P.Wang, R.Qian (Inst. of Chem., Acad. Sinica, Beijing, China), F.Wang, X.Zhao.
Polym. Commun. (GB), vol.24, no.10, p.300-2 (Oct. 1983).
Polyacetylene has been doped with $PtCl_4$ and $H_2PtCl_6.H_2O$ to form an electrically conductive complex. It is shown that doped films can reach the metallic level, as evidenced by voltage-short compaction (VSC) measurement. Preliminary X-ray photoelectron spectroscopy (XPS) results show that, upon doping, oxidation of the polyacetylene chain is accompanied by a partial reduc-

tion of Pt^{4+} to Pt^{2+} and the dopant anion is a $PtCl_6^{2-}$ for both $PtCl_4$ and $H_2PtCl_6.6H_2$ doped $(CH)_x$. (10 refs.)

119553 Coordinated study of nearly metallic polyacetylene: role of solitons. A.J.Epstein, H.Rommelmann, R.Bigelow, H.W.Gibson, D.M.Hoffman, D.B.Tanner (Xerox Webster Res. Center-W114, Webster, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.61-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Reports the results of a coordinated study of the structural, optical, magnetic and transport properties of cis and trans polyacetylene slow doped with iodine to nearly metallic levels, i.e. $[CH(I_3)_y]_x$, $1.0<y<5.0$. Cis and trans doped material have similar structure, with essentially all charges going into soliton states. The data are shown to be in agreement with a new mechanism of charge transport in polyacetylene, variable range hopping among soliton-like levels. (29 refs.)

119554 Polyacetylene: the search for solitons. S.Roth, K.Ehinger, K.Menke, M.Peo, R.J.Schweizer (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.69-76 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Electric, magnetic and optical experiments on polyacetylene are reviewed and new data are presented concerning Raman studies of the AsF_5-induced isomerisation of cis samples, ESR results implying the coexistence of localized and itinerant spins even in slowly doped films at all doping levels, and time-resolved photoresponse of trans-polyacetylene in the nsec regime. It is argued that at present there is still very little direct experimental evidence for soliton motion in polyacetylene. (38 refs.)

119555 Doping of $(CH)_x$ films with metal penta- and hexafluorides. H.Selig, J.H.Holloway, A.Pron, D.Billaud (Hebrew Univ., Jerusalem, Israel).
J. Phys. Colloq. (France), vol.44, no.C-3, p.179-82 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Conductivity measurements have shown that exposure of polyacetylene films to the vapours of metal hexafluorides and pentafluorides causes them to be doped to the metallic state. Inverse correlations exist between the maximum conductivities attainable and the electron affinities of the hexafluorides or the fluoride ion affinities of the pentafluorides. (13 refs.)

119556 Depinning of charge carriers in n-type semiconducting polyacetylene. J.J.Andre, M.Bernard, B.Francois, C.Mathis (Centre de Recherches sur les Macromolecules, Strasbourg, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.199-202 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The solvation of cations has been used to show experimentally the importance of the binding energy between ionic impurities and charge carriers on the mechanisms of conductivity. Moreover spin carriers appear to interact with the charge carriers either by a binding energy (polaron) or by an exchange term (intersoliton hopping). (9 refs.)

119557 Hopping conduction in lightly-doped polyacetylene. D.Emin (Sandia Nat. Labs., Albuquerque, NM, USA), K.L.Ngai.
J. Phys. Colloq. (France), vol.44, no.C-3, p.471-5 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The charge transport in lightly doped polyacetylene involves severely localized electronic states which are strongly coupled to the atomic motion. (16 refs.)

119558 Dopant flexibility and processability studies with electrically conductive, face-to-face metallomacrocyclic polymers. T.Inabe (Dept. of Chem., Northwestern Univ., Evanston, IL, USA), J.W.Lyding, M.K.Moguel, T.J.Marks.
J. Phys. Colloq. (France), vol.44, no.C-3, p.625-31 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
In doping experiments on the cofacially arrayed phthalocyanine polymer $[Si(Pc)O]_n$ using high potential quinone, halogen, or nitrosyl electron acceptors, the achievable degree of partial oxidation, the inhomogeneity of the doping process, and the conductivity mechanism remain remarkably constant. Using wet spinning techniques, it has proven possible to prepare electrically conductive fibers of $[Si(Pc)O]_n$ alone or blended with the high performance aramid polymer Kevlar. (18 refs.)

119559 Synthesis and properties of conducting bridged macrocyclic metal complexes. M.Hanack, A.Datz, W.Kobel, J.Koch, J.Metz, M.Mezger, O.Schneider, H.-J.Schulze (Inst. fur Organische Chem., Univ. of Tubingen, Tubingen, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.633-7 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The synthesis and the properties of polymeric phthalocyaninato-metal complexes with Fe, Ru and Co as the central metal atom are described. $TPPH_2$ and $taaH_2$ are also used as macrocycles. In addition to pyrazine (pyz) and 1,4-diisocyanobenzene (dib) the cyano-group is used as a bridging ligand for the first time, such leading to μ-cyanophthalocyaninatocobalt(III). (7 refs.)

119560 Conducting partially oxidized group IIIA halo-phthalocyanines. D.C.Weber, P.Brant, R.S.Nohr, S.G.Haupt, K.J.Wynne (Naval Res. Lab., Washington, DC, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.639-44 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors report results of doping Group IIIA phthalocyanine fluorides and chlorides with nitrosonium salts of BF_4^- and PF_6^-. Although the chloride system is not polymeric it exhibits properties similar to the polymeric fluoride system. (8 refs.)

119561 DC and microwave conductivity of $FeCl_3$-doped polyparaphenylene $(p\text{-}C_6H_4)_x$. H.Stubb (Semiconductor Lab., Tech. Res. Centre of Finland, Espoo, Finland), H.Isotalo, P.Kuivalainen, J.J.Lindberg, P.Raatikainen, C.Holmstrom.
J. Phys. Colloq. (France), vol.44, no.C-3, p.737-40 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
DC and microwave conductivity and dielectric constant measurements on $FeCl_3$-doped $(C_6H_4)_x$ are reported. It is shown that in lightly doped samples Kivelson's intersoliton hopping conduction model as modified and applied to polaron and bipolaron states fits well. In heavily doped samples variable range hopping seems to dominate and reasonable values for Mott's parameters are found. (11 refs.)

119562 Electrical and magnetic properties of poly p-azophenylene. F.Barbarin, G.Berthet, J.P.Blanc, M.Dugay, C.Fabre, J.P.Germain, H.Robert (LERM, Aubiere, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.749-52 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Conductivity and paramagnetic properties of virgin and doped poly p-azophenylene (PPN) are investigated. AsF_5 doping does not lead to a conductive material while iodine doped PPN reaches a conductivity of 10^{-5} $(\Omega cm)^{-1}$. Strong oxidizing dopants probably induce the break of the $-N=N-$ links. (8 refs.)

119563 The Bechgaard salts: magnetotransport, dimensionality, spin density waves and the threshold field. J.F.Kwak (Sandia Nat. Labs., Albuquerque, NM, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.839-46 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A review of the metallic-state magnetotransport properties of the superconducting Bechgaard compounds is presented, with emphasis on the unique threshold field associated with the Shubnikov-de Haas effect. Orbit area calculations based on the currently accepted band anisotropy imply nesting of the Fermi surface by an instability at a commensurate wavevector other than the optimal value $(2k_F, \pi/b)$, leading to a model of wavevector commensuration shift at the threshold. The evidence for spin-Peierls ordering as the relevant instability is discussed. Finally, a comment is made regarding the applicability to these materials of any model involving large one-dimensional fluctuations. (28 refs.)

119564 Some properties of $(TMTSF)_2FSO_3$ at low temperature under pressure. D.Mailly, K.Bechgaard, F.Creuzet, T.Takahashi, M.Ribault, D.Jerome (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1025-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have observed a drop of resistivity in $(TMTSF)_2FSO_3$ under pressures higher than 7 kbar at $T=3K$. At $T=0.1K$ the critical magnetic field is 55 kOe along the c* direction, and much higher than 60 kOe along the b* direction. There is no variation of the magnetization associated with the transition. The NMR characteristics are very different from those of other $(TMTSF)_2X$ compounds. (9 refs.)

119565 Low temperature transport measurements on $(TMTSF)_2ClO_4$. Mu-Yong Choi, P.M.Chaikin (Dept. of Phys., Univ. of California, Los Angeles, CA, USA), R.L.Greene.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1067-70 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have studied the resistance and the thermopower of $(TMTSF)_2ClO_4$ as a function of temperature, magnetic field and quick and slow cooling. Kohler plots of the magnetoresistance indicate that the transport mechanism changes below $\sim$30K. The thermopower is particularly sensitive to a magnetic field along the c* direction at low temperatures, and giant quantum oscillations are observed above a threshold magnetic field below $\sim$2K. They present a model in which there is a large scattering in a small region of the Fermi surface and explain its effect on the transport. (14 refs.)

119566 Solitons in bis-tetramethyltetraselenafulvalene hexafluorophosphate $[(TMTSF)_2PF_6]$. E.M.Conwell (Xerox Webster Res. Center, Webster, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1133-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Since $(TMTSF)_2PF_6$ is commensurate, electrons or holes donated by impurities or other defects should go into soliton states in the gap. The contribution to conductivity of carriers in such states can explain otherwise puzzling low temperature transport properties: (1) Hall constant positive for carriers moving parallel to the chains, while thermoelectric power along the chains is negative, transverse to the chains positive; (2) increase in conductivity at microwave frequencies. (24 refs.)

119567 New organic conductors in TTF family. J.M.Fabre, C.Galaine, L.Giral (Lab. de Chimie Organique Structurale, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1153-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Reports the synthesis, separation and purification of new unsymmetrical tetrathiafulvalenes. The electrochemical preparation of their radical cation salts is described along with preliminary results concerning electrical conductivity and crystallographic data of these salts. (13 refs.)

119568 Quasi-one-dimensional conductors based on tetrathiatetracene (TTT) and tetraselenotetracene (TSeT) with metal complex mercury anions: synthesis, structure, properties. V.F.Kaminskii, E.E.Kostuchenko, R.P.Shibaeva, E.B.Yagubskii, A.V.Zvarykina (Inst. of Chem. Phys., Acad. of Sci., Chernogolovka, USSR).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1167-81 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

A number of TTT and TSeT cation-radical salts with halide-mercuric anions have been obtained. The crystal structures of the salts $TTT_3(Hg_2Br_6)$ and $TTT_3(Hg_2Cl_6)$, $TTT_{1.25}(Hg_2I_5)$, $TSeT_3(Hg_2Br_6)$ and $TSeT_3(Hg_2Cl_6)$, $TSeT_2(Hg_2I_6)$, $TSeT_4(Hg_4I_9)$ have been determined. $TSeT_4(Hg_4I_9)$ is of special interest, since it retains the metallic state down to superlow temperatures. (24 refs.)

119569 Two-dimensionality and anisotropy to the conductivity of a mixed valence nickel bisdithiolato-complex. L.Valade, P.Cassoux, A.Gleizes (Lab. de Chimie de Coordination, CNRS, Toulouse, France), L.Interrante.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1183-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The highly conducting electrocrystallized mixed valence $[Ni(dmit)_2]$ $(NBu_4)_{0.29}$ complex (dmit=dimercaptoisotrithion) shows an unusual two-dimensional structure as evidenced by X-ray diffraction methods and anisotropic conductivity measurements. (6 refs.)

119570 Liquid crystalline organic conductors. H.Strzelecka, V.Gionis (CNRS, Thiais, France), J.Rivory, S.Flandrois.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1201-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Introduction of long chain substituents on the phenyls bonded to bi-4-H pyrane and bi-4-H-thiopyrane heterocycles leads to disk-like π-donors. The latter can be transformed into organic conductors with liquid crystalline properties. The synthesis and some physical characteristics of these new materials are given. (10 refs.)

119571 Polypyridinium-TCNQ complex: a new organic conductor. H.Anzai, M.Tokumoto, T.Ishiguro (Electrotech. Lab., Ibaraki, Japan).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1229-34 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

A new organic conductor has been synthesized by the reaction of polypyridinium halides (Cl and Br) with Li-TCNQ in water. The molecular structure was $Py\text{-}(Py^+)_n\text{-}Cl(\text{-}Br).nTCNQ$ where n was 30-100. The room temperature conductivity of compressed samples reached 0.41 S/cm. (4 refs.)

119572 'Organic metals': synthesis of new electron donors derived from bis(chalcogenopyrannylidenes) and 3:3′-bis(1,2-dithiolylidenes). J.Amzil, M.Brutus, G.Le Coustumer, M.Hakiki, J.F.Hemidy, Y.Mollier, J.P.Sauve, M.Stavaux (Univ. de Caen, Caen, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1249-52 (June 1983). In French. (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Charge transfer salts have been obtained from new electron donors: bis(chalcogenopyrannylidenes) and 3:3′-bis(1,2-dithiolylidene) with TCNQ. Electrical and optical properties have been determined on pressed powder at room temperature. (10 refs.)

119573 Phase transition description down to 10K in the first ternary 1D organic conductor: $TMA^+TCNQ^{2/3-}$ $(I_3^-)^{1/3}$. B.Gallois, J.Gaultier (Lab. de Cristallographie, Univ. de Bordeaux I, Talence, France), J.P.Pouget, C.Coulon, A.Filhol.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1307-12 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

X-ray and neutron experiments were performed down to 10K on single crystals of the title compound. Three transitions have been observed respectively at 150K, 95K and 65K. Below $T_t^I=150K$, the occurrence of superstructure reflections characterized by a (0,1/3,0) wave vector allows the description of this first transition as a 'Peierls type' transition, in spite of 3d precursors. it is shown that order degree of the iodine lattice is a relevant parameter of the mechanisms involved in this transition. At 100K, the TCNQ lattice distortion is described looking to recorded structure factors. A change in the iodine pattern at $T_t^{II}=95K$ shows the second transition is a purely structural one. Below 95K, the a* wave vector component shifts and locks at the position 1/6 a* at $T_t^{III}=65K$. (8 refs.)

119574 Diffuse X-ray studies of $TTF_{0.01}TSeF_{0.99}$-TCNQ and DSeDTF-TCNQ. M.Sakai (Dept. of Pure & Appl. Sci., Univ. of Tokyo, Tokyo, Japan), S.Kagoshima, E.M.Engler.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1313-16 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Behaviors of the $2k_F$ and the $4k_F$ charge-density waves (CDW) in $TTF_{0.1}TSeF_{0.9}$-TCNQ, $TTF_{0.01}TSeF_{0.99}$-TCNQ and DSeDTF-TCNQ observed by X-ray scattering are reported. Discussions are made of origins of the $4k_F$ CDW and the interchain interactions among the $2k_F$ CDW. (16 refs.)

119575 High pressure effects in MEM-$(TCNQ)_2$. D.Bloch (Lab. Louis Neel, CNRS, Grenoble, France), J.Voiron, C.Vettier, J.W.Bray, S.Oostra.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1317-20 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

MEM-$(TCNQ)_2$ possesses at room pressure both an electronic transition, associated with a $4k_F$ lattice distortion and a magnetic-to-nonmagnetic transition associated with a $2k_F$ lattice distortion. They disappear above 4 kbar. (10 refs.)

119576 $[H_3NCH_2CH_2NH_3]_{0.82}[Pt(C_2O_4)_2].2H_2O$—a new partially oxidised bis(oxalato)platinate. A.E.Underhill, M.Mizuno (Univ. Coll. of North Wales, Bangor, Wales), K.Krogmann, M.Rosch.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1331-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The preparation of the new I-D conductor $[H_3NCH_2CH_2NH_3]_{0.82}[Pt(C_2O_4)_2].2H_2O$ (en-OP) is described together with the results of structural and electrical conductivity studies. (9 refs.)

119577 The low temperature P-T phase diagram of TTF-TCNQ. C.Hartzstein, V.Zevin, M.Weger (Racah Inst. of Phys., Hebrew Univ. of Jerusalem, Jerusalem, Israel).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1335-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

A microscopical mechanism for indirect interaction between similar chains '2a' apart is proposed in order to account for the '4a' commensurate phase at low temperatures. CDW-CDW $2k_F$-$4k_F$ intrachain and $4k_F$-$4k_F$ interchain interactions are included in the free energy and the relevant interaction parameters are estimated. They are large enough to account for the pinning of the '4a' transverse period at low temperatures. The theoretical phase diagram is obtained from the numerical minimization of the free energy and it fairly reproduces the low temperature phases of TTF-TCNQ. (11 refs.)

119578 $4k_F$ and $2k_F$ transitions in the organic conductor: DBTTF-$TCNQCl_2$. K.Mortensen, C.S.Jacobsen, A.Lindegaard-Andersen (Lab. of Appl. Phys., Tech. Univ. of Denmark, Lyngby, Denmark), K.Bechgaard.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1349-52 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Presents experimental studies of the organic conductor DBTTF-$TCNQCl_2$, which exhibits separated electronic-Peierls ($4k_F$) and spin-Peierls ($2k_F$) transitions. The studies include X-ray diffuse scattering, transport and magnetic measurements. (6 refs.)

119579 Conducting cation-radical salts based on DBTTF and its selenium analogue, DBTSF. I.Johannsen, K.Mortensen, C.S.Jacobsen, N.Thorup, G.Rindorf (Tech. Univ. of Denmark, Lyngby, Denmark), K.Bechgaard.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1361-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Presents structural, magnetic and transport properties of a series of new cation-radical salts with the general formulas $DBTTF(X)_t$ and $DBTSF(Y)_u$. X may be PF_6 or ClO_4 and Y may be TaF_6, SbF_6 or AsF_6. (3 refs.)

119580 Physical properties of a new highly conducting TCNQ salt: $MPht(TCNQ)_2$. A.Graja, M.Przybylski, G.Sekretarczyk (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland), W.Pukacki, A.Rajchel, M.R.Willis, S.C.Wallwork, G.Mihaly, L.Mihaly.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1365-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The highly conducting $MPht(TCNQ)_2$ salt has been synthesized and characterized. The conductivity is described in terms of 'metal-like' semiconductor with a large, strongly temperature-dependent mobility. The magnetic susceptibility is thermally activated; spins and charge carriers are activated with the same energy. The temperature-dependence of the optical phonons (a_g modes) is studied. (no refs.)

119581 Electrical properties of an irradiated methyl-pyridinium-TCNQ salt. M.Przybtylski, W.Pukacki (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland), L.Zuppiroli.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1369-72 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Fast electrons have been used to irradiate and disorder the organic-semiconductor $NMe3.5MePy(TCNQ)_2$. At low irradiation doses ($\Phi<20$ mC/cm^2) the radiation induced defects are shown to dope the semiconducting samples and increase their room temperature conductivity up to a factor of ten. At higher doses, a localization process dominates conductivity and thermopower. (8 refs.)

119582 Electric conductivity and thermopower of quasi one-dimensional $(perylene)_2(AsF_6)_{0.75}(PF_6)_{0.35}.0.85CH_2Cl_2$ crystals. K.Bender, D.Schweitzer, H.J.Keller (Max Planck-Inst., Heidelberg, Germany).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1433-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The temperature dependence of the conductivity parallel and perpendicular to the stack axis as well as of the thermopower S of $(pe)_2(AsF_6)_{0.75}(PF_6)_{0.35}.0.85CH_2Cl_2$ crystals is reported. (9 refs.)

119583 Long range phase coherence in the current-carrying charge density wave state. G.Gruner, A.Zettl (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1631-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Various experiments involving the joint application of AC and DC driving fields, $V=V_{dc}+VP_{ac}\cos\omega t$, are reported in the linear chain compound $NbSe_3$ (1) the direct observation of current oscillations with the relation between frequency f_0 and CDW current I_{CDW} given by $I_{CDW}/f_0=2en(T)/n(0)$ where n(T) is the number of condensed electrons; (2) the AC field induced steps in the I-V curve[3]; and (3) changes in the AC response when $\omega/2\pi=f_0$. The analysis of these experiments leads to coherent CDW responses, which involve the total volume of the specimens, strongly suggesting long range phase coherence in the current carrying state. While the single coordinate descriptions account for these observations, they do not explain the broad band noise and the finite width of the narrow band peaks. A short comparison with recent theoretical attempts to explain these observations will be given. (18 refs.)

119584 Temperature dependence of the upper threshold field E_{T1} in $NbSe_3$. K.Tsutsumi, T.Tamegai (Dept. of Pure & Appl. Sci., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1677-80 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors measured the temperature dependence of the upper threshold field E_{T1} in $NbSe_3$ single crystals with the various residual resistivity ratios. The temperature dependence of E_{T1} is discussed by Fukuyama-Lee weakly impurity pinning model. (9 refs.)

119585 Charge density wave fluctuations in $TaSe_3$ and $NbSe_3$. J.Richard, H.Salva, M.C.Saint Lager, P.Monceau (Centre de Recherches sur Les Tres Basses Temperatures, CNRS, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1685-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors report a study of the influence of charge density wave fluctuations on transport properties of TaS_3 (with the orthorhombic unit cell) and of $NbSe_3$. (7 refs.)

119586 Microwave harmonic mixing in $NbSe_3$. W.Mayr, A.Philipp, K.Seeger (L. Boltzmann Inst. fur Festkorperphys., Wien, Austria).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1693-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
By mixing a microwave and its second harmonic at the nonlinear current voltage characteristic of niobium triselenide a small DC signal is generated between the ends of the filamentary sample. The temperature dependence is in qualitative agreement with theoretical calculations based on Bardeen's theory of tunneling of charge density waves although some details of both the experimental results and the theory are not yet fully understood. (5 refs.)

119587 Influence of Mo- and Co-impurities on the non-Ohmic DC-conductivity in $NbSe_3$. H.Gruber, H.Sassik (Inst. fur Festkorperphys., Tech. Univ. Graz, Graz, Austria).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1717-20 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The effect of Co and Mo-impurities on the non-Ohmic DC-conductivity between 4.2K and 300K has been studied. The suppression of the anomalous behaviour of the resistivity for Co- and Mo-impurities is differently strong. (6 refs.)

119588 AC conductivity of near-commensurate charge density waves—application to $NbSe_3$ and TaS_3. B.Horovitz, S.E.Trullinger (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1721-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The AC conductivity of a charge density wave with a low phase kink density is evaluated. The results explain the broad crossover regime of $NbSe_3$ as compared with the similar but more commensurate TaS_3. When TaS_3 becomes commensurate ($T \lesssim 130K$) its critical field should decrease (in agreement with experiment) and its AC response should increase and slightly sharpen. (11 refs.)

119589 Strong electron-phonon interaction in quasi-one-dimensional conductor $M_xV_2O_5$ systems. H.Nagasawa, T.Erata, M.Onoda, H.Suzuki (Inst. of Phys., Univ. of Tsukuba, Tsukuba, Japan), Y.Kanai, S.Kagoshima.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1737-40 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
In quasi-one-dimensional conductor β-$M_xV_2O_5$, the CDW states were observed below about 200K by X-ray diffraction. The V Knight shift results show the spin-singlet ground state of V(4+) ion pair (BIPOLARON) is realized. On the basis of magnetic relaxation measurements, the high conductivity parallel to the chain axis in β-$Na_{.40}V_2O_5$ is interpreted as the collective motion of BIPOLARONS. (11 refs.)

119590 Solitons with adjustable charge in a commensurate Peierls insulator. S.Kivelson (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2653-8 (1 Sept. 1983).
The author considers a one-dimensional electron gas with a half-filled band in which the electrons are coupled to both intersite and intrasite lattice distortion. In the region of parameter space in which both types of distortion develop nonzero expectation values, a new class of soliton which spontaneously breaks the charge conjugation symmetry of the model appears as the lowest-lying electronic excitation of the system. The soliton charge is a continuous function of the coupling constants. (11 refs.)

119591 Spatial dispersion effects in the conductivity of one-dimensional metals. L.V.Chebotarev, E.A.Kaner (Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Solid State Commun. (USA), vol.48, no.4, p.333-6 (Oct. 1983).
The dependence of the conductivity of a 1D conductor on the wavevector q is calculated and analysed taking into account both the localization phenomenon and the fluctuations of the electronic collision frequency. In the high frequency region the conductivity is given by the Drude formula (allowing for the spatial dispersion), being averaged over the fluctuations of the collision frequency. In the low frequency limit, owing to the predominant effect of localization, the frequency dependence type with finite q differs significantly from that with $q=0$. The dissipative conductivity decreases with growing q and has a power law dependence with the exponent depending on q. (4 refs.)

119592 On the nonlinear field-effect of orthorhombic TaS_3. Zhang Dian-lin (Inst. of Phys., Chinese Acad. of Sci., Beijing, China).
Solid State Commun. (USA), vol.48, no.4, p.369-71 (Oct. 1983).
The true DC measurement of electrical field effect on the resistivity of orthorhombic TaS_3 in the CDW state was performed for the first time with extremely short distances between the contacting leads. Very weak nonlinear effect was observed up to 1300 V cm^{-1}. A distinct resistivity-increasing effect was found, which cannot be understood within the framework of any currently available theories. The author proposes a transverse tunneling model to account for this anomaly. (10 refs.)

119593 Linear conductance of very short semiconductor samples. S.Eranen, J.Sinkkonen, T.Stubb.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.45-9 (1983).
Using the Landauer formula, the authors describe the length-dependent linear conductance in intrinsic semiconductor samples, which are much shorter than thermal scattering mean free paths and are sandwiched between two metallic plates. The semiconducting region has been modeled as a variable length Kronig-Penney chain, the transmission coefficient of which can easily be obtained using the ordinary transfer matrix method. Even for a sample thickness of one atomic layer only, the transmission coefficient reveals some features of the band structure of the infinite chain, which then becomes more and more evident with increasing sample length. In short samples, the current flows by tunneling through regions near the contact Fermi level, resulting in strongly length-dependent conductance. For long samples with a sufficiently deep transmission gap at forbidden energies, the conductance finally saturates near the thermionic emission value. (16 refs.)

119594 Dynamic dielectric response to carrier-carrier interactions in narrow-gap semiconductors. J.R.Meyer, F.J.Bartoli (Naval Res. Lab., Washington, DC, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1752-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
For the first time, the dynamic dielectric response of the screening medium within a narrow-gap semiconductor is properly taken into account in treating electron-hole scattering. The interaction potential is shown to have the strikingly simple form $U(\mathbf{q},\omega)=V(\mathbf{q})/\epsilon(q,\omega=\mathbf{q}.\mathbf{v}_h)$, where $V(\mathbf{q})$ is the bare Coulomb potential, $\mathbf{v}_h$ is the hole velocity, and $\epsilon(q,\omega)$ is the dielectric constant of the medium. The screening medium is assumed to consist of core electrons, lattice ions, free electrons, and free holes. The effects of dynamically treating the slowly responding lattice ions and free holes are discussed in detail. It is shown that previous approximations of employing the static and high frequency limits lead to significant error in the calculated electron-hole scattering mobility. (9 refs.)

119595 The scattering of charge carriers in large electron-hole drops in germanium. S.V.Bogdanov, Ya.E.Pokrovskii (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1350-3 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2329-34 (Dec. 1982). [received: Oct. 1983]
The temperature dependence of energy absorption from an alternating magnetic field on photoexcitation of germanium, due to excitation of eddy currents in the conducting medium, has been studied. The mobility of free electrons and holes and the mobility in large electron-hole drops are determined from the dependence of this absorption on the strength of the DC magnetic field. It is shown that between 2 and 4.2K the mobility of both free and condensed charge carriers is determined by scattering by acoustic phonons. (9 refs.)

119596 The influence of spin-electron interaction on characteristics of current carriers in ferrimagnetic semiconductors. A.A.Trushchenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1388-93 (Sept. 1983). In Russian.
A weak exchange *s-d* or *s-f* interaction of conduction electrons with spins of magnetic atoms is considered in ferrimagnetic semiconductors with two collinear magnetic sublattices. The conduction electron energy shift is determined in a spin-wave approximation by the method of Green's temperature functions. It is true when spin-moments of the sublattice ions are equal but their *g*-factors are different, which results in unequal magnetic moments of sublattices. (7 refs.)

72.20F Low-field transport and mobility; piezoresistance

119597 Specific electrical resistivity of TiC-C system alloys in the temperature range 300-2000K. S.G.Gorinskii, O.V.Fedorenko, A.R.Beketov, A.F.Kokorin (S.M. Kirov Polytech. Inst., Urals, USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1475-8 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1717-20 (Oct. 1982). [received: Sept. 1983]
The specific electrical resistivity was investigated in the temperature interval 300-2000K for TiC-C system alloys obtained by arc melting. A model for the electron transport is suggested. Using known values for the specific electrical resistivity of titanium carbide and quasi-monocrystalline graphite the specific electrical resistivity of the alloys studied has been studied and results are in satisfactory agreement with the experimental data. (7 refs.)

119598 Experimental study of the electrical conductivity of the monocrystalline trioxide of molybdenum, MoO_3. A.Steinbrunn, H.Reteno, C.Lattaud (Lab. de Recherches sur la Reactivite des Solides, Faculte des Sci. Mirande, Dijon, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.523-8 (June 1983). In French.
Pure single crystals of MoO_3, for electrical conductivity measurements, were carefully grown by physical vapor transport. DC conductivity measurements were performed in the 100-400°C temperature range and for partial oxygen pressures between 350 Torr and the dissociation pressure of the oxide. The conductivity value is found to increase with departure from stoichiometry, while the activation energy decreases (0.76 to 0.07 eV). A twinned layer model is proposed in terms of an interaction of the solid with the gas phase: an electronic hopping conduction between Mo^{5+} sites enables one to interpret the results obtained. (18 refs.)

119599 Electrical resistivity of ferrites of the general formula $Mg_{1+t}Fe_{2-2t}Ti_tO_4$(t=0.1, 0.3, 0.4, 0.5). M.A.Semary, M.A.Ahmed (Phys. Dept., Cairo Univ., Giza, Egypt), Y.Abbas.
J. Mater. Sci. (GB), vol.18, no.10, p.2890-2 (Oct. 1983).
The electrical resistivity of the ferrites $Mg_{1+t}Fe_{2-2t}Ti_tO_4$ (t=0.1, 0.2, 0.3, 0.4, 0.5) has been measured in the temperature range of 30 to 300°C. A break in In ρ against $1/T$ around T_c has been observed. This break is associated with a change in the activation energy around the Curie temperature. The conductivity behaviour is discussed in terms of the cation distribution in these ferrites. (9 refs.)

119600 Electronic and electrogalvanic properties of α silver telluride. G.Bonnecaze, A.Lichanot (Inst. Univ. de Recherche Sci., Pau, France), S.Gromb.
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.967-74 (1983). In French.
A study of the electronic and electrogalvanic properties of α silver telluride has been performed on samples whose non-stoichiometry has been determined by coulometric titration with the cell $Ag/AgI/Ag_2Te/Pt$. The data lead to the adoption of a model of Frenkel defects on the silver sublattice that are fully ionised. The homogeneity range is reported from 162 to 508°C: it extends essentially on the tellurium side of the stoichiometric composition. The free energies of formation of the α and β forms of the tellurides whose compositions are near $Ag_{1.6}Te$, $Ag_{1.9}Te$ and $Ag_{2.0}Te$ have been determined between 23°C and 360°C. (25 refs.)

119601 Electrical conduction mechanism in crystal violet dye sensitised with AgI. G.D.Sharma, A.K.Tripathi, D.C.Dube, S.C.Mathur (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
J. Phys. D (GB), vol.16, no.10, p.1977-83 (14 Oct. 1983).
The theory of dark conduction in dyes assumes thermal excitation from the ground state to an excited state, followed by trapping of the hole near the electrode. Electrical conductivity studies on crystal violet (CV), an organic dye of industrial importance, have been carried out in both dark and light conditions. The present paper deals with the effect of field, temperature and electrode materials on the electrical conduction in CV as well as in CV sensitised with AgI. These studies suggest that conduction is mainly due to the charge carriers injected from the electrode into the dye (Schottky-Richardson mechanism) and the electron transfer mechanism. Photo and dark activation energies in the sensitised dye have been calculated. (8 refs.)

119602 Semiconduction in silver orthoarsenate. K.Tennakone (Dept. of Phys., Ruhuna Univ. Coll., Matara, Sri Lanka).
J. Solid State Chem. (USA), vol.49, no.2, p.256-7 (Sept. 1983).
Silver orthoarsenate is found to be an n-type semiconductor of electron activation energy 0.61 eV. Silver orthoarsenate (Ag_3AsO_4) is prepared as a brick red powder consisting of cubic crystals. To measure the resistivity the powder was compacted into a glass tube (diameter 0.8 cm) and pressed between carbon electrodes to a pressure $\sim 10^5$ Pa, so that a pellet of length ~ 0.5 cm is formed. At this pressure the effect of grain boundaries becomes negligible and the conductivity characteristics are found to be independent of the polarity. (4 refs.)

119603 Electrical transport properties of iodine doped polyacetylene. K.Ehinger, W.Bauhofer, K.Menke, S.Roth (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.115-18 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Measurements of the DC conductivity and the 10 GHz microwave conductivity of iodine doped cis and trans polyacetylene in the temperature range from 4.2K to 300K are reported. At room temperature no sample shows a frequency dependence; at low temperatures, however, the microwave conductivity of moderately doped samples is considerably higher than the DC value. From the magnetoresistance at liquid helium temperature, an 'effective' Hall mobility in the order of magnitude of $10^2 cm^2/Vsec$ is estimated for samples with various iodine concentrations. (15 refs.)

119604 Electrically conductive polymer-polymer composites. M.E.Galvin, G.E.Wnek (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.151-3 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Conductive composites have been prepared by polymerization of acetylene in polyethylene films followed by iodine doping. The attainment of high conductivity (5-10 S/cm) at low $(CH)_x$ concentrations (~3 wt.%) is explained with a simple percolation model. (4 refs.)

119605 Polaron-soliton model for macroscopic conduction in doped polyacetylene. A.G.MacDiarmid, T.-C.Chung (Dept. of Chem., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.513-16 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The model proposed applies to p- or n-doped $(CH)_x$ in the 'intermediate' doping regime between ca. 0.2% and ca. 7% doping. Since solitons or soliton bands in this regime are either completely empty (p-doping) or completely filled (n-doping), it has been difficult to envisage how either high intra- or inter-chain conductivity can occur. The authors have recently obtained experimental evidence indicating a significant population of positive and negative polarons in p- and n-doped $(CH)_x$, respectively, up to ca. 5% doping levels. This is understandable since an even number of charge in a conjugation sequence gives an even number of solitons whereas an odd number of charges results in one polaron and an even number of solitons. (no refs.)

119606 AC hopping conduction in undoped trans-polyacetylene. J.A.Chroboczek (Max Planck Inst., Grenoble, France), S.Summerfield.
J. Phys. Colloq. (France), vol.44, no.C-3, p.517-20 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors show that within the extended pair approximation (EPA) the transition rate of Miller and Abrahams (1960) accounts better for the behaviour of $\sigma(\tau,\omega)$, and of $\sigma_{DC}(T)$ than that given by Kivelson (1982). (10 refs.)

119607 Electronic and ionic transport properties of electrodeposited polypyrrole films. P.Mirebeau (Lab. de Recherches, Compagnie Europeenne d'Accumulateurs, Clichy, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.579-82 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Polypyrrole films have been electrodeposited on stainless steel electrodes. The author defines the limits (current density, temperature) in which a conductive film can be obtained. The ratio of the electronic conductivity perpendicular to the film surface over the electronic conductivity parallel to the film surface is smaller than 10^3. The dependence of the perchlorate ions diffusion coefficient versus temperature corresponds to an activation energy of 30 kJ/mole. (5 refs.)

119608 Investigation on the physical properties of polypyrrole. F.Devreux, F.Genoud, M.Nechtschein, J.P.Travers, G.Bidan (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.621-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors report transport properties and magnetic resonance measurements carried out on polypyrrole samples. (3 refs.)

119609 Electric conductivity of polyacenic system—toward one-dimensional graphite. T.Yamabe (Dept. of Hydrocarbon Chem., Kyoto Univ., Kyoto, Japan), K.Tanaka, K.Ohzeki, S.Yata.
J. Phys. Colloq. (France), vol.44, no.C-3, p.645-50 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A new material, which is supposed to have a mixed structure of the polyacenic skeletons, has been synthesized. It shows a wide range of electric conductivity according to the preparing process of the carbonization and/or doping. (4 refs.)

119610 Electrically conducting aromatic polymers:poly(phenylene vinylene) and its analogs. J.R.Reynolds (Polymer Sci. & Engng. Dept., Univ. of Massachusetts, Amherst, MA, USA), F.E.Karasz, J.C.W.Chien, K.D.Gourley, C.P.Lillya.
J. Phys. Colloq. (France), vol.44, no.C-3, p.693-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A variety of arylene vinylene compounds including poly(phenylene vinylene) (PPV) and its analogs have been prepared and doped with arsenic pentafluoride to form electrically conducting materials. (5 refs.)

119611 Some new conducting complexes of nickel. G.C.Papavassiliou (Theoretical & Phys. Chem. Inst., Nat. Hellenic Res. Found., Athens, Greece).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1257-60 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The cation-deficient nickel dithiolenes $Z_xNi(C_3S_5)_2$,Z_x $Ni(R_2C_2S_2)_2$ and the mixed valence compounds $Ni(dapn)_2X\ Y_2$ (where: Z=cation; R=CN, SCH_3, etc.; $x \ll 1$; X=Cl, Br; Y=Cl, Br, $C10_4$; dapn=1,2-diaminopropane) have been prepared and studied. (13 refs.)

119612 Pressure effects in $HfTe_5$ and $ZrTe_5$. W.W.Fuller, S.A.Wolf, T.J.Wieting (Naval Res. Lab., Washington, DC, USA), R.C.LaCoe, P.M.Chaikin, C.Y.Huang.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1709-12 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have measured the effect of pressure (0-17 kbar) on the resistivity and the thermopower of $HfTe_5$ and $ZrTe_5$ as a function of temperature. Pressure affects these two materials in different ways. The resistance shows a greater effect than the thermopower. There is a larger effect in $HfTe_5$ than in $ZrTe_5$. Possible explanations in terms of a Fermi surface instability and a semi-metal are given. (8 refs.)

119613 Amorphous silicon-phosphorus layer. A.V.Dvurechenskii, I.A.Ryazantsev, L.S.Smirnov (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR), H.Klose, M.Rieth.
Phys. Status Solidi a (Germany), vol.79, no.1, p.83-6 (Sept. 1983).
EPR, photo- and dark conductivity are investigated for amorphous silicon films prepared by vacuum deposition of the silicon-phosphorus vapour mixture. It is shown that as the phosphorus vapour pressure increases ($p_p \geq 10^{-3}$ Pa) the conductivity decreases the paramagnetic centres with $g=2.0055$ disappear. The temperature dependence of the dark conductivity and EPR data permit the conclusion that the phosphorus doping by vacuum evaporation technique enables one to decrease the localized state density in a-Si down to 10^{17} cm^{-3} eV^{-1}. With a further increase of p_p ($>10^{-3}$ Pa) the n-type conductivity appears. The maximum value of σ is 10^{-3} $(\Omega\ cm)^{-1}$, though the phosphorus concentration in a-Si:P ranges from 10^{19} to 3×10^{22} cm^{-3}. It is found that the a-Si:P layers are characterized by high values of photoconductivity and are thermally stable when heated up to 500°C. (11 refs.)

119614 Electrical studies on $(Mo/W)Se_2$ single crystals. III. Anisotropy in resistivity. M.K.Agarwal, P.D.Patel, O.Vijayan (Dept. of Phys., Sadar Patel Univ., Vallabh Vidyanagar, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.103-8 (Sept. 1983).
For pt.II see ibid., vol.78, p.469 (1983). The anisotropy in resistivity along and across the layers of the layered single crystals in the series $Mo_xW_{1-x}Se_2$ $(0 \leq x \leq 1)$ are studied in the temperature range from 300 to about 600K. The crystals are grown by a direct vapour transport technique. The anisotropy parameters of these crystals have values $\leq 10^6$. The band mass anisotropy (m_a/m_c) is found to be ≈ 10 near the WSe_2-end and $\approx 10^4$ near the $MoSe_2$-end of the system. (23 refs.)

119615 Cation mixing and the AC conductivity of $CdInGaS_4$. A.N.Anagnostopoulos, A.Karoutis (First Lab. of Phys., Aristoteles Univ. of Thessaloniki, Thessaloniki, Greece).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K29-33 (Sept. 1983).
The authors show that the exchange of 1/3 Ga and 1/3 Cd cations explains the frequency-dependent AC conductivity of $CdInGaS_4$, measured parallel to the c-axis of this compound. (11 refs.)

119616 Influence of growth dislocations on low temperature conductivity in irradiated p-germanium. V.P.Dobrego, A.K.Fedotov (Belorussian State Univ., Minsk, Belorussian SSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K45-8 (Sept. 1983).
The correlation between the low temperature conductivity of irradiated samples and the concentration and distribution of growth dislocations is examined. The authors have studied germanium single crystals, gold doped, $N_{Au}=(0.7$ to $1.0)\times10^{15}$ cm^{-3} and weakly compensated by antimony. The growth dislocation density was $D=10^3$ to 10^4 cm^{-2}. The samples studied were irradiated by γ-quanta of ^{60}Co with a fluence of 8×10^{15} cm^{-2}. (10 refs.)

119617 On the hole mobility of $CuGaSe_2$. S.M.Wasim, G.Sanchez Porras (Dept. de Fisica, Facultad de Ciencias, Univ. de Los Andes, Merida, Venezuela).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K65-8 (Sept. 1983).
The authors analyze the mobility data, already published, to account for the different scattering mechanisms of the charge carriers in $CuGaSe_2$ which also gives an estimate of certain band parameters. It is observed that in the bulk sample at lower temperatures the charge carriers are predominantly scattered by ionized impurities, whereas both in the thin film and at higher temperatures in the bulk samples, the main scattering mechanisms are due to acoustic and optical modes. (15 refs.)

119618 Electrical properties of vapour phase grown $(ZnSe)_x(CdTe)_{1-x}$ single crystals. P.Chandrasekharam, D.R.Reddy, B.K.Reddy (Dept. of Phys., Sri Venkateswara Univ., Tirupati, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K103-7 (Sept. 1983).
The electrical properties of $(ZnSe)_x(CdTe)_{1-x}$ are reported for the first time. The conductivity and Hall effect studies were carried out simultaneously on the same samples using the DC van der Pauw technique. However, for as-grown crystals the two-probe method was used. The type of conductivity was determined by the sign of Hall voltage/hot probe test. (8 refs.)

119619 Mobility of carriers in inversion layers in semiconductors. M.V.Krylov, R.A.Suris.
Sov. Phys.-JETP (USA), vol.56, no.6, p.1316-20 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2273-80 (Dec. 1982). [received: Oct. 1983]
A theoretical investigation is made of the influence of the surface roughness on the carrier mobility in inversion layers in semiconductors. A relationship is obtained between this mobility and the main parameters of the roughness: the average height of the projections and the characteristic scale in the tangential direction. The dependence of the mobility on an electric field normal to the surface is found. The temperature dependence of the mobility is studied: in contrast to the well-known Schrieffer theory, the dependence agrees well with the available experimental results. (12 refs.)

72.20H High-field and nonlinear effects

119620 Current injection in an insulator with traps at high fields. A.S.Verma, Y.K.Sharma, S.Mohan (Dept. of Phys, RBS Coll., Agra, India).
An. Fis. Ser. B (Spain), vol.79, no.2, p.105-7 (May-Aug. 1983). [received: Oct. 1983]
Approximate solution for the current-voltage characteristic of the single injection current in solid state diodes with a single set of traps lying above the Fermi level at high fields has been given with the help of the regional approximation method. The effect of a low field region has been also included in the analysis. It is shown that the current-voltage characteristic is started from Ohm's law which finally merges into 3/2-power law trap free regime through two transition regimes. (5 refs.)

119621 Impact ionization of electrons in silicon (steady state). J.Y.Tang, K.Hess (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5139-44 (Sept. 1983).
Monte Carlo simulations of electron impact ionization in silicon are presented which include the pseudopotential band structure as well as collision broadening and higher order effects in the electron-phonon interaction. Conduction in the two lowest conduction bands of silicon is considered. The authors also present new results for the impact ionization probability and deformation potential constants which are obtained by comparing their theory with a variety of experimental results. (13 refs.)

119622 Theory of hot electron emission from silicon into silicon dioxide. J.Y.Tang, K.Hess (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5145-51 (Sept. 1983).
The authors present Monte Carlo simulations of the hot electron emission from silicon into the oxide of metal oxide silicon transistors. The calculations include the pseudopotential band structure and quantum effects such as collision broadening due to the electron-phonon interaction. As a result, the authors present a set of transport parameters which well describes all hot electron effects in silicon (including saturation velocity and impact ionization). They also show that the collision broadening effect leads to an effective barrier lowering and may require that voltages be scaled down far below the interface barrier height of ~3.1 V in order to avoid hot electron emission. 72.20J Charge carriers: generation, recombination, lifetime, and trapping

119623 Time resolved observation of geminate recombination in metal-free phthalocyanine. Z.D.Popovic (Xerox Res. Centre of Canada, Mississauga, Ontario, Canada).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.227-9 (9 Sept. 1983).
Delayed-collection-field measurements of carrier generation and delayed fluorescence in metal-free phthalocyanine have been shown to exhibit the same time dependence. This indicates the existence of geminate electron-hole pairs with survival times extending to tens of milliseconds. (8 refs.)

119624 Compensation densities in n-type $Hg_{1-x}Cd_xTe$ from transport properties of optically generated free carriers. F.J.Bartoli, C.A.Hoffman, J.R.Meyer (Naval Res. Lab., Washington, DC, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1669-71 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Improvements to a photoneutralization technique for accurately determining compensation densities in narrow-gap $Hg_{1-x}Cd_xTe$ are discussed. A more comprehensive theoretical understanding of the electron mobility as a function of optically excited carrier density has been established, incorporating a theory for dynamic dielectric screening in the treatment of electron-hole scattering. In addition, uniform carrier generation has been demonstrated using two-photon absorption of CO_2 laser radiation for compositions in the range $0.24<x<0.27$. This eliminates the need for nonuniformity corrections to the photo-Hall data for appropriate compositions of $Hg_{1-x}Cd_xTe$. Good agreement between theory and experiment verifies the accuracy of the technique. (5 refs.)

119625 Comparison of optically modulated absorption and photoconductivity decay lifetime measurements on HgCdTe. W.A.Radford, J.F.Shanley, O.L.Doyle (Honeywell Electro-Optics Div., Lexington, MA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1700-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The optically modulated absorption (OMA) effect has been examined in *p*-type ($N_A-N_D\approx2\times10^{15}$ cm^{-3}) $Hg_{0.785}Cd_{0.215}Te$. The effect has been used to measure the excess hole lifetime for temperatures between 85 and 250K. The measured lifetimes agree with the results of photoconductivity (PC) decay measurements performed on the same samples. The measured lifetimes also indicate that an Auger process is the dominant recombination mechanism at temperatures above about 150K, while a Shockley-Read-Hall process controls the lifetime below this temperature. In addition, it was found that the OMA signal exhibits extremely large phase-interference effects when coherent radiation is used for the probe beam. These effects have been both experimentally and theoretically investigated. (14 refs.)

119626 Adhesion level parameters in $TlGaS_{2x}Se_{2(1-x)}(0.1\leq x\leq1)$. S.G.Abdullaeva.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.64-6 (1983). In Russian.
The parameters of the adhesion levels in $TlGaS_{2x}Se_{2(1-x)}$ solid solutions have been determined by the method of thermostimulated freeing of the traps. By their energy position the observed adhesion levels are clearly divided into three groups: (0.23÷0.29) eV, (0.32÷0.36) eV and (0.40÷0.44) eV. The concentrations and cross-sections of these levels are evaluated. The levels in question are established to be the fast ones. (8 refs.)

119627 Minority carrier lifetime in n-type Bridgman grown $Hg_{1-x}Cd_xTe$. R.G.Pratt, J.Hewett (Philips Res. Labs., Redhill, England), P.Capper, C.L.Jones, M.J.Quelch.
J. Appl. Phys. (USA), vol.54, no.9, p.5152-7 (Sept. 1983).
Minority carrier lifetimes have been mapped on slices of *n*-type $Hg_{1-x}Cd_xTe$ ($x\sim0.3$) grown by the Bridgman technique. The mean lifetime on a slice has been measured as a function of extrinsic carrier density and composition. Lifetimes at selected positions on slices have been measured as a function of temperature down to 30K. Aging effects have also been investigated. The authors show that the lifetime variation with temperature cannot be explained by direct band-to-band recombination alone. The assumption that recombination also occurs via Shockley-Read type recombination centers, situated 10-30 meV below the conduction band edge, enables the authors to calculate theoretical values of the lifetime in good agreement with the experimental results. Such a model can also be used to explain the variation of lifetime with composition. (23 refs.)

119628 A new static method for measuring minority carrier lifetime. J.-C.Manifacier, Y.Moreau, H.K.Henisch (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5158-60 (Sept. 1983).
Describes the theory of a new static lifetime measurement, carried out by means of potential probes in the vicinity of a current-carrying contact on a high-lifetime semiconductor, with and without traps. It is based on recognition of the fact that, in the presence of minority carrier injection, a uniform field is obtained only for a particular current density, and that depends directly on the carrier lifetime. (10 refs.)

119629 Dependence of the ambipolar diffusion in silicon on the carrier density. H.Bergner, V.Bruckner (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K85-8 (Sept. 1983).
Using the excite-and-probe technique it is possible to perform time-resolved reflectivity measurements on a picosecond time scale where recombination in undoped monocrystalline silicon is negligible. The authors have utilized this property to study experimentally for the first time the diffusion process of the carriers into the bulk in silicon at extremely high carrier densities. (5 refs.)

119630 Passivation of intragrain defects by copper diffusion in p-type polycrystalline silicon. M.Zehaf, G.Mathian, C.M.Singal, S.Martinuzzi (Lab. de Photoelectricite, Faculte des Sci. et Tech. de Marseille, Marseille, France).
Rev. Phys. Appl. (France), vol.18, no.9, p.557-60 (Sept. 1983).
In order to passivate structural defects which degrade electronic properties, copper is diffused in p-type Wacker polysilicon at low temperature (≤500°C). Copper diffused samples exhibit homogeneous values of effective minority carrier diffusion lengths, which are practically as high as the values measured in the starting material. Light beam induced current scannings indicate that the grain responses are improved after copper diffusion while the grain boundary recombination activity is enhanced. (10 refs.)

119631 Photoinduced absorption study of recombination in amorphous Si:H doped with P or B. D.Pfost, J.Tauc (Dept. of Phys., Brown Univ., Providence, RI, USA).
Solid State Commun. (USA), vol.48, no.2, p.195-8 (Oct. 1983).
The decay of the photoinduced midgap absorption band was studied in *a*-Si:H doped with P and B and compared with the decay in undoped *a*-Si:H and in *a*-Si:H with a high concentration of dangling bonds produced by electron irradiation. At high temperatures, recombination controlled by multiple trapping transport is observed in most samples. At low temperatures an additional recombination process is observed and attributed to tunneling which increases with doping. The temperature dependence of the decays correlates with dangling bond density produced by doping or irradiation. (15 refs.)

72.20M Galvanomagnetic and other magnetotransport effects

119632 Transverse magnetoresistance and Hall effect in wide-gap, p-type $Hg_{1-x}Mn_xTe$. J.R.Anderson, W.B.Johnson (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA), D.R.Stone.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1761-4 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
A low frequency AC measuring-current technique has been used to investigate the magnetoresistance and Hall effect in $Hg_{1-x}Mn_xTe$ over a temperature range from 2 to 300K. The exchange interaction between the Mn^{++} ions and the band carriers causes the energy bands to be significantly modified in the presence of a magnetic field. As a result magnetic boil-off and magnetic-field-enhanced hopping have been observed in *p*-type semiconducting samples. These effects produce a large decrease of resistance with increasing magnetic field at low temperatures. (13 refs.)

119633 Heating and mutual drag of charge carriers and phonons in nondegenerate Kane semiconductors in strong electric and quantizing magnetic fields. T.M.Gasymov, F.K.Kocharli.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.72-8 (1983). In Russian.
The influence of the mutual drag of heated carriers and phonons on galvanomagnetic effects in the nondegenerate semiconductors having a Kane spectrum of electrons being in strong electric E and quantizing magnetic H fields is considered. It is found that far from the acoustic instability the current density increases with E and approaching the acoustical instability point $j \sim E^2$. At the nearest vicinity of the acoustic instability point the curent reaches saturation. (10 refs.)

119634 Temperature dependence of $Bi_{0.92}Sb_{0.08}$ alloy galvanomagnetic coefficients in a weak magnetic field within the region from 77 to 300K. A.A.Musaev, B.A.Tairov, M.G.Shakhtakhtinskii.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.79-83 (1983). In Russian.
Temperature dependencies of the concentration and mobilities of the electrons and holes within the range from 77 to 300K are given on the basis of the measured galvanomagnetic coefficients for a $Bi_{0.92}Sb_{0.08}$ alloy. An essential decrease in the mobility of the electrons with temperature is assumed to be due to intervalley scattering by optical phonon. (8 refs.)

119635 Defect chemistry and intrinsic carrier concentration for $Hg_{1-x}Cd_xTe(s)$ for x=0.20, 0.40, and 1.0. Ching-Hua Su, Pok-Kai Liao, R.F.Brebrick (Coll. of Engng., Marquette Univ., Milwaukee, WI, USA).
J. Electron. Mater. (USA), vol.12, no.5, p.771-826 (Sept. 1983).
The theoretical equations governing the crystal-vapor equilibrium for $Hg_{1-x}Cd_xTe(s)$ are summarized for a model with double-ionized native defects and applied to the data for x=0.20, 0.40, and 1. The basic equations are shown to contain those used elsewhere as special cases. Low temperature Hall mobility data are analysed. Allowing the intrinsic carrier concentration, n_i, to vary, but under constraints, to obtain an optimum fit and assuming a non-degenerate semiconductor, the hole concentration-mercury pressure isotherms can be fitted satisfactorily and better than before. (36 refs.)

119636 Corbino resistance of iodine doped polyacetylene. W.Ross, A.Philipp, K.Seeger (L. Boltzmann Inst. fur Festkorperphys., Wien, Austria).
J. Phys. Colloq. (France), vol.44, no.C-3, p.127-30 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Both the Corbino resistance and the magnetoresistance of compacted and uncompacted iodine-doped polyacetylene $(CHI_y)_x$ were measured at different dopant levels in the range $0.13 \leq y \leq 0.3$ at temperatures between 4.2K and 40K. A comparison of the two phenomena for the case of positive Corbino- and magnetoresistance yields a mobility of the carriers which at 4.2K is on the order of 10^2 cm^2 V^{-1} sec^{-1}. The negative part of the magnetoresistance in uncompacted samples with $y \geq 0.2$ is tentatively explained by spin-splitting in a two-band model. (6 refs.)

119637 Quantization of the Hall conductance in a two-dimensional electron gas. G.F.Giuliani, J.J.Quinn, S.C.Ying (Dept. of Phys., Brown Univ., Providence, RI, USA).
Phys. Rev. B (USA), vol.28, no.6, p.2969-78 (15 Sept. 1983).
The authors present a microscopic theory of the Hall conductance in a two-dimensional electron gas. Their approach is based on a single-particle picture and explicitly accounts for the effects of a random impurity potential. Within the geometry introduced by Laughlin a general expression is derived from which it is possible to evaluate the Hall conductance in terms of the properties of the electronic spectrum at the Fermic energy for any value of the magnetic field. When the chemical potential lies between the bulk extended states of well-defined neighboring Landau bands, the Hall conductance is quantized in integral multiples of e^2/h, even in the presence of a large density of localized states. Within their model the exactness of this quantization depends on the shape of the confining potential, the thickness of the sample, and the magnetic field. (26 refs.)

119638 Hall-coefficient factor and inverse valence-band parameters of holes in natural diamond. L.Reggiani (Istituto di Fisica, Univ. di Modena, Modena, Italy), D.Waechter, S.Zukotynski.
Phys. Rev. B (USA), vol.28, no.6, p.3550-5 (15 Sept. 1983).
In strict analogy with the case of silicon, the Hall-coefficient factor of holes in natural diamond is found to be systematically less than unity in the range of temperature $100 < T < 1000K$ investigated here. A microscopic interpretation is shown to provide information on the reliability of a different set of inverse valence-band parameters which can be found currently in the literature. Agreement between theory and experiment confirms the values $|A|=3.61$, $|B|=0.18$, and $|C|=3.76$ deduced from pseudopotential band-structure calculations. (23 refs.)

119639 Hall effect in α-$RuCl_3$. S.Rojas, G.Spinolo (Dipartimento de Fisica, Univ. di Milano, Milano, Italy).
Solid State Commun. (USA), vol.48, no.4, p.349-51 (Oct. 1983).
The Hall effect measurements performed in the layer compounds α-$RuCl_3$ show that, in the sheets perpendicular to the c-axis, $\mu(300K) \simeq 0.2$ cm^2V sec^{-1}; the temperature dependence of μ appears to be $\mu(T)=\mu_0 T^{-n}$, with $n=2.3 \pm 0.1$, in the 180-320K range. The transport appears to be due to electrons that move with a band type of mechanism, the main scattering process being due to the homopolar high energy phonons which modulate the thickness of the layers. 72.20P Thermoelectric effects

119640 Measurement and interpretation of thermopower in oxides. A.Trestman-Matts, S.E.Dorris, T.O.Mason (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.589-92 (Aug. 1983).
The influence of point-defect gradients on thermoelectric coefficient measurements in oxides is quantified. This permits corrections to be made for data collected by conventional means and suggests alternative techniques of thermopower measurements which maintain the average sample temperature while imposing thermal gradients. Experimental results on CoO, Fe_3O_4, and FeO in equilibrium with various atmospheres are considered. (12 refs.)

72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

119641 Electrodynamical domains in metal plates. V.T.Dolgopolov, P.N.Chuprov (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
Solid State Commun. (USA), vol.48, no.2, p.165-7 (Oct. 1983).
It is experimentally revealed that part of the DC current appearing due to the rectification of the RF current in the skin-layer may close through the bulk of the specimen. As a result, the specimen is broken up into electrodynamic domains differing in the value of the macroscopic magnetic moment. (5 refs.)

119642 Generation, investigation and application of laser-induced charge carrier plasmas in semiconductors. H.Bergner, V.Bruckner, B.Schroder (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.113-24 (1983). In English.
By means of modelocked solid state lasers it is possible to generate high free charge carrier densities ($\sim 10^{20}$ cm^{-3}) in semiconductors. It leads to changes of both the optical and the electrical properties of the semiconductor sample. Using time resolved reflectivity measurements the lifetime of optically generated charge carriers was determined in the ps time scale. Experimental results for monocrystalline, polycrystalline and amorphous silicon and for GaAs are presented using a ps-Nd:YAG laser. Theoretical and experimental results on the time behaviour of charge carrier are demonstrated taking into

account the influence of the exciting pulse duration. Optoelectronic switches were also investigated using the second harmonic radiation of a Nd:YAG laser to switch a semiconductor shutter. Electrical pulses with peak voltages of 250 V and with rise times of subnanoseconds were generated. (20 refs.)

72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

119643 Investigation of persistent photoconductivity in Si-doped *n*-$Al_xGa_{1-x}As$ grown by molecular beam epitaxy. H.Kunzel, A.Fischer, J.Knecht, K.Ploog (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Appl. Phys. A (Germany), vol.A32, no.2, p.69-78 (Oct. 1983).
The persistent photoconductivity effect in Si-doped *n*-$Al_xGa_{1-x}As$ layers grown by molecular beam epitaxy on (100)GaAs substrates has been investigated by detailed Hall-effect and capacitance measurements at 10-300K. In the alloy composition range $0.25<x<0.40$ the electrical properties of *n*-$Al_xGa_{1-x}As$ are governed by a deep electron trap having an emission barrier of 0.34-0.40 eV (depending on the doping concentration), as determined by admittance measurements. The concentration of deep electron traps, deduced from low-temperature capacitance measurements, is found to coincide with the amount of persistent photoconductivity observed in the material. (27 refs.)

119644 Effect of applied bias voltage on photocurrent of Si photocell. T.Ugumori (Tech. Coll., Yamaguchi Univ., Ube, Yamaguchi, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1223 (July 1983).
The effect of an applied bias voltage on the photocurrent from an Si photocell has been examined to confirm the band bending mechanism. A conventional Sharp SPD-110 Si photocell was employed as a specimen. (3 refs.)

119645 Surface and interface recombination in thin film HgCdTe photoconductors. R.D.Graft, F.F.Carlson, J.H.Dinan, P.R.Boyd, R.E.Longshore (US Army Night Vision, Electro-Optics Lab., Fort Belvoir, VA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1696-700 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
A method is described for the separation of bulk and surface recombination parameters using experimentally measured photoconductive decay curves. Curve fitting procedures using numerical solutions to the time dependent hole continuity equation permit a unique determination of surface recombination velocities and bulk lifetime. The method is applied to thick and thin films of HgCdTe to determine recombination velocities at several technologically important interfaces. Values of recombination velocity ranged from 300 to 20000 cm/s depending upon material growth method and surface preparation. Experimentally observed deviations from the assumed model are discussed in terms of a spatially dependent bulk lifetime. (12 refs.)

119646 Phototransients in anodic tantalum oxide thin films. W.H.Bokhari, F.M.Nazar (Centre for Solid State Phys., Punjab Univ., Lahore, Pakistan).
Int. J. Electron. (GB), vol.55, no.4, p.647-51 (Oct. 1983).
Phototransients under radiation of 274 nm have been studied in anodic tantalum oxide thin films. The area under the phototransient curves, the relaxation time and the decay time are found to decrease with the applied field. For short times $\Delta I\alpha$ exp $(-t/\tau)$ with τ decreasing with field, while for longer times there is a departure from exponential behaviour. These phototransients may be due to the drift of photoexcited electrons under the action of an applied field and their subsequent retrapping. (14 refs.)

119647 Study of space charge effects on photoconduction in amorphous $Se_{0.95}Te_{0.05}$ films using a three electrode system. M.Noda (Technol. Dept., Aichi Univ. of Education, Aichi, Japan), K.C.Kao, L.Chow.
Int. J. Electron. (GB), vol.55, no.4, p.661-7 (Oct. 1983).
An experimental study of space charge effects on photoconduction in amorphous $Se_{0.95}Te_{0.05}$ films has been made using a three electrode system. The results indicate that the photoconduction in this material is dominated by holes and is governed by the built-in field created by space charges and the carrier injection from the electrical contacts, and that the three electrode system can be used for the investigation of the behaviour of space charges. (3 refs.)

119648 Photoionization cross section of electron irradiation induced levels in silicon. S.D.Brotherton, G.J.Parker, A.Gill (Philips Res. Labs., Redhill, England).
J. Appl. Phys. (USA), vol.54, no.9, p.5112-16 (Sept. 1983).
Transient photocapacitance measurements have been made on 12-MeV electron irradiated silicon diodes. Both *p*- and *n*-type substrates were used in order to investigate the centers in both halves of the band gap. Photoionization cross sections were measured on two divacancy levels at $E_v+0.20$ eV and $E_c-0.23$ eV, the A center ($E_c-0.17$ eV), and further levels at $E_c-0.09$ eV and $E_v+0.35$ eV. The only center likely to be a useful counterdopant for a 3-5 μm extrinsic silicon imaging device is the divacancy at $E_v+0.20$ eV. (21 refs.)

119649 Photoeffects in cadmium sulfide and sulfoselenide powders: a reexamination by microwave photoconductivity. D.H.Klosterboer, W.L.Meissner, M.R.V.Sahyun (Sci. Res. Lab., 3M Co., St. Paul, MN, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5161-70 (Sept. 1983).
Cu doped CdS powders in electrophotographic devices have been characterized using the flash microwave photoconductivity method. The signals representative of these materials exhibited minima, as well as maxima, in microwave absorption, hence conductivity; the former were identified with the slow thermalization of deep trapped electrons, which allowed the trapping characteristics of the samples to be inferred. Correlation of the microwave photoconductivity results with electrophotographic measurement elucidated the role of the trapping states in interfering with electrophotographic response. From temperature and wavelength dependence of the photoconductivity it was inferred that (except at low temperatures) the conduction band is not populated directly on light absorption, even of band-gap wavelengths. A kinetic analysis revealed that the observed decay of the photoconductivity was controlled by hole trapping at the Cu(I) centers in the powder; thus the experimental data could be used to reveal a two-stage mechanism for hole trapping, and some features of the potential surface associated therewith are inferred. (32 refs.)

119650 Charge carrier photogeneration in iodoform. Applicability of the Onsager model. S.Nespurek (Inst. of Macromolecular Chem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), A.Samoc, M.Samoc, J.Sworakowski.
J. Chem. Phys. (USA), vol.79, no.6, p.3104-12 (15 Sept. 1983).
The photogeneration of electrons and holes in thin layers of iodoform has been investigated as a function of the electric field by the method of photoinduced discharge current. The experimental results can be described by the Onsager theory. The fraction of absorbed photons which produce thermalized electron-hole pairs is close to unity. The pair separation distance is ~3 nm. Equal values of the primary rates of production of electrons and holes support the idea of an intrinsic photogeneration mechanism. (32 refs.)

119651 Spectroscopic analysis of transient photocurrents in a-As_2Se_3. H.Michiel, G.J.Adriaenssens, J.M.Marshall (Lab. voor Vaste Stof en Hoge Drukfysika, Katholeke Univ., Leuven, Leuven, Belgium).
J. Phys. C (GB), vol.16, no.28, p.L1005-10 (10 Oct. 1983).
A recently developed spectroscopic method, based on trap-controlled band-transport (TCBT) in semiconductors, is applied to the transient photocurrent in glassy As_2Se_3. The analysis points to the presence of a local maximum in the density of localised states at some 0.45 eV inside the gap; beyond this maximum, the density decreases exponentially over a range of ~0.15 eV. Difficulties concerning the spectroscopic interpretation of transport data are further examined. (18 refs.)

119652 Anomalous photovoltaic effect in thin films of ZnSe obliquely deposited in vacuum. A.A.El-Shazly (Faculty of Education, Ain Shams Univ., Cairo, Egypt), M.A.Kenawy, H.T.El-Shair, M.M.El-Nahass, H.S.Soliman.
J. Phys. D (GB), vol.16, no.10, p.1967-76 (14 Oct. 1983).
An anomalous photovoltaic effect (APE) has been observed in thin films of zinc selenide obliquely deposited in vacuum for the first time. Photovoltages of up to 70 V have been measured in some samples. The effect is influenced strongly by some experimental parameters. The changes in the photovoltages may be attributed to the film structure which has been investigated during the course of this study. (6 refs.)

119653 Photocondutivity of polyacetylene. G.Guillaud, M.Maitrot (Univ. Claude Bernard, Lyon, France), J.Davenas, X.L.Xu, B.Francois, C.Mathis, J.J.Andre.
J. Phys. Colloq. (France), vol.44, no.C-3, p.101-5 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors present a study of the photoconductivity of polyacetylene samples versus the cis-trans ratio. The transitory effect appears for a weak trans percentage. The traps play an increasing part when the isomerization is larger. (7 refs.)

119654 Photogeneration of solitons in trans-$(CH)_x$: the reversed spin-charge relation of the photoexcitations. J.D.Flood, A.J.Heeger (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.397-401 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
High sensitivity ESR studies of trans-$(CH)_x$ have been carried out during photoexcitation with $h\omega>E_g$. The results set an upper limit on the number of photoinduced spins and on the quantum efficiency for photoproduction of unpaired spins. The authors conclude that the charged photoexcitations are spinless and therefore have the reversed spin-charge relation of solitons. The photogeneration branching ratio, charged solitons to neutral solitons, is greater than 10^2. (21 refs.)

119655 Photoproduction of neutral versus charged solitons in trans $(CH)_x$. R.Ball, W.P.Su, J.R.Schrieffer (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.429-35 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The branching ratio R for the photoproduction of neutral soliton-antisoliton pairs ($S^0\bar{S}^0$) versus charged pairs ($S^{\pm}\bar{S}^{\mp}$) is calculated for pristine trans-polyacetylene. Within the SSH model, the authors find R vanishes in the adiabatic approximation as a consequence of inversion symmetry (parity) and the Pauli principle. If one includes nonadiabatic effects, R remains zero at least to second order in the electron-phonon interaction as a consequence of charge conjugation symmetry. Thus, neutral $S\bar{S}$ photoproduction is strongly suppressed in $(CH)_x$, in agreement with experiments by Flood, et al. (3 refs.)

119656 Photogeneration and geminate recombination of charge carriers in a quasi-one-dimensional system. A.S.Siddiqui (Dept. of Phys., Univ. of Essex, Colchester, England).
J. Phys. Colloq. (France), vol.44, no.C-3, p.495-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
In a quasi-one-dimensional system the photogeneration rate for excess free carriers is expected to be dependent on the applied electric field. This leads to a number of novel features in the photoconductive behaviour of a 1-D material, particularly in the presence of deep trapping centres. The author describes the expected photoconductive response of such a system in detail as a function of light intensity, polarisation, applied electric field and the direction of current flow. These expectations, valid for all 1-D systems, are then compared with the experimental data presented for the quasi 1-D single crystal polymer polydiacetylene-toluene sulphonate. The experimental results indicate that, for the 1-D case, the quantum efficiency for free carrier generation has a minimum non-zero value in the low field limit which may be comparable with that in the 3-D case. This necessitates a modification, in the low field limit, of the presently accepted 1-D version of the Onsager theory of geminate recombination. (2 refs.)

119657 Photoconductivity in oriented polymers and liquid crystalline model compounds containing carbazole. L.L.Chapoy, D.K.Munck (Inst. for Kemiindustri, Tech. Univ. of Denmark, Lyngby, Denmark).
J. Phys. Colloq. (France), vol.44, no.C-3, p.697-700 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Interest in photoconductive polymers has been mainly related to poly(N-vinylcarbazole), PVK, and in particular to carbazole, the active light sensitive chromophore in PVK. Inherent, structural defects in PVK, i.e. conformational distributions, imperfect tacticity and finite chain lengths are thought to inter-

fere with the charge carrier mobility. Novel systems, amenable to the investigation of the influence of ordered arrays of carbazole chromophores on the photoconductivity are presented. Preliminary results for the photoconductivity of carbazole doped nematic liquid crystals are given. (16 refs.)

119658 Photovoltaic effects in liquid crystal cells containing organic dyes. S.Sato, S.Fukuda (Dept. of Electronic Engng., Mining Coll., Akita Univ., Akita, Japan).

Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.99-108 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).

Dye sensitization on photovoltaic phenomena under visible light stimulation are described in smectic, nematic, and isotropic phases of p-cyano-p′-n-octylbiphenyl cells with a symmetrical electrode arrangement. Methyl red is used as a sensitizer. The dependence of short-circuit photocurrents on excitation light intensity, light pulse width, temperature, and the cell thickness are measured. The photocurrent consists of three components, that is, the small negative peak with a fast response, the second positive peak following after the first peak, and the third negative peak with a slow response. The second and the third components of the photocurrents cannot be observed in the solid crystalline state. Both of them decrease with an increase in the cell thickness, and their response time becomes shorter as the temperature rises. These two components are induced by the diffusion processes of the carriers produced by the light stimulation. (4 refs.)

119659 Effect of illumination on current-voltage characteristics of $GdIn_3S_6$ single crystals. G.M.Guseinov, G.M.Niftiev, M.G.Shakhtakhtinskii (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).

Phys. Status Solidi a (Germany), vol.79, no.1, p.K53-5 (Sept. 1983).

Presents an investigation of the current voltage characteristics (CVC) of $GdIn_3S_6$ compounds in three states (dark states, residual-conductivity (RC) state, i.e. dark state after preliminary bias lighting, and illuminated state). It was noted that under the effect of an electric field of strength 4.4×10^3 V/cm the specimen passes from a more photoconductive to a less photoconductive state, i.e. an N-like CVC is observed, and as this takes place, one can see a growth of the currents corresponding to the points of transition from the high-conductivity to the low-conductivity state. (6 refs.)

119660 Photovoltaic behaviour of rhodamine 6G Schottky-type cells. J.Muto, Y.Tsunekawa (Instrumentation Engng., Faculty of Engng., Keio Univ., Yokohama, Japan).

Phys. Status Solidi a (Germany), vol.79, no.1, p.K109-12 (Sept. 1983).

Rhodamine 6G (Rh6G) is an organic dyestuff, belonging to the xanthene family and is widely used as a laser dye material. The authors have fabricated Rh6G thin film sandwich cells and examined their photovoltaic properties. Rh6G was evaporated in vacuum from a Ta crucible on a transparent conducting coating (SnO_2) glass. A film of Al was subsequently evaporated on top of the organic solid. Photovoltaic behaviours of the cells were examined in vacuum of 10^{-2} Torr and the irradiation of light was done through the glass electrode of the cell. (6 refs.)

119661 Photoconductivity and the evolution of energy bands in fluid xenon. R.Reininger, U.Asaf, I.T.Steinberger (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel), V.Saile, P.Laporte.

Phys. Rev. B (USA), vol.28, no.6, p.3193-9 (15 Sept. 1983).

Photoconductivity excitation spectra for densities above 10^{21} atoms/cm^3 up to the triple point exhibit a threshold that moves to lower photon energies with increasing density. Its value extrapolated to zero density is 11.10 eV, i.e. the difference between the energy minimum of the $Xe_2{}^+$ molecular ion and the ground-state energy of the xenon atom. The hole polarization energy P^+ was evaluated using the Born charging energy for the same density range. These results along with the previously determined values of the electron affinity V_0 yielded a full representation of the energy-band edges for the whole density range. The relationship between these results and those on the evolution of excitons is discussed in detail. (23 refs.)

119662 Wide optical gap, undoped, photoconductive a-Si_xN_{1-x}:H prepared by DC sputtering. R.Meaudre, J.Tardy (Dept. de Phys. des Materiaux, Univ. Claude Bernard de Lyon, Villeurbanne, France).

Solid State Commun. (USA), vol.48, no.2, p.117-19 (Oct. 1983).

The effect of nitrogen in hydrogenated amorphous silicon (a-Si:H) has been investigated on thin films produced by DC sputtering in a $Ar+N_2+H_2$ gas mixture. The optical bandgap is seen to increase linearly from 1.85 eV to 2.3 eV as the $P(N_2)/P_{total}$ ratio increases from 0 to 0.013. AM-1 photoconductivity is better than that of undoped a-Si_xC_{1-x}:H films and is very close to that of these B doped films though no doping effect is observed. The normalized photoconductivity $\eta\mu\tau$ corresponding to a 10^4 cm^{-1} optical absorption coefficient compares favourably with that of undoped a-Si_xC_{1-x}:H films. (13 refs.)

119663 Spectral dependences of the photoconductivity of thin cadmium-doped Dy_2S_3 and Yb_2S_3 films. L.N.Glurdzhidze, D.G.Gzirishvili, Z.U.Dzhabua, T.O.Dadiani, V.V.Sanadze (V.I. Lenin Polytech. Inst., Tbilisi, Georgian SSR).

Sov. Phys.-Solid State (USA), vol.25, no.3, p.539-40 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.935-6 (March 1983). [received: Oct. 1983]

The authors report the results of a determination of the spectral dependences of the photoconductivity of cadmium-doped thin films of dysprosium and ytterbium sesquisulfides. Measurements of the photoconductivity were made by a method described by Glurdzhidze et al. (1980, 1981) at photon energies of 0.2-3.3 eV and temperatures 115-500K. The numerical values of the photoconductivity were calculated by dividing by the same number of photons corresponding to the 0.1 W/cm^2 intensity of the radiation incident on a film. (11 refs.)

119664 Measurement of the decay time constant of photoconductors. D.Langbein.

Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.133-43 (1983). In German.

It is suggested that the decay curves of square wave light excited semiconductors can give information on recombination processes. The decay was found from the change of Q-factor of a microwave resonator loaded with the photo-conductor. The theory of Q-factor dependence of a low-loss cavity on internal loading is developed and methods of using reflection coefficient to find loading are stated. A measuring arrangement is illustrated, which was used in the 30 MHz region. Optical excitation was by infrared square waves from a pair of type LD271 light emitting diodes. It is noted that the resonator method should make it possible to measure semiconductor carrier lifetime by a non-contact method. (13 refs.) *G.M.E.*

72.50 ACOUSTOELECTRIC EFFECTS

119665 Nonlinear theory of propagation of sound of intermediate frequency. V.D.Kagan (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.3, p.375-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.658-61 (March 1983). [received: Oct. 1983]

When an acoustic wave of intermediate frequency interacts with electrons, the component of the electron distribution function averaged over a constant-energy surface does not reach equilibrium during the period of the acoustic wave. As a result, the acoustic wave interacts with electrons described by such a nonequilibrium distribution function rather than with the average electron density. Since acoustic waves influence strongly electrons with low energies, the nonlinearity parameter exceeds the density nonlinearity parameter. (7 refs.)

119666 Theory of anomalous acoustical skin effect in metals. G.I.Ivanovski (Inst. for Phys. Problems, Acad. of Sci., USSR), M.I.Kaganov.

Sov. Phys.-JETP (USA), vol.56, no.6, p.1345-9 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2320-8 (Dec. 1982). [received: Oct. 1983]

The distribution of the displacement field u(z) in a metallic halfspace $z>0$ is calculated for the case in which a transverse sound wave of frequency ω is excited at the boundary; the frequency satisfies the condition $\omega\tau\gg1$, where τ is the conduction electron mean free path time. It is shown that the electrons whose velocity is parallel to the wave vector 'drag' the displacement wave over a distance $z\sim l=v_F\tau$ (v_F is the Fermi velocity). In the collisionless limit $(l\rightarrow\infty)$ the sound wave decays nonexponentially. (15 refs.)

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

119667 Electrical switching in silver chloride. A.Friedenberg, Y.Shapira (School of Engng., Tel Aviv Univ., Ramat Aviv, Israel).

J. Appl. Phys. (USA), vol.54, no.9, p.5171-5 (Sept. 1983).

Observation of threshold switching is reported in AgCl. Subsequent to a forming process, switches are developed from AgCl samples of various crystalline structures. The switching dynamics as well as the relevant electrical properties are characterized. During the forming process Ag dendrites are believed to form by an electrolytic process. The principal ON state current channel bridges the dendrites via a thermal or an electronic mechanism. (13 refs.)

119668 Analysis of mixed conduction effects in semi-insulating gallium arsenide. J.J.Winter, H.A.Leupold, R.L.Ross, A.Ballato (US Army Electronics Technol. & Devices Lab., Fort Monmouth, NJ, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5176-82 (Sept. 1983).

Hall effect and conductivity measurements made on semi-insulating bulk GaAs are examined by a new approach to mixed conduction analysis. Based on Fermi level and electron mobility analyses of conductivity and Hall coefficient, it uses revised values of effective densities of states at the band edges and electron/hole mobility ratios recently adopted by other workers. The treatment provides a visual analysis of the system in terms of the electrical parameters and impurity densities, and establishes criteria for the onset of mixed conduction. (19 refs.)

119669 Mixed electrical conduction in sintered BCC $6Bi_2O_3.SiO_2$. M.Miyayama, Y.Suenaga, H.Yanagida (Dept. of Industrial Chem., Univ. of Tokyo, Tokyo, Japan).

J. Mater. Sci. (GB), vol.18, no.10, p.3023-30 (Oct. 1983).

The electrical behaviour of BCC $6Bi_2O_3.SiO_2$ sintered specimens was investigated by measuring electrical conductivity, ionic transference number, Seebeck coefficient and cationic composition. The total conductivity, σ_t, in the P_{02} range from 10^5 to 10^{-7} Pa showed mixed conduction where electron conductivity was predominant below 10^{-1} Pa and where σ_t could be expressed by the equation $\sigma_t=\sigma_i+\sigma_p{}^0.(Po_2/10^5\ \mathrm{Pa})^{1/4}+\sigma_n{}^0.(Po_2/10^5\ \mathrm{Pa})^{-1/4}$ where σ_i, $\sigma_p{}^0$ and $\sigma_n{}^0$ represent the oxygen ionic, hole and electron conductivities, respectively, at a Po_2 of 10^5 Pa. The silicon concentration in the specimen was slightly less than the theoretical value. The cation atomic ratio, Si/Bi (theoretically 1/12), was estimated as 0.93~0.95/12. Schottky-type defects of silcon and oxygen vacancies were proposed to explain a much higher oxygen ionic conductivity in the sintered specimens than that reported for single crystals. (19 refs.)

119670 Electrical conduction in β-Bi_2O_3 doped with Sb_2O_3. M.Miyayama, S.Katsuta, Y.Suenaga, H.Yanagida (Dept. of Industrial Chem., Univ. of Tokyo, Tokyo, Japan).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.585-8 (Aug. 1983).
Electrical conduction in tetragonal β-Bi_2O_3 doped with Sb_2O_3 was investigated by measuring electrical conductivity, ionic transference number, and Seebeck coefficient. The β-Bi_2O_3 doped with 1 to 10 mol.% Sb_2O_3 was stable up to 600°C and showed an oxygen ionic and electronic mixed conduction, where the electron conduction was predominant at low oxygen pressures. The oxygen-ion conductivity showed a maximum at 4 mol.% Sb_2O_3, whereas the activation energy for the ionic conduction remained unchanged for 4 to 10 mol.% Sb_2O_3-doped specimens. These results were interpreted in terms of the oxygen vacancy concentration and the distortion of the tetragonal structure. The electron conductivity and its oxygen pressure dependence decreased with increasing Sb_2O_3 content. The fact that Sb^{5+} is partially reduced by excess electrons in heavily doped β specimens at low oxygen pressures is explained. (21 refs.)

119671 Semiconductor to metal transition in $MoCl_5$ doped polyacetylene. M.Galtier, J.M.Gay, A.Montaner, J.L.Ribet (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.107-10 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Conductivity, thermopower, infrared transmission measurements, performed on cis-CH_x doped with $MoCl_5$, exhibit clearly a semiconducting behaviour of concentration doping $Y<0.5\%$ and a metallic one for $Y>5\%$ but no sharp transition between them. (3 refs.)

119672 TCNQ simple salts of diquaternised 4,4′-bipyridyl. G.J.Ashwell (Dept. of Chem., Sheffield City Polytech., Sheffield, England), J.G.Allen.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1261-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The properties of 21 simple TCNQ salts of diquaternised 4,4′-bipyridyl are reported. The conductivities range from metallic to insulating with $\sigma(\mathrm{rt})=30$ to 10^{-10} S cm^{-1}. No correlation between the cation half-wave reduction potential and the electrical conductivity has been found. (10 refs.)

119673 On the electrical switching properties of polymeric liquid crystals. H.Pranoto, W.Haase (Inst. Physikalische Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.299-308 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The properties of side chain polymeric liquid crystals in an electric field are described. The polymers investigated are (A) a polysiloxan-copolymer with Cl- and OCH_3-end groups in the mesogenic side chains and (B) a polyacrylic ester homopolymer with a CN-group in the mesogenic side chain. Applying the Freedericksz-effect, the rise times and the passive decay times are determined. With the two-frequency technique, the active decay time is also obtained. The order of magnitude for the active decay time is about one second. The active decay time is approximately constant in a temperature region about 15K below the clearing point. (12 refs.)

119674 Origin of the low electronic component of the electrical conductivity of solid electrolytes based on β-Al_2O_3. B.Ya.Moizhes (All-Union Sci.-Res. Design-Construction Technol. Inst. of Current Sources, Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.532-3 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.924-6 (March 1983). [received: Oct. 1983]
The electronic component of the electrical conductivity of all the β-Al_2O_3 compositions is very low compared with the ionic component. Since the expected mobility of electrons (holes) is 1 $cm^2.V^{-1}.sec^{-1}$, i.e. it is 4-5 orders of magnitude higher than the measured mobility of the Na^+ ions, it follows that either the number of electrically active impurities is very low (10^{-6}-10^{-7} compared with the concentration of Na^+) or the impurity levels are very deep. The author considers both of these possibilities. (8 refs.)

72.70 NOISE PROCESSES AND PHENOMENA

119675 Noise in highly correlated commensurate charge transfer salts. H.Rommelmann (Xerox Webster Res, Center, Webster, NY, USA), J.W.Kaufer, A.J.Epstein, J.S.Miller.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1441-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present the results of a study of the frequency (f) dependent noise power for commensurate charge transfer salts with strong Coulomb repulsion. f^{-1} noise is observed with increasing currents. Excess f^{-1} noise is measured for samples which were chemically doped to form solitons. Frequency independent shot noise is not observed. (10 refs.)

119676 Nonlinear AC dynamics and conduction noise in $NbSe_3$. N.P.Ong (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1659-63 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The phase-space plots (I vs. V) of $NbSe_3$ are obtained for driving frequencies ≈ 1 MHz. The strong hysteresis observed disagrees with the classical model. In a separate experiment on the noise spectrum shows the author that the CDW noise arises from the contact boundaries rather than from the bulk, and is unrelated to impurities or the pinning potential. (11 refs.)

119677 Theory of the narrow band noise spectrum and metastable conductivity due to sliding charge density waves. J.B.Sokoloff, B.Horovitz (Northeastern Univ., Boston, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1667-71 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present molecular dynamical calculations on a model for sliding charge density waves interacting with impurities. Metastable electrical conduction is found as well as noise spectrum, which is studied as a function of system size. (9 refs.)

119678 The relaxation oscillator model for the narrow band noise in $NbSe_3$. M.Weger (Hebrew Univ., Jerusalem, Israel), W.G.Clark, G.Gruner.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1673-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The relaxation oscillator model for the narrow band noise in $NbSe_3$ is described. The frequency dependence of the signal and harmonics is found to confirm to this model. (10 refs.)

73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

119679 A study of valence band shake-up features of CO on Pt{100} using synchrotron radiation. D.E.Grider, K.G.Purcell, N.V.Richardson (Donnan Labs., Univ. of Liverpool, Liverpool, England).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.320-4 (16 Sept. 1983).
A study of the shake-up features in the valence region of CO on Pt{100} is presented. The onset of these features is shown to be correlated with the excitation threshold for the Pt(4f) levels. A possible mechanism for the shake-up process is proposed in which the Pt(4f) hole results in excited states other than a single electron-hole state. Subsequently, the Pt(4f) hole decays via a direct recombination process resulting in the observed satellite features. The implications of such a shake-up process for photon-stimulated desorption (PSD) are also discussed. (18 refs.)

119680 Effects of vacuum annealing on the electronic properties of cleaved GaAs. F.Proix, A.Akremi, Z.T.Zhong (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
J. Phys. C (GB), vol.16, no.28, p.5449-63 (10 Oct. 1983).
Low-energy electron diffraction, Auger electron spectroscopy and photoemission yield spectroscopy measurements have been performed on GaAs samples cleaved in ultra-high vacuum and subject to in situ isochronous anneals up to 850°C. The properties of the cleaved (110) surface remain unchanged up to about 350°C. Around this temperature, a dissociation occurs inducing a local reconstruction of the surface; at the same time, new states appear which may be attributed to Ga vacancies. Then, around 580°C, the well known dissociation of GaAs sets in with formation of As_2, and the Ga-Ga bonds which then form, determine the electronic properties of the sample. Evaporation of arsenic would become dominant around 650°C. Beyond about 780°C, the excess Ga coalesces into Ga-metal droplets and the GaAs substrate undergoes faceting. (33 refs.)

119681 Surface photovoltage spectroscopy and thermally stimulated contact potential difference studies of real ZnS surfaces. M.S.El-Dessouki, V.A.Attia (Dept. of Phys., Cairo Univ., Giza, Egypt).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.939-42 (1983).
Surface photovoltage spectroscopy and thermally simulated contact potential difference measurements are reported for real ZnS surfaces. The measurements allow the determination of the surface states existing via two different processes, i.e. optical excitation of carriers into and from the existing surface states. Changing the surface condition by annealing at 350°C produces different electronic features which are attributed to different bondings at surface vacancy sites. Furthermore, annealing changes the polarity of the surface photovoltage. (34 refs.)

119682 Convergence study of the density-gradient expansion for the screened-Coulomb exchange energy. A.-R.E.Mohammed (Dept. of Phys., Brooklyn Coll. of the City Univ. of New York, New York, NY, USA), V.Sahni.
Phys. Rev. B (USA), vol.28, no.6, p.3014-21 (15 Sept. 1983).
In this work the authors have studied the convergence properties of the density-gradient expansion for the exchange energy for screened-Coulomb interaction as applied to surfaces. The expansion examined is that which is valid within the Hartree-Fock approximation, and the densities for which the convergence is tested are those derived from the step-potential model of a surface. Surprisingly, contrary to intuitive expectations for a short-range interaction, it is observed that both the gradient expansion as well as the local-density approximations are poor. Furthermore, the former approximation does not reduce the error of the latter to any significant degree even for the most slowly varying of the densities considered. The results of calculations for the gradient expansion for the bare-Coulomb exchange energy, together with consideration of various convergence conditions, indicate that this lack of convergence is principally due to the limitations of the step-potential model. The arguments and different conclusions arrived at in previous work on this expansion by others using the step-potential model are also examined, and suggestions for future work made. (42 refs.)

119683 Electronic structure of metal overlayers on rhodium. P.J.Feibelman (Sandia Nat. Labs., Albuquerque, NM, USA), D.R.Hamann.
Phys. Rev. B (USA), vol.28, no.6, p.3092-99 (15 Sept. 1983).
The authors have evaluated work functions, surface core-level shifts, and surface band dispersions for clean, Ag-covered, and Pd-covered Rh(100) surfaces, and for clean and Ag-covered Rh(111). The calculations were performed self-consistently, using the surface-linearized augmented-plane-wave method. As expected from the Pauling electronegativities, Ag adsorption lowers the work function from the clean Rh value, by several tenths of an eV, while Pd has an almost negligible effect. The values calculated for the core-level shifts of various films are shown to correspond to expectations based on surface band narrowing and layerwise charge neutrality. Using the core-level shifts, they predict heat-of-adsorption differences (for Ag on Pd vs. Ag on Rh, etc.) that are in quite good agreement with the empirical predictions of Miedema and Dorleijn. Finally, the chemical inactivity of the Ag-covered Rh surface is associated with the fact that, for that system, the outer-layer local density of states is essentially that of Ag, with a characteristically low value at the Fermi energy. On the other hand, the Pd-covered Rh surface is associated with the fact that, for that system, the outer-layer local density of states is essentially that of Ag, with a characteristically low value at the Fermi energy. On the other hand, the Pd-covered Rh surface should behave much like clean Rh with an extra electron per surface atom. The surface band dispersions for the Pd-covered and clean Rh surfaces are closely similar. This result contrasts sharply with the case of Pd-covered Nb, for which, because of the appreciable electronegativity difference, the Pd overlayer is effectively 'noble'. (28 refs.)

119684 Electronic structure of transition-metal—transition-metal interfaces: Pd on Nb(110). V.Kumar, K.H.Bennemann (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany).
Phys. Rev. B (USA), vol.28, no.6, p.3138-49 (15 Sept. 1983).
With the use of a self-consistent tight-binding scheme, local electronic densities of states (LDOS) are calculated for commensurate (*C*) Pd* (110) and incommensurate (*IC*) Pd (111) layers on Nb (110). At low coverages ($\Theta<1$) Pd induces a Pd-Nb resonance near the bottom of the Nb *d* band. In agreement with the experimental results this resonance shifts to lower binding energy as the coverage is increased. Comparing detailed features of the

LDOS with the photoemission data the authors predict a *C-IC* structural transformation for approximately one monolayer of Pd. This they also conclude from a simple interface energy calculation. The *d*-electron charge transfer across the interface and the LDOS of Pd at the Fermi energy (E_F) are small. The latter, however, increases with the Pd coverage. The LDOS of the top Pd layer is nearly the same for Pd (111) on Pd* (110)-Nb (110) or Pd (111)-Nb (110) interfaces and in all cases there is a significant decrease of Nb *d* states near the E_F. This shows that the LDOS is mainly perturbed at the interface. Implications of these results for hydrogen uptake and work-function changes are discussed. (52 refs.)

119685 Interaction of CO and N_2 with the Cu (111) surface. W.Eberhardt (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA), E.W.Plummer.
Phys. Rev. B (USA), vol.28, no.6, p.3605-7 (15 Sept. 1983).
The electronic structure of the Cu (111) surface changes upon adsorption of CO or N_2. Comparing the results for both adsorbates, the authors are able to differentiate between changes in the electronic structure induced by a change in the potential at the surface or by a chemical bond. The Λ_1 surface state is involved in the chemical bond of CO. On the other hand, a surface resonance at the top of the *d* bands and an absorbate-induced surface state at the bottom of the *d* bands are caused by changes in the potential. (12 refs.)

119686 Generalized topological transition; the surface phase transition of order $2^1/_2$. M.I.Kaganov, A.A.Nurmagambetov (Inst. of Phys. Problems, Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1331-3 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2296-300 (Dec. 1982). [received: Oct. 1983]
It is shown that a change in the local structure of the Fermi surface can lead to a singularity of the electronic part of the surface energy of a conductor. At zero temperature this singularity should be treated as a phase transition of order $2^1/_2$. (10 refs.)

73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

119687 Schottky barrier height of Au/p-$In_{1-x}Ga_xAs_yP_{1-y}$ with native oxide. M.Naitoh, S.Sakai, M.Umeno (Dept. of Engng. Sci., Nagoya Inst. of Technol., Nagoya, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1224 (July 1983).
The Schottky barrier height depends strongly on the surface treatment before vacuum evaporation. The current-voltage relations of Au/p-InGaAsP diodes obtained by etching in Br+CH_3OH and stopping with CH_3OH and etching in Br+CH_3OH and stopping with water, for about 1 min at room temperature, are shown. The Schottky barrier height of Au/p-InGaAsP diodes decreases linearly with increasing As composition *y*. This linear relationship implies that the Schottky barrier height of the semiconductor with native oxide, as well as that with the atomically clean surface obeys the common anion rule. (8 refs.)

119688 A study of Schottky contacts on indium phosphide. E.Hokelek, G.Y.Robinson (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5199-205 (Sept. 1983).
The Schottky-barrier energy ϕ_B for Al, Ni, Pd, Co, Au and Ag contacts on chemically etched ⟨100⟩ surfaces of both *p*- and *n*-type InP was measured and the metallurgical behavior of the contact structures was studied using Auger-electron spectroscopy. No simple linear relationship could be found between the measured Schottky barrier energies on InP and the work functions or the electronegativities of the contact metals. Therefore, the results could not be explained in terms of the traditional Schottky and Bardeen theories. However, a very well defined relationship was observed between the Schottky barrier energies and the heats of reaction per formula unit ΔH_r for the most stable metal phosphides that could be formed between the contact metals and the InP substrate. The contact metals Au and Ag whose phosphides are less stable than InP (i.e., $\Delta H_r > 0$) produced diffuse interfaces, characterized by extensive outdiffusion of In, and yielded low values of ϕ_{Bp}, the Schottky-barrier energy on *p*-type InP; whereas the contact metals Al and Ni which can form compounds with phosphorus that are significantly more stable than InP (i.e., $\Delta H_r < 0$) showed less In outdiffusion and produced higher values of ϕ_{Bp}. Two distinct Fermi-level pinning positions located at 0.50 ± 0.01 eV and 0.40 ± 0.02 eV below the conduction band minimum of InP were found and correlated to the metallurgical state of the contact structures. The findings of the present study strongly suggest that Schottky-barrier formation on InP is controlled by chemical reaction between the contact metal and the InP substrate with the degree of chemical reactivity appearing to determine the Fermi-level pinning position at the interface. 119689 Investigation of the electrostatic charging of dispersed thermoplastics in fluidized systems. V.A.Dovgyalo, O.R.Yurkevich (Inst. of the Mech. of Metal-Polymer Systems, Acad. of Sci., Gomel, Belorussian SSR).
Colloid J. USSR (USA), vol.44, no.6, p.913-16 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1034-8 (Nov.-Dec. 1982). [received: Sept. 1983]
The features of the charging of dispersed thermoplastic polymers and two-component composites based on them due to static electrification as a result of contact interactions in fluidized systems have been investigated. The influence of the technological conditions, the dielectric properties of the polymers, and the nature and content of modifiers on the charge of the static electricity and the distribution of the particles with respect to the sign of the charge upon fluidization has been demonstrated. (6 refs.)

119690 Linear flexible-chain polymer electrification conditions and pattern at $T > T_G$. V.E.Dreval, V.P.Protasov, G.V.Vinogradov (Inst. of Petrochem. Synthesis, Acad. of Sci., Moscow, USSR).
Polym. Bull. (Germany), vol.10, no.7-8, p.343-50 (Sept. 1983).
A study has been made concerning the static electrification of such linear flexible-chain polymers as polybutadiene, polyisoprene, and fluorine rubber with wide and narrow molecular-weight distributions at $T > T_g$. It has been found that static electrification occurs as a result of a relaxation transition of polymers from the fluid to high-elastic state, accompanied by breakdown of the specimens and their detachment from the walls confining the flow, which leads to slip-page of the polymers. This phenomenon is explained in terms of the activation theory of polymer friction. The dependence of static electrification on temperature, molecular weight, and molecular-weight distribution is determined by the effect of these parameters on the relaxation characteristics of a polymer, and, more particularly, its segmental mobility. 73.40L Semiconductor-to-semiconductor contacts, p-n junctions, and heterojunctions

119691 Resonant tunneling through quantum wells at frequencies up to 2.5 THz. T.C.L.G.Sollner, W.D.Goodhue, P.E.Tannenwald, C.D.Parker, D.D.Peck (Lincoln Lab., MIT, Lexington, MA, USA).
Appl. Phys. Lett. (USA), vol.43, no.6, p.588-90 (15 Sept. 1983).
Resonant tunneling through a single quantum well of GaAs has been observed. The current singularity and negative resistance region are dramatically improved over previous results, and detecting and mixing have been carried out at frequencies as high as 2.5 THz. Resonant tunneling features are visible in the conductance-voltage curve at room temperature and become quite pronounced in the *I-V* curves at low temperature. The high-frequency results, measured with far IR lasers, prove that the charge transport is faster than about 10^{-13} s. It may now be possible to construct practical nonlinear devices using quantum wells at millimeter and submillimeter wavelengths. (8 refs.)

119692 Epitaxial Si layer of Si-BP-Si structure. S.Sugiura, T.Yoshida, K.Shono (Faculty of Sci. & Technol., Sophia Univ., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L426-8 (July 1983).
Boron monophosphide (BP) was epitaxially grown on an Si substrate and Si was also grown on the BP. On the Si epitaxial layer, PMOS transistors and inverter and flip-flop circuits were fabricated. The CV curve measured at 1 MHz gave a donor concentration near the surface of 2×10^{16} cm^{-3}. The PMOS transistors gave a threshold voltage of -2.6 ± 0.6 V and a surface hole mobility of 230 ± 30 $cm^2/V.s.$ for SiO_2 at a thickness of 0.1 μm. (6 refs.)

119693 HgCdTe heterojunctions. P.R.Bratt (Santa Barbara Res. Center, Goleta, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1687-91 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
HgCdTe heterojunctions consisting of a wide band gap *n*-type $Hg_{1-x}Cd_xTe$ layer grown epitaxially on a narrow band gap *p*-type $Hg_{1-y}Cd_yTe$ substrate ($x > y$) were studied. The heterojunction transition region between *x* and *y* materials was found to be graded over distances of about 0.4 to 0.8 μm. The position of the *p-n* junction depletion layer within the graded transition region was the major factor controlling the heterojunction properties. When the depletion layer was located near the narrow band gap material, normal photodiode behavior was observed. When the depletion layer was at the center of the transition region or near the wide band gap material, a potential barrier was formed which inhibited minority carrier photocurrent originating in the *p*-type material from crossing the heterojunction. Qualitative energy band models based on the analysis of HgCdTe heterojunctions recently published

by Migliorato and White (1983) were constructed to explain the observed results. (10 refs.)

119694 On the determination of the energy band offsets in $Hg_{1-x}Cd_xTe$ heterojunctions. T.N.Casselman (Santa Barbara Res. Center, Goleta, CA, USA), A.Sher, J.Silberman, W.E.Spicer, A.B.Chen.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1692-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The energy band offsets play a critical role in the electrical properties of heterojunctions. The authors raise here serious questions regarding the precision and accuracy of the measured and calculated energy band offsets in HgCdTe heterostructures. They argue that the Anderson model prescription for the offsets is not useful and is not correct for abrupt heterojunctions when narrow band gap semiconductors are the constituents of the heterostructure. New values for the photoionization energy of $Hg_{1-x}Cd_xTe$ are given and the reliability of these values for determining the offset is discussed. (13 refs.)

119695 Multibarrier tunneling in $Ga_{1-x}Al_xAs$/GaAs heterostructures. M.O.Vassell, J.Lee, H.F.Lockwood (GTE Labs. Inc., Waltham, MA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5206-13 (Sept. 1983).
A theoretical study of resonant tunneling in multilayered $Ga_{1-x}Al_xAs$/GaAs structures is presented. The spectrum of resonant energies and its dependence on the barrier structure are analyzed from calculated profiles of barrier transparency versus energy, and from current-voltage characteristics computed at selected temperatures and Fermi levels. The present formalism is based on the effective mass approximation as done to date, but contains three significant improvements: a more realistic treatment of the spatial dependence of effective masses and band edges; the recognition of the special dynamical role played by the transverse energy as a consequence of the difference in itinerant two dimensional carrier motion from layer to layer; and the avoidance of plane-wave or WKB approximations for calculating the wave function in favor of direct numerical evaluation. It is shown that these revisions lead to quantitative differences with results of previous work. (17 refs.)

119696 Persistent photoconductivity in (Al,Ga)As/GaAs modulation doped structures: dependence on structure and growth temperature. J.Klem, W.T.Masselink, D.Arnold, R.Fischer, T.J.Drummond, H.Morkoc (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA), K.Lee, M.S.Shur.
J. Appl. Phys. (USA), vol.54, no.9, p.5214-17 (Sept. 1983).
When modulation doped (Al,Ga)As/GaAs heterostructures are exposed to light, the interface electron concentration and in most cases the mobility increases substantially for lattice temperatures below ~100K. A substantial part of the increase is persistent and attributed to the excitation of electrons from a donor-vacancy complex in the (Al,Ga)As. The change in the free electron concentration in the (Al,Ga)As is calculated using a recently developed model for electron transfer across a modulation doped heterojunction. The persistent increase in the free electron concentration is used as a measure of the trap concentration. The magnitude of the photoconductivity response decreased with increasing growth temperature in the range 580-750°C. The dependence on Al mole fraction was studied for $0.16 \leq x \leq 1.0$ and found to be a maximum for $x \sim 0.3$. (25 refs.)

119697 A new space-charge-limited-current diode theory with analysis of Cu_xS/CdS data. L.D.Partain (Chevron Res. Co., Richmond, CA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5218-26 (Sept. 1983).
A new theory for trap controlled, space-charge-limited-current (SCLI) diode behavior has been derived. Standard approaches have been modified so that only the drift component of current transport is considered along with the asymmetric boundary conditions required for rectification. Simple analytical expressions for the current-voltage properties were obtained for the single-trapping level case. A straightforward, numerical integration scheme was developed for the multiple trapping level situation. Application of the results to Cu_xS/CdS current-voltage data provides the first SCLI explanation for rectification in these devices. Electron trapping levels at 0.60, 0.44 and 0.20 eV below the conduction band edge with respective concentrations of $3(10^{15})$, $6(10^{14})$, and $3.1(10^{17})$ cm^{-3} were identified. These parameters compare well to electron traps reported in the literature for Cu_xS/CdS and gold/CdS diodes measured by deep-level-transient spectroscopy (DLTS), admittance spectroscopy, and by SCLI analysis. (38 refs.)

119698 Theory of the magnetophonon effect for the two-dimensional electron gas in semiconducting heterostructures. R.Lassnig (Inst. of Experimental Phys., Univ. of Innsbruck, Innsbruck, Austria), W.Zawadzki.
J. Phys. C (GB), vol.16, no.28, p.5435-40 (10 Oct. 1983).
The theory of the transverse magnetophonon effect is developed for inversion layers in semiconducting heterostructures in the presence of a quantising magnetic field perpendicular to the interface. It is assumed that the electrons move in quasi-two-dimensional sub-bands, and that the optic phonons and the polar electron-phonon interaction are not modified by the presence of the interface. Collisional broadening of the Landau levels is taken into account. The theoretical results show a good agreement with the experimental results for the magnetophonon effect in GaAs/AlGaAs heterostructures. (11 refs.)

119699 Two-dimensional magneto-quantum transport on GaAs-$Al_xGa_{1-x}As$ heterostructures under non-ohmic conditions. G.Eber, K.von Klitzing (Phys.-Dept., Tech. Univ., Munchen, Garching, Germany), K.Ploog, G.Weinmann.
J. Phys. C (GB), vol.16, no.28, p.5441-8 (10 Oct. 1983).
Measurements of the conductivity σ_{xx} in the minima of the Shubnikov-de Haas oscillations on GaAs-$Al_xGa_{1-x}As$ heterostructures show that at helium temperatures a strong non-ohmic behaviour is observed with an instability in the current-voltage characteristic at electric field values of about 100 V cm^{-1} at B=7T. The data are analysed on the basis of an electric-field-dependent electron temperature. (15 refs.)

119700 Deep centers in semiconductor devices: mean lifetime control. J.Barbolla, L.A.Bailon.
Mundo Electron. (Spain), no.132, p.87-92 (Oct. 1983). In Spanish.
The authors discuss the most frequent processes of emission and capture of carriers by a deep center in a semiconductor. The study is centered on thermal emission and capture. The mean lifetime of the free carriers in a semiconductor, controlled by the presence of a bipolar deep center, is defined and calculated. Also calculated is the reverse current of a junction due to the thermal generation of the carriers by a polar deep center in the space-charge region of the junction. The conditions that a deep center should fulfil, so that the mean lifetime of free carriers in a semiconductor is as short as possible while the reverse current of a junction due to the thermal generation of the carriers is as small as possible, are studied. (7 refs.)

119701 Electrical properties of junctions between sputter deposited silicon films and monocrystalline silicon. J.Koshy (Dept. of Phys., Federal Univ. of Technol., Bauchi, Nigeria).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K21-4 (Sept. 1983).
The author discusses the properties of junctions formed by sputter deposited a-Si films onto chemically etched n and p-Si crystals. I-U and C-U measurements on the junctions were used to calculate the barrier height and the density of states at the Fermi level of sputter deposited a-Si films for the first time. (10 refs.)

119702 Variational calculations on a quantum well in an electric field. G.Bastard, E.E.Mendez, L.L.Chang, L.Esaki (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3241-5 (15 Sept. 1983).
The authors present variational calculations of the eigenstates in an isolated-quantum-well structure subjected to an external electric field. At weak fields a quadratic Stark shift is found whose magnitude depends strongly on the finite well depth. In addition, the electric field induces a spatial shift of the particle wave function along or opposite to the field direction, depending on the sign of the particle mass. This field-induced spatial separation of conduction and valence electrons in GaAs quantum wells decreases the overlap between their associated wave functions, leading to a reduction of interband recombination. (15 refs.)

119703 Subbands in back-gated heterojunctions. B.Vinter (Div. Composants Microonde, Thomson-CSF, Orsay, France).
Solid State Commun. (USA), vol.48, no.2, p.151-4 (Oct. 1983).
The subband structure at low temperature of an $Al_xGa_{1-x}As$/GaAs heterojunction in which the density is modulated by a gate on the GaAs substrate has been calculated with full account of tunnelling between the two sides of the junction. The results show that when the first excited subband is occupied, the number of electrons in the lowest subband remains essentially constant independent of back-gate voltage, in agreement with a recent experiment. Comparison of the calculated density at which the first excited subband starts being occupied with the experiment indicates that the doping impurities behave quite differently in AlGaAs than in GaAs, even for an Al concentration of 0.22. 73.40M Semiconductor-electrolyte contacts

119704 Polypyrrole electrodes, charge transfer to aqueous and solid polymer electrolytes. T.A.Skotheim (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA), S.W.Feldberg, M.B.Armand.
J. Phys. Colloq. (France), vol.44, no.C-3, p.615-20 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have studied interfaces between conducting polypyrrole and aqueous and solid polymer electrolytes. Polypyrrole is porous to solvent and electrolyte ions but not to solid polymer electrolytes. Contrasting the two interfaces shows unambiguously that the porosity, and consequently large actual surface area, is responsible for the observed rapid rate of charge transfer to ionic species in solution. (13 refs.)

119705 Influence of hydrogen reduction on photoelectrochemical behavior of anodic oxidized n-TiO_2-layers. K.J.Hartig, N.Getoff (Inst. fur Theoretische Chem. und Strahlenchem., Univ. Wien, Wien, Austria), K.D.Kotchev, St.Kanev.
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.167-76 (July-Sept. 1983).
The behavior of polycrystalline n-TiO_2-photoanodes produced by anodic oxidation of Ti-metal foils and subsequently reduced in hydrogen atmosphere at various temperatures and different times was investigated. The employed methods for their characterization were: scanning electron microscopy, X-ray diffraction, thickness determination, open-circuit voltage and capacitance/voltage studies as well as photoelectrochemical measurements. The reduction process results in an increase of oxygen deficiencies and a decrease of the amount of recombination centers and of grain boundary energy barriers between the crystallites. All these parameters lead to a significant increase of the photoefficiency. The best photoanodes were obtained, when the anodically oxidized samples were reduced under hydrogen at 800-850°C for 15 min (conversion of anatase to rutile crystal structures). (17 refs.)

(inc. semiconductor-to-insulator)

119706 Gold diffusion through silicon dioxide. G.R.Moghal (Appl. Phys. & Instrumentation Technol. Div., PCSIR Labs., Karachi, Pakistan).
Mehran Univ. Res. J. Eng. & Technol. (Pakistan), vol.2, no.2, p.1-4 (April 1983). [received: Oct. 1983]
Gold introduces positive surface charge at the silicon/silicon dioxide interface when diffused from the front side of the silicon device. This leads to a shift of MOS device characteristics towards negative gate biases. It is also found that the positive surface charge due to gold in the oxide is independent of temperature. (7 refs.)

119707 The physics and applications of the two-dimensional electron gas. M.J.Kelly.
GEC J. Res. Incorp. Marconi Rev. (GB), vol.1, no.1, p.15-23 (1983).
The confinement of electrons to within 10-20 nm of the Si/SiO_2 or $GaAs/Ga_{1-x}Al_xAs$ interface provides not only the heart of modern microelectronics, but also a particulary fertile and flexible system for the study of basic physics. Tools developed over many decades in metal physics have all been applied to this two-dimensional metallic system within the last decade, providing ideas for ultra-fast device structures and elucidating quantum processes in electronic transport, in which respect, the quantum Hall effect, a new resistance standard, has been a crowning achievement. (43 refs.)

119708 Techniques for improving the Si-SiO_2 interface characterization. A.Sher (SRI Internat., Menlo Park, CA, USA), H.J.Hoffman, Pin Su, Y.H.Tsuo.
J. Appl. Phys. (USA), vol.54, no.9, p.5183-98 (Sept. 1983).
In a companion paper [P. Su, A. Sher, Y.H. Tsuo, J.A. Moriarty, and W.E. Miller, Appl. Phys. Lett. 36, 991 (1980)], an improved characterization of the Si-SiO_2 interface in metal-insulator-semiconductor-capacitor (MIS-C) structures was reported. In this paper, details of the refined experimental methods that lead to those results are presented, and a more extensive interpretation offered. The well-established quasistatic and conductance methods are improved by using (i) effectively thin composite insulators, (ii) low carrier concentration substrates, and most importantly (iii) low-level illumination at a wavelength that creates electron-hole pairs. Items (i) and (ii) extend the dynamic range of the interface-state density measurement to four decades. Item (iii) decreases the response time of the slow states (for *n*-type samples, those in the lower part of the band gap); thus, the quasistatic condition is well satisfied and the conductance method can be used on all the states throughout the band gap. Without illumination, the quasistatic condition is not satisfied, even for ramp rates on the low side of those used previously. The major consequences of not satisfying the quasistatic condition are that the deduced variation in surface potential is too large, the interface-state density is underestimated, and the positive-fixed-charge density is overestimated. The sample investigated had a 250-Å, thermally grown oxide prepared in dry oxygen. It was never exposed to H_2 or H_2O at an elevated temperature. The authors spectulate that this processing produces an abrupt Si-SiO_2 interface. The composite gate insulator was completed by having an *e*-gun deposited 250 Å of LaF_3. The resulting interface, subjected to the improved experimental method, yields a wealth of distinctive structure rather than the often-reported featureless U-shaped interface-state density. (37 refs.)

119709 A new transient capacitance technique for the determination of interface traps in metal-oxide semiconductor transistors. P.Vitanov (Inst. of Microelectronics, Sofia, Bulgaria), I.Eisele.
J. Appl. Phys. (USA), vol.54, no.9, p.5227-30 (Sept. 1983).
A new method for determining the interface trap distribution is described. The measurements are performed on *n*-channel metal-oxide-semiconductor field-effect transistors and yield the densities of interface traps near the minority carrier band $(0.04<E_t-E_c<0.3)$. The technique reveals trap densities as low as 2×10^8 cm^{-2} eV^{-1}. The sensitivity is high enough to still detect capacitance changes of the order of 0.01 pF out of the noise. The method is applicable to samples with nonuniform doping concentrations. (12 refs.)

119710 Electric field induced effects at the Si-SiO_2 interface: theory and experiment. M.G.Ancona (Naval Res. Lab., Washington, DC, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5231-9 (Sept. 1983).
In a previous paper the fully macroscopic description of semiconductors was employed to demonstrate on theoretical grounds that the surface charge density at a semiconductor interface, as measured statically, depends not only on surface potential but also on surface electric field. In the present work, further theoretical discussion of this effect is given and, most importantly, experimental evidence demonstrating its existence and significance at Si-SiO_2 interfaces is obtained. In particular, it appears necessary to describe certain features of the admittance of a metal-oxide-semiconductor capacitor in inversion not explained by conventional theory. The coefficient quantifying these electric field effects, which is determined for particular samples, represents an additional independent parameter by which interfaces may be characterized. The importance of the effect in the interface description leads to a clearer macroscopic understanding of the meaning of the 'interface state density' (D_{it}) which is commonly determined from macroscopic (electrical) experiments. And, in connection with the underlying microscopic picture, its significance may provide experimental support for the microscopic bond strain model for the origin of interface states. (20 refs.)

119711 Energy concepts of insulator-semiconductor interface traps. O.Engstrom (Nat. Defence Res. Inst., Linkoping, Sweden), A.Alm.
J. Appl. Phys. (USA), vol.54, no.9, p.5240-4 (Sept. 1983).
A general statistical language developed for impurities and defects in semiconductors has been applied to the interpretation of experimental results from different methods of investigations of insulator-semiconductor interface traps. Interface state energy distributions obtained from traditional capacitance-voltage methods or 'scanned light pulse technique' are interpreted in a Gibbs free energy scale. On the other hand, distributions obtained from deep level transient spectroscopy (DLTS) are put on an enthalpy scale. The difference between the two parameters depends on the entropy properties of the trap centers. Carrier capture data taken from DLTS are demonstrated to be influenced by the 'entropy factor' of the interface trap resulting in discrepancies of capture cross sections of up to two orders of magnitude. It is further pointed out that the energy resolution of experimental energy state distributions is fairly rough for different methods ranging up to 0.1 eV for the *CV* technique at room temperature. (20 refs.)

119712 Scanned light pulse technique for the investigation of insulator-semiconductor interfaces. O.Engstrom, A.Carlsson (Nat. Defence Res. Inst., Linkoping, Sweden).
J. Appl. Phys. (USA), vol.54, no.9, p.5245-51 (Sept. 1983).
A new measurement method, scanned light pulse technique, for the investigation of the interface properties of metal-insulator-semiconductor (MIS) structures is introduced. The measured signal is the charge contents of current transients induced by light pulses applied to the investigated sample. This signal depends on surface potential, interface state density and voltage applied to the MIS structure. By analyzing the results of such measurements it is quantitatively demonstrated how insulator charge and interface state distribution influence the voltage dependence. By scanning a light spot across the surface of an MIS structure with transparent metal electrode it is further shown that pictures of the spatial variation of the surface potential and the interface state density can be obtained. (18 refs.)

119713 Trap-assisted tunneling in MIS and Schottky structures. F.Capabadal, V.Milain, X.Aymerich-Humet (Dept. d'Electricitat i Electronica, Univ. Autonoma de Barcelona, Barcelona, Spain).
Phys. Status Solidi a (Germany), vol.79, no.1, p.223-36 (Sept. 1983).
Trap-assisted tunneling current in metal-insulator-semiconductor and metal-semiconductor (Schottky) structures with traps in the insulator and in the semiconductor, respectively, is obtained, using the stationary resonance model. The two-band model is considered for the insulator gap of the MIS structure, introducing an effective potential barrier. A comparison between resonant and direct tunneling currents in MIS structures is performed, showing that the main conduction mechanisms is determined by the trap density, the oxide thickness, and the trap depth. For the Schottky diodes, the resonant current-voltage characteristic is analysed as function of the centre of resonance of the system. A discussion between resonant tunneling in MIS and Schottky structures is also included. (25 refs.)

119714 Stress effects on the switching voltage of metal-SnO_2-Si(n)-Si(p^+) devices. H.K.Phan, L.H.Phu, C.V.Chiem (Inst. of Phys., Hanoi, Vietnam).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K25-8 (Sept. 1983).
The authors report a first experimental study of the stress effects on the current-voltage characteristics of metal-SnO_2-Si(n)-Si(p^+) devices. Among the observed effects the most noticeable one is the decrease of the switching voltage with increasing stress. This effect is reversible. (8 refs.)

119715 XPS studies on thermal switching in thick film Al-VP glass-Al structure. M.S.Setty, S.R.Sainkar, A.P.B.Sinha (Phys. Chem. Div., Nat. Chem. Lab., Poona, India).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L381-2 (July 1983).
Thick film sandwich structures of Me-VP glass-Me (Me=Au, Al) have been prepared. The I-V characteristics are nonlinear in all cases but thermal switching has been observed only in Al-VP glass-Al structure. Presence of VO_2 was identified from XPS studies in the vanadium phosphate glass in the post breakdown state. (15 refs.)

73.60 ELECTRONIC PROPERTIES OF THIN FILMS

119716 The properties of Cr-Si-O thin film resistors by DC conventional sputtering. K.Furuta, S.Miyagawa (Totsuka Works, Hitachi Ltd., Yokohama, Japan), T.Kamei, H.Ando.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1565-6 (1983).
Cr-Si-O thin film resistors deposited by DC conventional sputtering and subjected to a proper stabilization heat treatment have been shown to have excellent resistance against oxidation and good stability over a long period of time. The sputter current dependence of the electrical properties and microstructure of the Cr-Si-O is highlighted. (4 refs.)

119717 Physical interpretation of weak localization: a time-of-flight experiment with conduction electrons. G.Bergmann (Inst. fur Festkorperforschung, Kernforschungsanlage Julich, Julich, Germany).
Phys. Rev. B (USA), vol.28, no.6, p.2914-20 (15 Sept. 1983).
The resistance of two-dimensional electron systems such as thin disordered films shows deviations from Boltmann theory, which are caused by quantum corrections and are called 'weak localization'. Theoretically, weak localization is originated by the Langer-Neal graph in the Kubo formalism. In the present paper this graph is translated into a transparent physical picture. It represents an interference experiment with conduction electrons split into pairs of waves interfering in the backscattering direction. The intensity of the interference (integrated over the time) can be easily measured by the resistance of the film. A simple derivation for this quantum correction to the resistance is given. A magnetic field introduces a magnetic phase shift in the electronic wave function and suppresses the intereference after a 'flight' time proportional to $1/H$. Therefore, the application of a magnetic field allows observation of the fate of the electron as a function of time. Spin-orbit coupling rotates the spin of the electrons and yields an observable destructive interference, thereby demonstrating the change of sign of the electron-spin function by rotation. Magnetic impurities destroy the coherence of the phase. Therefore, with magnetoresistance measurements one can determine the inelastic lifetime, the spin-orbit coupling time, and the magnetic scattering time of the conduction electrons. (43 refs.)

73.60D Metallic thin films

119718 Electrical, optical, and structural properties of semitransparent metallic layers. S.Kar, R.Varghese, S.Bhattacharya (Dept. of Electrical Engng., Indian Inst. of Technol., Kanpur, India).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1420-4 (1983).
Electrical, optical, and structural properties of ultrathin films of Ag, Au, and Al were investigated. MOS solar cells were fabricated with Ag, and Au barrier metals on *n*-type and with Al barrier metal on *p*-type silicon. The short-circuit current density J_{sc} was measured as a function of the average metal layer thickness t_n. The film structure was examined under a transmission electron microscope. The optical transmittance T was measured as a function of the wavelength λ with t_m as a parameter. The transmission electromicrographs indicated that, in the Ag and Au case, the film network structure attained electrical continuity at a lower value of t_m than in the case of Al. Also, in the Ag and Au case, surface covered by the film was lower. Largely due to this, optical transmittance was higher in the Ag and Au case than in the case of Al. The $T(\lambda)$ characteristics exhibited strong features in the Ag and Au case but not in the Al case. The profiles of $J_{sc}(t_m)$ were found to be peaked with the maximum occurring around 55 Å for Ag and Au and around 70 Å for Al. Furthermore, the peaks were sharp in the Al case, but were broad in the Ag and Au case. Also, the peak values were larger in the

Ag and Au case. The higher rate of degradation of Ag and Au MOS cells than AlMOS cells can be related to the presence of large discontinuity in Ag and Au films. (10 refs.)

119719 Electrical conductivity of non-homogeneous Au films on glass. G.Grimvall (Dept. of Theoretical Phys., Royal Inst. of Technol., Stockholm, Sweden), T.G.Andersson.
J. Phys. D (GB), vol.16, no.10, p.1985-91 (14 Oct. 1983).
The sheet resistance has been measured at room temperature for non-homogeneous thin gold films deposited on a glass substrate. A non-ohmic behaviour is observed when the applied electric field exceeds a certain critical value which varies strongly with surface coverage. An effective two-phase conductivity model gives a good qualitative account of the observed sheet resistance and the critical field as a function of the amount of metal deposited. (11 refs.)

119720 Effects of 'weak' localization and of electron-electon interaction in thin copper and silver films. M.E.Gershenzon, B.N.Gubankov, Yu.E.Zhuravlev (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1362-9 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2348-61 (Dec. 1982). [received: Oct. 1983]
The temperature and field dependences of the resistance of thin copper and silver films with surface-square resistances $R_{\square} \approx 3\text{-}400\Omega$ were investigated at temperatures T=1.4-100K and in magnetic fields H=0-70 kOe parallel as well as perpendicular to the film plane. The observed R(T) and R(H) dependences can be explained within the framework of a theory that takes into account the joint manifestations of the effects of 'weak' localization and electron-electron interaction in two-dimensional disordered systems. A comparison of the experimental data with the theory yields information on the energy and spin relaxation of the conduction electrons. (27 refs.)

119721 Carrier depletion in sulfur doped epitaxial GaAs layer by boron ion implantation. T.Itoh, M.Nomura (School of Sci. & Engng., Waseda Univ., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L389-90 (July 1983).
The carrier depletion by boron ion implantation in sulfur doped epitaxial GaAs layers has been investigated. The diffusion coefficient of boron in GaAs is rather small and the carrier depleted region in a sulfur doped epi-layer formed by boron ion implantation remains stable after a thermal treatment at 800°C for 20 min by the powder annealing method. The implanted boron atoms deplete carriers in the sulfur doped layer, and concentration profiles of calculated residual carriers using an empirical formula agree well with experimental results. (8 refs.)

119722 Characterization of SOS films grown with amorphous Si buffer layers by MOS FETs. M.Ishida, Y.Yasuda, H.Wakamatsu, H.Abe, T.Nishinaga, T.Nakamura (Dept. of Electrical Engng., Toyohashi Univ. of Technol., Toyohashi, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L438-40 (July 1983).
Electrical properties of Si films grown epitaxially on sapphire substrates with amorphous Si buffer layers (less than 40 Å) have been studied by fabricating n-channel MOS FETs. The effective mobility of the MOS FETs fabricated on SOS with the buffer layer was 1.36 to 1.5 times as large as the one without the buffer layer, at $V_G - V_T = 4$ V. The SOS film was grown at a slow growth rate (550 Å/min) and thickness was 0.55 μm. This result indicates that the present growth method is useful for thinning Si films as VLSI devices. (7 refs.)

119723 A study on the purity and SIMS profiling of MOVPE-cadmium mercury telluride. J.B.Mullin, S.J.C.Irvine, A.Royle, J.Tunnicliffe (Royal Signals & Radar Establ., Great Malvern, England), G.Blackmore, R.Holland.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1612-14 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
A preliminary study has been carried out on the electrical properties and chemical purity of epitaxial layers of cadmium mercury telluride (CMT) grown by metal-organic vapor phase epitaxy (MOVPE). It has been shown that the mobility of such layers grown at 410°C are comparable with bulk CMT of equivalent carrier concentration. SIMS profile studies of trace impurities in the epitaxial layers and CdTe substrates used for epitaxial deposition revealed significant impurity concentration enhancement (ICE effect) for a number of elements (Li,Na,K,Al,Ga,In, and Mn) at the CdTe/CMT interface: some of these elements (Li,Na,K,Al and In) also showed this ice effect at the subsequent CMT/CdTe interface. The magnitude of the ICE effect could be quite large (a factor ~100 for Li) but its origin was not identified although potential mechanisms for its formation are discussed. (10 refs.)

119724 Minority carrier lifetime in LPE $Hg_{1-x}Cd_xTe$. J.Bajaj, S.H.Shin, J.G.Pasko, M.Khoshnevisan (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1749-51 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The authors report measurements on the minority carrier lifetime in *n*-type and *p*-type LPE $Hg_{1-x}Cd_xTe$/CdTe with $x \sim 0.2$. For *n*-HgCdTe, they have measured lifetimes of 4-7 μs at 77K for passivated samples. These values are comparable to the results reported for bulk material. For *p*-HgCdTe epilayers with thickness ≤20 μm, the measured lifetime is 15-20 ns at 77K and is suspected to be limited by surface recombination. With excitation through the CdT substrate, they have attempted to measure the bulk lifetime; preliminary results are reported. (5 refs.)

119725 Conductivity of heterocondensates of CdTe. I.V.Zavalin, I.V.Potykevich, N.B.Kuleshov (Inst. of Cybernetics, Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.10, p.1464-7 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1705-8 (Oct. 1982). [received: Sept. 1983]
The electrical conductivity of cadmium telluride films was studied over a wide temperature range for different values of the nucleation parameters and growth parameters of the films. The conductivity of single-crystal CdTe films varies nonmonotonically with the rate of deposition of the condensate. A film thickness equal to 6 μm is characteristic, since at 330K the depth of the Debye curvature of the bands equals 6.1 μm. (3 refs.)

119726 Semiconducting behavior of Ag_2Te thin films and the dependence of band gap on thickness. V.Damodara Das, D.Karunakaran (Dept. of Phys., Indian Inst. of Technol., Madras, India).
J. Appl. Phys. (USA), vol.54, no.9, p.5252-5 (Sept. 1983).
Thin films of Ag_2Te of various thicknesses in the range 500-1500 Å have been prepared by thermal evaporation of the compound under vacuum on clean glass substrates held at room temperature. The electrical resistance of the films has been measured as a function of temperature during heating, which was carried out immediately after the film formation. The observed exponential decrease of resistance with temperature up to the transition point points to the semiconducting nature of the low temperature polymorph of Ag_2Te. The band gap of the low temperature phase is calculated for various thicknesses of the films and it is found that the band gap is a function of film thickness, increasing with decreasing thickness. The increase in the band gap, which was found to be inversely proportional to the square of the film thickness, is attributed to quantization of the electron momentum component normal to the film plane. (24 refs.)

119727 Highly doped amorphous silicon without hydrogen. R.W.Fane, Y.Zaka (Dept. of Phys., Univ. of Aston, Birmingham, England).
J. Phys. D (GB), vol.16, no.10, p.1993-8 (14 Oct. 1983).
Amorphous silicon films with high intrinsic resistivity have been produced by RF sputtering without the addition of hydrogen or halogen. Co-sputtering with tantalum resulted in n-type material with resistivity<1 Ω cm and a shift in the Fermi level of 0.6 eV. (16 refs.)

119728 Substituted polyacetylenes by cyclopolymerization: poly(1,6-heptadiyne) and poly(propiolic anhydride). H.W.Gibson (Webster Res. Center, Xerox Corp., Webster, NY, USA), A.J.Epstein, H.Rommelmann, D.B.Tanner, Xiao-Quing, Yang, J.M.Pochan.
J. Phys. Colloq. (France), vol.44, no.C-3, p.651-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Two substituted polyacetylenes, poly(1,6-heptadiyne) and poly(propiolic anhydride), have been synthesized by cyclopolymerization of diacetylenic precursors. The former polymer has been examined in some detail. Under suitable conditions, it can be doped to a conductivity (σ) of ~1 s/cm. It displays a number of contrasts to polyacetylene in its morphology, lack of crystallinity, and electron spin resonance behavior. Poly(propiolic anhydride) has been examined only in a preliminary manner; however, this system offers the possibility for generation of a range of substitutents by facile modification of the starting monomer or the product polymer. Cyclopolymerization is a feasible route for synthesis of a family of conducting polymers. (18 refs.)

119729 Synthesis and characterization of highly conducting, environmentally stable, iodine complexes of a soluble poly N-methyl 3,3′ carbazolyl. S.T.Wellinghoff (Univ. of Minnesota, Minneapolis, MN, USA), T.Kedrowski, S.Jenekhe, H.Ishida.
J. Phys. Colloq. (France), vol.44, no.C-3, p.677-81 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Polly N-methyl 3′,3 carbazoly (PC) can be prepared by forming the di-Grignard reagent of 3′,3 dibromo N-methyl carbazole with highly activated magnesium and subsequently adding this reagent to a tetrahydrofuran suspension containing a catalytic amount of nickle complex. The tan yellow PC isolated from this reaction mixture was soluble in a number of 'acceptor' type solvents such as nitrobenzene. Thin, clear yellow films could be cast and were easily doped with I_2, Br_2 to form tough black films. Completely doped PC semiconductors containing one I atom per carbazole monomer unit, exhibited conductivities as high as 1 ohm^{-1} cm^{-1} with an activation energy for DC conduction of 0.172 eV. Together with the featureless absorbance spectrum shown by the I_2 doped films from 0.3 μ to 25 μ these electrical properties suggest hopping as the charge transport mechanism in these amorphous materials. The carbazole radical cations were sufficiently stable in the complexes to maintain this electrical conductivity unchanged in room air at 25°C for at least 1 month. (21 refs.)

119730 Electrical conductivity of doped polyacrylonitrile $(PAN)^+$. H.Teoh, D.MacInnes,Jr., P.D.Metz (Solar & Renewables Div., Brookhaven Nat. Lab., Upton, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.687-91 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The electrical conductivity and optical absorption spectra of halogen doped PAN have been investigated. When films of PAN previously heated in vacuum to 280°C are exposed to bromine or iodine vapor the conductivity rises suddenly. The conductivity is reduced by pumping off the vapor, but upon subsequent reheating the conductivity increases dramatically, with a transition occurring at about 270°C. Undoped samples were previously reported to undergo a similar transition above 390°C. All samples obey $\sigma\ \alpha\ T^{-1/4}$ behavior, suggesting 3-dimensional variable range hopping as the conduction mechanism. The optical and infrared absorption spectra of doped PAN are compared to those previously reported for the undoped material. The stability of doped PAN in air is also discussed. (12 refs.)

119731 Temperature and thickness dependence of electrical conductivity of flash-evaporated InSb films. A.K.Sharma (Dept. of Phys., Sri Venkateswara Univ., Tirupati, India), P.Jayarama Reddy.
Phys. Status Solidi a (Germany), vol.79, no.1, p.183-8 (Sept. 1983).
The electrical conductivity as a function of film temperature, substrate temperature, and thickness is reported on InSb films flash evaporated onto gold seal glass, freshly cleaved mica and cleaved NaCl substrates in a vacuum of 6.7×10^{-4} Pa. Post deposition annealing shows an interesting behaviour in the electrical conductivity. The structure of the films is found to improve with substrate temperature and single crystal growth is observed at $T_s = 573$K. While the electrical conductivity shows an increasing behaviour with substrate temperature and thickness, the activation energy shows a decreasing trend. (11 refs.)

119732 Ion plated transparent conductive films. M.El-Sherbiny (King Abdulaziz Univ., Jeddah, Saudi Arabia), F.Salem, A.Aboukhashaba.
Vak.-Tech. (Germany), vol.32, no.6, p.168-73 (Sept. 1983).
Indium tin oxide (ITO) films are deposited by conventional reactive ion plating on glass substrates. Transparent conductive films of various compositions are tested for resistivity and optical transmission. Film nucleation and growth are investigated, and finally some adhesion test results are reported. Minimum resistivity is achieved with tin concentrations within the range of 30-40% whilst optical transmission is fluctuating above a minimum of 82% for wavelengths within the range of 500-1000 nm. 119733 Electron trapping/detrapping within thin SiO_2 films in the high field tunneling regime. P.Olivo, B.Ricco, E.Sangiorgi (Istituto di Elettronica, Univ. di Bologna, Bologna, Italy).
J. Appl. Phys. (USA), vol.54, no.9, p.5267-76 (Sept. 1983).
Presents the essential features of a model for the electrical behavior of thin SiO_2 films in the high field tunneling regime. In particular the carrier trapping/detrapping phenomena, taking place within the insulator and responsible for the current time dependence at constant applied voltages, are considered: the suggestion is proposed that all the oxide Si-O bonds take active part in such processes and explanations are consequently derived for some aspects of previous works not yet convincingly interpreted. The results of a computer program implementing the model are also presented and shown to be in satisfactory agreement with experimental curves which can be fit with a single variable parameter. 74.00 SUPERCONDUCTIVITY

74.10 OCCURRENCE, CRITICAL TEMPERATURE

119734 Dilemma of $EuMo_6X_8$ ($X=S$, Se)—possible solution. S.N.Ekbote, S.K.Gupta, A.V.Narlikar (Nat. Phys. Lab., New Delhi, India).
Curr. Sci. (India), vol.52, no.15, p.716-18 (5 Aug. 1983).
Amongst Chevrel phase compounds, $REMo_6X_8$, where RE:La, Ce, Pr, Eu, Gd, Lu, etc. and X:S, Se, Te, $EuMo_6S_8$ and $EuMo_6Se_8$ are of particular interest as both of them show rather unexpected properties which still remain to be understood. From theoretical considerations both of them are expected to exhibit superconductivity at ambient pressure with appreciable T_c, which is contrary to the experimental observations. Under a pressure of 7 kbar, however, $Eu_{1.2}Mo_6S_8$ becomes superconducting at about 11K whereas $Eu_{1.2}Mo_6Se_8$ does not show superconductivity up to pressures of 25 kbar. The reason for the dilemma is not unambiguously known and the suggested reasons like sharp variation of $N(E_F)^5$, and magnetic to nonmagnetic transitions for Eu ions are not found to be experimentally true. The ESR studies reported seem to resolve the dilemma. (21 refs.)

119735 Numerical calculation of temperature dependent superconducting transition in inhomogeneous superconductors. E.Yu.Klimenko, A.E.Trenin (Kurchatov Atomic Energy Inst., Moscow, USSR).
Cryogenics (GB), vol.23, no.10, p.527-30 (Oct. 1983).
The temperature dependent calculation of the resistance of a series-parallel circuit consisting of superconducting elements and the critical temperatures described by the Gaussian distribution, permits a semi-empirical description of the type-III superconductor transition. $E=\rho_n j\exp(-Tc/To+T/To+B/Bo+j/jo)$. An explanation of the experimentally observed dependence of the increasing parameters on the magnetic field and temperature is given on the basis of the calculation results. (9 refs.)

119736 Normal to ferromagnetic superconducting transition. P.Bhattacharyya (Tata Inst. of Fundamental Res., Bombay, India).
J. Phys. C (GB), vol.16, no.28, p.L1011-14 (10 Oct. 1983).
A lattice model of the electromagnetically coupled ferromagnetic superconductor is studied. It is argued that the transition from the normal state to one in which superconductivity coexists with uniform magnetisation should show an inverted λ anomaly and under suitable conditions could be experimentally detectable. The contrasts with earlier predictions of a fluctuation-induced first-order transition. (12 refs.)

119737 Cooperative phenomenon in ternary superconductors. S.L.Kakani (Dept. of Phys., MLV Government Coll., Bhilwra, India).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.221-53 (Oct. 1983).
A microscopic theory of ferromagnetic superconductors is developed from first principles. Self-consistent equations for the superconducting order parameter Δ and spontaneous magnetization $<S^z>$ are derived using a Green's function technique and considering the *f-d* exchange effect up to the second order. The theory is applied to explain the experimental results in the reentrant superconducting ternary system $ErRh_4B_4$. The present model explains reentrant behaviour, predicts the coexistence of superconductivity and ferromagnetism in a very small range of temperature, the suppression of superconductivity by ferromagnetism, and vice versa. These results are in excellent agreement with the experimental data and predictions of other models. The behaviour of the spontaneous magnetization, the superconducting order parameter, the specific heat, and the density of states is also studied. (66 refs.)

119738 The Bechgaard phase, asymmetric anions and $T_c>3K$. R.C.Lacoe, P.M.Chaikin (Dept. of Phys., Univ. of California, Los Angeles, CA, USA), F.Wudl, E.Aharon-Shalom.
J. Phys. Colloq. (France), vol.44, no.C-3, p.767-74 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have synthesized a new organic conducting salt utilizing a small asymmetric anion with a permanent dipole moment: $(TMTSF)_2FSO_3$. The phase diagram is very similar to that of the ReO_4^- salt, exhibiting an anion ordering and simultaneous metal-insulator transition at low pressure, a 'glassy' phase for P~6 kbar, and superconductivity for higher pressures. The superconducting transition temperature is the highest yet observed for an organic conductor with an onset above 3K and a midpoint for the transition above 2K. The authors present anisotropic critical field data for the superconducting phase and transport measurements for the glass phase. (22 refs.)

119739 Organic superconductors: three years only!. D.Jerome (Lab. de Phys des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.775-82 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The author gives an overview on the rapidly expanding field of organic superconductors. The numerous amount of experimental data which suggests that their one-dimensional physics is closely related to their physical properties is particularly emphasized. (36 refs.)

119740 A sulphur based organic molecular superconductor: $(BEDT\text{-}TTF)_4(ReO_4)_2$. S.S.P.Parkin, E.M.Engler, R.R.Schumaker, R.Lagier, V.Y.Lee, J.Voiron, K.Carneiro, J.C.Scott, R.L.Greene (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.791-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have prepared a number of salts of the sulphur derived organic molecule, BEDT-TTF, with various anions including ReO_4, ClO_4, BF_4, PF_6 and Br. For the same anion, salt with various stoichiometries are found. For the ReO_4 anion, they have so far identified four different phases. The 2:1 salt, $(BEDT\text{-}TTF)_4(ReO_4)_2$, becomes superconducting for pressures above ~4 kbar with a transition temperature near 2K. At higher pressures, T_c falls rapidly at a rate, $dT_c/dP \sim -0.3K/kbar$. At lower pressures this salt exhibits a first order metal-insulator transition near 80K which they suggest is associated with a rearrangement of the ReO_4 anions which are ordered at room temperature. (17 refs.)

119741 Superconductivity and metal-nonmetal transitions in $(TMTSF)_2ClO_4$. T.Ishiguro, K.Murata, K.Kajimura, N.Kinoshita, H.Tokumoto, M.Tokumoto (Electrotech. Lab., Ibaraki, Japan), T.Ukachi, H.Anzai, G.Saito.
J. Phys. Colloq. (France), vol.44, no.C-3, p.831-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
$(TMTSF)_2ClO_4$ undergoes the metal-nonmetal (MN) transition above the superconductivity (SC) transition under a certain condition. The SC and MN transitions are influenced by resistance jumps and cooling speed across the order-disorder transition of ClO_4 anions. The interplay of the SC and SDW phases is discussed with regard to these influences. (21 refs.)

119742 Transport properties under pressure of the organic conductors $(TMTTF)_2X$; $X=PF_6$, ClO_4, Br. F.Creuzet, S.S.P.Parkin, D.Jerome, K.Bechgaard (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France), J.M.Fabre.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1099-103 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
According to conductivity studies, the $(TMTTF)_2X$ series shows some similarities with the selenium series. However, the critical pressure, corresponding to the suppression of the insulating ground state, 25 kbar for the bromide salt, is much higher and may be related to the stronger dimerization of the organic molecules along the stack. The authors have examined the possibility of superconductivity in $(TMTTF)_2Br$ by conductivity, AC susceptibility and magnetoresistance experiments. Although the existence of a superconducting transition around 3K is not yet fully demonstrated, superconducting short range order may be important at low temperature. (10 refs.)

119743 Coexistence of superconductivity and spin density waves: $(TMTSF)_2X$. E.W.Fenton, G.C.Psaltakis (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1129-32 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
When superconductivity coexists with a spin density wave for the same electrons, both spin-singlet and spin-triplet Cooper pair amplitudes must be significantly large. Physical properties of the coexistence state are strongly affected by the amplitude of spin-triplet Cooper pairs even when the electron-electron

interaction for triplet pairing and the triplet pair potential Δ_{TS} are both zero. (2 refs.)

119744 Correlation between superconductivity and charge-density-waves in $Nb_{1-x}Ta_xSe_3$. K.Kawabata, M.Ido, T.Sambongi (Dept. of Phys., Hokkaido Univ., Sapporo, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1647-50 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Superconducting and charge-density-wave transitions in $Nb_{1-x}Ta_xSe_3$ were examined. With addition of Ta the superconducting transition temperature Tc increases steeply up to 1.7K and begins to decrease gradually above 4.5 at.%. Such an impurity dependence of Tc can be understood in terms of the correlation with CDWs. (15 refs.)

119745 Third-harmonic susceptibility $|\chi_3|$ of quasi-one-dimensional superconductors Nb_3S_4, Nb_3Se_4, and Nb_3Te_4. T.Ishida, H.Mazaki (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan), I.Nakada.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1701-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Superconducting transition of Nb_3S_4, Nb_3Se_4, and Nb_3Te_4 has been studied in terms of fundamental and third-harmonic susceptibility. The authors give an evidence that the randomness in interchain couplings is responsible for the AC response. (6 refs.)

119746 Conduction properties of $ZrTe_3$. S.Takahashi, T.Sambongi, S.Okada (Dept. of Phys., Hokkaido Univ., Sapporo, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1733-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
$ZrTe_3$ shows a metallic resistivity and becomes superconducting at 2.0K. The anisotropy of both the resistivity and the upper critical field are two-dimensional. The transverse resistivity exhibits an anomalous hump near 70K, while there is no anomaly in the longitudinal component. The authors' temporary estimate is that this anomaly is caused by an additional scattering rather than a reduction of carriers. (7 refs.)

119747 Some properties of superconducting virtual-bound-state alloys. Y.Okabe, A.D.S.Nagi (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada).
Phys. Rev. B (USA), vol.28, no.5, p.2455-62 (1 Sept. 1983).
Using the Anderson model in the nonmagnetic limit, the authors have calculated some properties of the superconducting virtual-bound-state alloys. The calculated properties are the transition temperature T_c, the jump in specific heat at T_c, ΔC, the electronic density of states, and the tunnelling conductance. Special attention is paid to the systematic variation of these properties with the resonance width Γ. It is found that the initial slope of the normalised ΔC versus the normalised T_c curve has a maximum value of 3.638, which is the highest value reported in the literature for the impurity problem. The tunneling study suggests that for an electron-tunnelling search of bound states in alloys with relatively large Γ, an ultra-low temperature experiment is desirable. (17 refs.)

119748 Superconducting T_c for the separable model of (ϵ,ϵ') variation in $\alpha^2F(\epsilon,\epsilon';\Omega)$. B.Mitrovic (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA), J.P.Carbotte.
Phys. Rev. B (USA), vol.28, no.5, p.2477-84 (1 Sept. 1983).
The authors have derived and numerically solved a set of equations for the superconducting critical temperature T_c in the case of the separable model of electronic energy dependence in the electron-phonon coupling function $\alpha^2F(\epsilon,\epsilon';\Omega)=[1+a(\epsilon)]\alpha^2(\Omega)F(\Omega)[1+a(\epsilon')]$ analogous to the well-known separable model for anisotropy in α^2F. It is shown that to a good approximation the (ϵ,ϵ') dependence of α^2F can be ignored in calculating T_c provided the electronic density of states $N(\epsilon)$ is replaced by $N(\epsilon)[1+a(\epsilon)]^2$. They also consider the effect of scattering by normal impurities. This scattering effectively smears out the (ϵ,ϵ') dependence of α^2F which is analogous to the smearing of the structure in $N(\epsilon)$ by impurity scattering. (18 refs.)

119749 The effect of atomic order on the superconducting properties of A-15 Nb_3Au and $Nb_3Au_{1-x}Pt_x$ alloys. M.S.Wire, G.W.Webb (Inst. for Pure & Appl. Phys. Sci., Univ. of California, San Diego, La Jolla, CA, USA), D.E.Cox, C.L.Snead,Jr., A.R.Sweedler.
Solid State Commun. (USA), vol.48, no.2, p.125-7 (Oct. 1983).
The superconducting transition temperature, T_c, of pseudobinary A-15 $Nb_3Au_{1-x}Pt_x$ exhibits a broad maximum at $x=0.3$. Since the T_c of Nb_3Pt is known to be strongly dependent on atomic order, the authors have measured the long range order parameter of $Nb_3Au_{1-x}Pt_x$ alloys by X-ray diffraction techniques. They found these alloys to be almost fully ordered. They also investigated the effects of reactor-spectrum neutron irradiation on the T_c of Nb_3Au. As in the case of Nb_3Pt, T_c of Nb_3Au is strongly depressed with respect to the unirradiated value of 11K. They conclude that the peak of T_c in the $Nb_3Au_{1-x}Pt_x$ system cannot be explained on the basis of atomic ordering. (21 refs.)

119750 Critical temperature and density of states in amorphous $Zr_{70}Cu_{30}$. L.Civale, F.de la Cruz, J.Luzuriaga (Centro Atomico Bariloche, Bariloche, Argentina).
Solid State Commun. (USA), vol.48, no.4, p.389-91 (Oct. 1983).
By means of thermal heat treatment of amorphous $Zr_{70}Cr_{30}$ it is shown that the induced decrease in critical temperature is followed by a reduction in the electronic density of states of the same magnitude as that obtained by changing the Cu concentration. This result indicates that the density of states is the fundamental microscopic parameter determining the superconducting behavior. (14 refs.)

119751 Instabilities in the superconductivity and the resistivity of implanted $Pd_{1-y}Cu_yH_x$ thin layers. H.Wagner (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.47-55 (1983). In German.
The behaviour of resistivity and of superconductivity of thin PdCu alloy layers implanted with 10 keV hydrogen ions at liquid helium temperatures has been investigated. Critical transition temperatures of $T_c \leq 11.6K$ were reached. Layers with copper concentrations >40% exhibited lattice instabilities at large hydrogen concentrations. From the reversible and current dependent behaviour of the resistivity and of T_c it can be concluded that the lattice instability is connected with hydrogen outgassing from the lattice. Onset and intensity of outgassing are considerably affected by small temperature changes. The influence of the temperature and that of the radiation-induced lattice defects on the instability is discussed. (15 refs.)

74.20 THEORY

119752 Current-carrying states in superconducting channels with nonhomogeneities. B.I.Ivlev, N.B.Kopnin, I.A.Larkin (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., Moscow, USSR).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.153-76 (Oct. 1983).
The stability of a current-carrying normal state in a superconducting channel with nonhomogeneities is considered at $T<T_c$. A value of the current is found below which the normal state becomes absolutely unstable with respect to nucleation and growth of a superconducting domain. Furthermore, the superconducting state appearing near a nonhomogeneity characterized by a critical temperature T_{c1} higher than the critical temperature T_c of the main material is studied for the case of $T>T_c$. (17 refs.)

119753 Excitonic superconductivity—the missing link. W.A.Little (Phys. Dept., Stanford Univ., Stanford, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.819-25 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors discuss the factors which determine the strength of the excitonic coupling constant and show that, in general, it will be small. However, they show that by proper choice of the system and its energy levels, strong coupling should be possible. In this case superconductivity at higher temperatures should occur. (17 refs.)

119754 Generation of charge imbalance in a superconductor by non-uniform temperature gradient. B.A.Mattoo, Y.Singh (Dept. of Phys., Univ. of Kashmir, Srinagar, India).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.51-6 (July 1983).
Using a generalized two fluid picture for the charge of a superconductor the authors study the creation of charge imbalance due to non-uniform temperature gradient. They compare their results with those obtained by other techniques. (10 refs.)

119755 Two-dimensional superconductors. Evidence of Coulomb-gas scaling. P.Minnhagen (Dept. of Theoretical Phys., Lund Univ., Lund, Sweden).
Phys. Rev. B (USA), vol.28, no.5, p.2463-7 (1 Sept. 1983).
Recent data for the *I-V* characteristics of thin high-sheet-resistance Hg-Xe alloy films are analyzed. It is found that the Coulomb-gas scaling is borne out to an excellent degree. This gives clear evidence that the observed nonlinear *I-V* characteristics and the resistive tail are caused by vortex fluctuations. (21 refs.)

74.30 GENERAL PROPERTIES

119756 Low field ESR in the superconducting relaxed state of $(TMTSF)_2ClO_4$ at low temperature. J.M.Delrieu, N.S.Sullivan, K.Bechgaard.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1033-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present the first observation of the conduction electron paramagnetic resonance in the mixed superconducting state of $(TMTSF)_2ClO_4$. (9 refs.)

119757 High field magnetoresistance measurements of $(TMTSF)_2ClO_4$. R.Brusetti, K.Bechgaard (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), G.G.Lonzarich, R.H.Friend.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1055-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors report measurements of the magnetoresistance of $(TMTSF)_2ClO_4$ in the temperature range 0.3-1K and with fields up to 110 kG. They observe oscillations above a field H_t which depends on temperature. The frequencies of the oscillations and the magnetoresistance anisotropy are also field and

temperature dependent, which supports the picture of a field-induced transition to a semimetallic SDW phase. (9 refs.)

119758 Magnetoresistance of $(TMTSF)_2ClO_4$. K.Kajimura, H.Tokumoto, M.Tokumoto, K.Murata, T.Ukachi, H.Anzai, T.Ishiguro (Electrotech. Lab., Ibaraki, Japan), G.Saito.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1059-62 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Transverse magnetoresistance of $(TMTSF)_2ClO_4$ was found to exhibit Shubnikov-de Haas-type oscillation whose fields were strongly temperature dependent. The oscillation had no periodicity in the inverse field and exhibited a clear hysteresis around 90 kOe. These experimental facts suggest that there are closed orbits on the Fermi surface and energy band structures are altered by the magnetic field. (15 refs.)

74.30C Magnetization curves, Meissner effect, penetration depth

119759 Anisotropy of the Meissner effect and the diamagnetic shielding in $(TMTSF)_2ClO_4$. D.Mailly, M.Ribault, K.Bechgaard (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1037-40 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have measured the magnetic properties of $(TMTSF)_2ClO_4$ at low temperature. The critical fields H_{C1} and the Meissner signal show the anisotropy of the tridimensional coupling of the superconductivity. (16 refs.)

119760 Diamagnetic anisotropy, isotope shift and cooling-speed effects in superconducting $(TMTSF)_2ClO_4$ crystals. H.Schwenk, K.Andres (ZTTF, Garching, Germany), F.Wudl, E.Aharon-Shalom.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1041-5 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
For fields along the a-axis the low field diamagnetic shielding signals are strongly dependent on the thickness (b* and c* dimensions) of the crystals, which the authors explain by a macroscopically large London penetration depth for this orientation. The Meissner effect for fields in the b*/c* plane is strongly anisotropic. They further discuss the isotope shift between deuterated and non-deuterated crystals, the dependence of their superconductivity on the cooling speed, and their remarkable twinning properties at room temperature. (10 refs.)

74.30E Thermodynamic properties; thermal conductivity

119761 Quenched and relaxed low temperature states in $(TMTSF)_2ClO_4$. P.Garoche, R.Brusetti, K.Bechgaard (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1047-50 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Specific heat measurements on $(TMTSF)_2ClO_4$ demonstrate that the superconducting state is strongly distabilized when the sample is quenched from 40K. The relaxed state can be restored by annealing. The data show that, in the quenched state at OK, the superconducting phase is mixed with a semimetallic magnetic phase. (10 refs.)

119762 The magnetic field dependence of the specific heat in $(TMTSF)_2ClO_4$. R.Brusetti, P.Garoche, K.Bechgaard (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1051-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have measured the specific heat of $(TMTSF)_2ClO_4$ between 0.2K and 2K in magnetic fields ($H \lesssim 63$ kOe) parallel to c*. The field strongly affects the electronic contribution γT and the results show that two competing mechanisms are involved: increasing the field yields a strong first increase of γ, it is followed by a decrease of γ which announces and anticipates the condensation of a non-metallic ground state. (13 refs.)

119763 Characteristics of the specific heat of superconducting Laves phases ZrV_2 and HfV_2. I.E.Bulakh, A.M.Gabovich, A.E.Morozovskii, V.M.Pan, A.S.Shpigel' (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.504-5 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.880-2 (March 1983). [received: Oct. 1983]
The authors have determined the specific heat $C_p(T)$ of ZrV_2 and HfV_2 and paid special attention to the nature of the anomalies of these curves near the critical temperature T_c of the superconducting transition. The need for a detailed study of the behavior of the specific heat in the vicinity of T_c arises from the predicted reduction in the specific heat discontinuity $\Delta C_p(Tc)$ of systems with partial 'dielectrization' of the electron spectrum. (7 refs.)

74.30G Response to electromagnetic fields, nuclear magnetic resonance, ultrasonic attenuation

119764 Quantum oscillations of the ultrasound attenuation in bismuth. J.Dominec (Inst. of Phys., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.333-6 (1983).
The attenuation of ultrasound waves was measured for the wave vector along the trigonal axis. The magnetic field was also applied in this direction. The oscillations of the attenuation of longitudinal waves are attributed to hole levels, the oscillations of shear waves to electron levels. This phenomenon is explained on the basis of the theory of Mase et al. (1981). (6 refs.)

119765 A magnetic state in the organic superconductor $(TMTSF)_2ClO_4$: cooling rate and strong magnetic field effects. T.Takahashi, D.Jerome, K.Bechgaard (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.805-11 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
^1H and ^{77}Se-NMR on an oriented single crystal of the organic superconductor $(TMTSF)_2ClO_4$ reveal that a magnetic state is stabilized by two different ways. One is the introduction of anion disorder by rapid cooling of the crystal (O-state): a cooling rate of about 2K/sec gives an almost field-independent magnetic transition at about 3.7K. In a slowly cooled sample (cooling rate $\lesssim 0.2$K/min, R-state), a strong magnetic field induces a magnetic state below 2.15K at 74 kOe. This state corresponds to the field induced semi-metallic phase observed by specific heat and Shubnikov-de Haas measurements. (26 refs.)

119766 Response of an organic superconductor to an electromagnetic field. G.C.Psaltakis, E.W.Fenton (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1125-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The response to a transverse vector potential $A(q,\omega)$ of superconductivity, spin-density-wave (SDW) and SDW-superconductivity coexistence state has been calculated. The predictions are expected to be relevant to far-infrared optical measurements on $(TMTSF)_2X$. (8 refs.)

74.40 FLUCTUATIONS AND CRITICAL EFFECTS

119767 Normal zone propagation within a superconducting magnetic system and cryostabilization of superconductivity. I.N.Nechiporenko (Acad. of Sci., Kharkov, Ukrainian SSR).
Cryogenics (GB), vol.23, no.10, p.549-53 (Oct. 1983).
A theoretical study of normal zone propagation along composite conductors in contact with liquid helium which accounts for the resulting rate of heat release and non-uniformity of heat conduction coefficient is described. The Maddock-James-Norris theorem is shown to be true only for a constant heat conduction coefficient. The formulae are given for the speed of the normal zone propagation. Equations have been obtained which describe the collapse dynamics or normal zone growth within the superconducting magnetic systems; time of collapse and normal zone growth being evaluated. Nonlinear heat waves of a new type are assumed to exist in a composite in addition to the solution with an interface of normal and superconducting regions. (16 refs.)

119768 Superconductivity and anomalous magnetotransport in $(TMTSF)_2ClO_4$. P.M.Chaikin, Mu-Yong Choi (Dept. of Phys., Univ. of California, Los Angeles, CA, USA), R.L.Greene.
J. Phys. Colloq. (France), vol.44, no.C-3, p.783-90 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The band structure parameters of $(TMTSF)_2ClO_4$ as measured in many experiments and as recent calculated suggest that the material can be viewed as one, two or three dimensional depending on the temperature range and the criteria used. The authors show that the superconductivity only occurs as a three-dimensional phenomena and that 1-dim high temperature superconducting fluctuations are inconsistent with a wide variety of experiments. They also discuss the magnetoresistance and magnetothermopower. Below ~30K the magnetotransport coefficients become larger and at low temperature quantum oscillations are observed above a threshold field. It is suggested that the threshold field for the oscillations is related to a crossover from quasi-three-dimensional to quasi-twodimensional behavior when $\hbar w_c \rangle 4t_c$, the bandwidth in the direction parallel to the magnetic field. (41 refs.)

Magnetoresistance of $(TMTSF)_2ClO_4$ .... See Entry 119758

74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

119769 Nonlinear behaviour of Josephson junction PLL analog. Z.J.Kowalik (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.357-9 (Sept. 1983).
The Josephson junction model (PLL) was investigated. Universal properties of the model, characteristic for a wide class of dissipative systems, i.e. bifurcations, intermittency, etc. were observed. (12 refs.)

119770 Fabrication of A15 Nb_3Al Josephson tunnel junction using CF_4 cleaning process. Y.Katoh, K.Tanabe, O.Michikami (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L464-6 (July 1983).
A15 Nb_3Al thin-film Josephson tunnel junctions having an oxide barrier and a Pb counterelectrode have been fabricated by photolithogrpahy. Nb_3Al junction characteristics have been found to be drastically influenced by pre-cleaning conditions. Excellent junction qualities with low leakage current were achieved by adopting RF sputter-etching in $Ar+CF_4$ plasma as a pre-cleaning technique, instead of conventional Ar plasma. The chemical reaction of CF_4 radicals has been found to provide great utility for obtaining high quality tunnel junctions of an A15 Nb_3Al compound with a very short coherence length. (13 refs.)

119771 Anomalous microwave induced step behaviour in Josephson tunnel junctions. A.K.Gupta, V.S.Tomar, N.D.Kataria, M.P.S.Chauhan (Nat. Phys. Lab., New Delhi, India).
Indian J. Cryog., vol.8, no.2, p.81-5 (1983).
Lead-lead oxide-lead Josephson tunnel junctions are prepared in cross type geometry by deposition of lead films by thermal evaporation and by growing a suitable barrier by thermally oxidizing the surface of these films. The junctions are completed by depositing another film at right angles at the centre of the above film. These junctions have a reasonable pair current and show nearly ideal switching to energy gap in their I-V curves. However, they show some excess current below the gap region. The junctions when irradiated with microwaves show usual microwave induced constant voltage steps only at selected bands of microwave power levels. However, at power levels where amplitude of the zero voltage pair current approaches zero, the junction I-V characteristic shows negative differential resistance in their zeroth step. The magnitude of the negative swing changes systematically with the applied microwave power. The variation in the amplitude of the zeroth step with the square root of the microwave power does not strictly follow the Bessel function behaviour, but instead shows effects due to microwave induced excess currents. The overall behaviour is attributed to the growth of the nonequilibrium superconducting state. (14 refs.)

119772 Lifetime broadening effects in normal and superconducting states of A-15 materials. M.N.Mukherjee (Phys. Dept., Vidyasagar Coll., Calcutta, India), K.Pal.
Indian J. Cryog., vol.8, no.2, p.108-10 (1983).
Principal aspects of lifetime-broadening effects in A-15 superconducting materials are discussed. A method is suggested for the estimation of quasiparticle scattering rate in the superconducting state with a view to ascertaining the nature of the temperature dependence of quasiparticle lifetime. (11 refs.)

119773 Flux trapping in Josephson tunnel junctions. N.Uchida, K.Enpuku, Y.Matsugaki, S.Tomita, F.Irie (Dept. of Electronics, Kyushu Univ., Fukuoka, Japan), K.Yoshida.
J. Appl. Phys. (USA), vol.54, no.9, p.5287-92 (Sept. 1983).
Effects of flux trapping in the electrodes of Josephson tunnel junctions on junction characteristics are studied experimentally in the case of the field-cooling process. The suppression of the critical current and the increase of the quasiparticle current of the junction due to the trapped flux are measured. From the increase of the quasiparticle current, the amount of the flux trapped in junction electrodes is evaluated. The obtained amount of the trapped flux is discussed quantitatively on the basis of the pinning theory of nonideal type II superconductors, which gives the parameter of the electrodes characterizing the flux trapping. The relation between the amount of the suppression of the critical current and that of the trapped flux estimated from the quasiparticle current is studied quantitatively. It is shown that each trapped flux quantum suppresses the critical current of the junction by the ratio of about $\pi(6\lambda_L)^2/A$, where λ_L is the London penetration depth and A is the junction area. (23 refs.)

119774 Noise and the superconducting transition in self-heated tunnel junctions. T.A.Will, J.G.Adler (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.23-40 (Oct. 1983).
Distinctive structure in the tunneling characteristics of junctions having a superconducting electrode arises at a bias V_0 where junction dissipation is sufficient to drive the electrode normal. While details of this structure are dependent upon junction-bath thermal linkage, in all cases a marked increase of junction conductance $\sigma(V)=dI/dV$ occurs at V_0 and this increase reflects an excess current at the superconducting-normal phase transition. In the case of Pb electrode junctions the transition in both normal and superfluid He occurs when junction dissipation triggers film boiling in the liquid. The authors discuss phase transition-induced tunneling structure, junction noise, and excess current for Pb electrode junctions in different thermal environments and consider the implications for tunneling spectroscopy and Josephson device applications. (24 refs.)

119775 Tunneling in organic superconductors. A.Fournel, C.More, G.Roger, J.P.Sorbier, C.Blanc (Dept. d'Electronique, Univ. de Provence, Marseille, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.879-84 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present results obtained with tunnelling devices using the organic materials, $(TMTSF_2)PF_6$ and $(TMTSF)_2ClO_4$. The cooling rate has an effect on the appearance of the SDW state. In the relaxed state a modification of the density of states near 20K is observed. (8 refs.)

119776 High-resolution imaging of inhomogeneities in superconducting tunnel junctions by scanning with a modulated electron beam. H.Seifert, R.P.Huebener (Phys. Inst. II, Univ. Tubingen, Tubingen, Germany), P.W.Epperlein.
Phys. Lett. A (Netherlands), vol.97A, no.9, p.421-3 (26 Sept. 1983).
A two-dimensional image of spatial structures within a superconducting tunnel junction can be obtained by scanning the current-biased junction with an electron beam and detecting the voltage change. The resolution of this imaging technique is governed by the thermal-healing length which describes the spatial diffusion of the beam energy through the superconducting film. Due to the thermal skin effect this resolution can be improved remarkably by high-frequency modulation of the beam intensity and synchronous signal detection. (5 refs.)

119777 Theory of the Josephson effect in superconducting contacts at high voltages. A.V.Zaitsev (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.534-5 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.927-9 (March 1983). [received: Oct. 1983]
The author examines the nonsteady effect in superconducting contacts with constrictions at voltages $V\gg\Delta$ (V is assumed to be constant or to vary only slightly in a time of the order of Δ^{-1}). He considers the case of 'pure' constrictions whose characteristic dimension $a \ll l$, where l is the mean free path. (4 refs.)

119778 Random instability in Josephson junctions. V.N.Gubankov, K.I.Konstantinyan, V.P.Koshelets, G.A.Ovsyannikov (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.574-5 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1332-5 (Nov. 1982). [received: Sept. 1983]
The authors report the experimental observation and study of random oscillations in a Josephson junction with a voltage-current characteristic exhibiting hysteresis during the application of external microwave power. (9 refs.)

119779 Investigations on the structure of Nb-NbO_xPb-Josephson tunnel junctions. H.-J.Kohler, P.Seidel, P.Weber, K.Bluthner, S.Linke, T.Hadrich, K.-H.Berthel (Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.7-17 (1983). In German.
Nb-NbO_x-Pb tunnel junctions with tunnel areas of 100×100 μm^2 to 3×3 μm^2 are investigated. The temperature dependence of the current voltage characteristic, of the effective niobium energy gap and of the critical Josephson current are compared with the BCS curves. The deviation of the experimentally determined values is caused by a proximity effect model the parameters of this proximity layer can be found by fitting the calculated values to the experimental values. Moreover current density distributions in tunnel junctions are determined, which can be calculated from the dependence of the critical Josephson current on the magnetic field by means of a theoretical model. The dependences of the current density distributions on tunnel areas and the changes in time are investigated. (16 refs.)

119780 Adiabatic perturbation theory for external and mutual synchronization of Josephson elements. W.Krech (Sektion Phys., Freidrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.19-24 (1983). In German.
The author investigates the synchronization behaviour of a resistively shunted de-biased ($I>i_c$) Josephson element caused by a small AC signal. After variation of the constant phase in the autonomous solution and an adiabatic averaging procedure they derive equations for the slowly varying Josephson generation phase in arbitrary order of the signal amplitude. To the first order, the method is applied to determine the relative phase of two Josephson junctions in the case of SQUID coupling and parallel biasing. (8 refs.)

119781 The delay time in changeover switching from the superconducting to the normal-conducting state in In-Pb-In thin-film bridges. W.-D.Schmidt (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.25-30 (1983). In German.
The time delay until the occurrence of normal state conductivity of superconducting thin film bridges was investigated by means of two pulse-measuring methods. The results could be explained very well by a time-dependent Ginzburg-Landau model. The obtained relaxation time of the In-Pb-In thin-film system was of the order of 3ns. (11 refs.)

119782 Investigations of the current-induced resistive behaviour in long microbridges. H.Frohlich.
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.39-46 (1983). In German.
The current-induced resistive state in long superconducting microbridges over the transport current interval $0.5\ I_c<I<0.7\ I_c$ is determined by flux flow. Above this interval ohmic losses predominate. By means of this model the noise dependence of the transport current can be explained. (9 refs.)

Some properties of superconducting virtual-bound-state alloys .... See Entry 119747

74.60 TYPE-II SUPERCONDUCTIVITY

119783 Resonant drag of a type II superconductor cylinder by oscillating Abrikosov vortices. D.G.Driyaev, Dzh.G.Chigvinadze (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.509 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.887-8 (March 1983). [received: Oct. 1983]
If a cylindrical sample of a type II superconductor is suspended by an elastic filament and subjected to a magnetic field H exceeding the first critical value H_{c1} (but below the second critical value H_{c2}), such a cylinder becomes penetrated by the Abrikosov vortex line (fluxoids) and one magnetic flux quantum penetrates along each line into the sample. Such vortices influence the magnetic properties of the suspended system so that they can be investigated by mechanical methods. The authors have investigated the possibility of drag of the crystal lattice of such a sample by moving Abrikosov vortices. (3 refs.)

Lifetime broadening effects in normal and superconducting states of A-15 materials .... See Entry 119772

74.60E Mixed state, H_{c2}, surface sheath

119784 Ultrasonic study of niobium in longitudinal magnetic fields. K.Misek (Dept. of Low Temperatures, Inst. of Phys., Praha, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.321-31 (1983).
Several types of hysteresis of ultrasound attentuation in niobium single crystals during transitions from the normal to the mixed state and from the mixed state to the superconducting state in longitudinal magnetic fields at 4.2K were observed. The lower critical field H_{c1} and the hysteresis near to it are structure sensitive. A qualitative discussion of the observed phenomena is given. (14 refs.)

119785 Note on upper critical field of heavy fermion superconductivity. K.Machida (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2979-80 (Sept. 1983).
Effects of Fermi liquid parameters on the upper critical field H_{c2} are discussed theoretically. The Maki parameter which characterizes behavior of H_{c2} in the presence of the Pauli paramagnetic effect is found to be renormalized by electron-electron interaction. Experimental data on a 'heavy Fermion' superconductor $CeCu_2Si_2$ are analyzed. (6 refs.)

119786 Magnetoresistance and critical field measurements on the magnetic superconductor Y_4Co_3. C.Sulkowski, K.Rogacki (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wroclaw, Poland), A.Kolodziejczyk, G.Kozlowski, J.Chmist.
J. Phys. F (GB), vol.13, no.10, p.2147-53 (Oct. 1983).
The resistance and magnetoresistance of the intermetallic magnetic superconductor Y_4Co_3 were measured in the temperature range 1.74-4.2K and in fields of up to 1.1 T. The authors extracted the slope of the upper critical field near the superconducting transition, and the specific heat coefficient γ. The main conclusions are that the superconducting state is fully quenched just above the transition temperature, and that the authors are dealing with a dirty superconductor. Moreover, the specific heat coefficient γ calculated from theory is in good agreement with the experimental value. (18 refs.)

119787 Superconductivity?. M.Ribault (Lab. de Phys. des Solides, Univ. de Paris Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.827-30 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The author discusses the physical parameters identifying the superconducting ground state particularly the critical fields before giving new results on the quenched state of $(TMTSF)_2ClO_4$. A cooling rate of 4K/s leads to a low electrical conductivity material whereas a cooling rate of 10^{-3}K/s leads to a superconductor, width of the transition is then lower than 0.15K. (16 refs.)

119788 Upper critical fields of regular superconductive networks. Surfaces and impurities. J.M.Simonin, C.Wiecko, A.Lopez (Centro Atomico Bariloche, Comision Nacional de Energia Atomica, Bariloche, Argentina).
Phys. Rev. B (USA), vol.28, no.5, p.2497-504 (1 Sept. 1983).
The upper critical field of several defect structures is studied using the de Gennes-Alexander theory of superconductive networks. The systems considered include a terminated ladder, an impurity site within the ladder, and a square lattice with a surface. Localised modes of condensation appear in all the structures considered. Four different methods have been used alternatively or concurrently: direct diagonalisation, continuous-fraction expansion, transfer matrix, and a renormalisation-group decimation procedure. This last method has proved very useful to study irrational values of the ratio flux to flux quantum in the square lattice. The case of the square lattice with a surface shows several characteristics in common with surface superconductivity (H_{c3}) in bulk materials. (9 refs.)

119789 Mixed state of the layered metals. B.Ya.Shapiro (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).
Solid State Commun. (USA), vol.48, no.4, p.365-7 (Oct. 1983).
The theory of mixed state of the layered metals is presented. It is shown that the lattices of the superconductive states localized along the magnetic field arise in the layered metals systems. The magnetic moment, structure and energy of the lattices of the superconductive states are determined. (16 refs.)

74.60G Flux pinning; fluxon-defect interactions

119790 Quasiclassical theory of the elementary pinning potential of a vortex line to a small defect in a type II superconductor. J.Kurkijarvi, D.Rainer, E.V.Thuneberg.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.86-9 (1983).
Flux pinning is studied by the quasiclassical method. The authors give results on a quasiparticle scattering mechanism of elementary pinning which outweighs the traditional excluded volume effect by the factor coherence length divided by the spatial extent of the pinning center. (10 refs.)

119791 Fluxoid motion and electromagnetic phenomena of a superconductor in a longitudinal magnetic field. T.Matsushita, Y.Hasegawa, J.Miyake (Dept. of Electronics, Kyushu Univ., Fukuoka, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.5277-81 (Sept. 1983).
The fluxoid motion during the process of applying the transport current to a superconductor in the longitudinal field configuration is visualized by solving the continuity equation of the fluxoid number. In this configuration, the force-free state described by rot $\mathbf{B}=\alpha\mathbf{B}$ is assumed. The obtained fluxoid velocity $\mathbf{v}$ contains the torsionally shearing component. The well-known relation $\mathbf{E}=\mathbf{B}\times\mathbf{v}$ does not hold in the present field configuration. This fluxoid motion and the related phenomena are compared with those in the rotating transverse field configuration. (16 refs.)

119792 Computer simulation of vortex pinning in type II superconductors. I. Two-dimensional simulation. E.H.Brandt (Inst. fur Phys., Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.41-70 (Oct. 1983).
The summation of pinning forces to a volume exerted on the vortex lattice in type II superconductors allowing it to carry a loss-free current is not fully understood. In order to clarify this question the author started computer simulations of flux pinning. It is shown that for many experimental situations bending of vortices may be neglected since the vortices are too short or pinning is too weak, and thus pinning is two-dimensional. As a first step, two-dimensional pinning simulations will thus be instructive with regard to, say, ribbons of amorphous metals. A general expression for the energy of a vortex-pin system in two and three dimensions is given. The simulation method is presented and illustrated for the isolated pin (with a detailed discussion of the 'threshold effect' and of elastic instabilities) and for pin 'walls' (grain boundaries) and 'nozzles'. (52 refs.)

119793 Computer simulation of vortex pinning in type II superconductors. II. Random point pins. E.H.Brandt (Inst. fur Phys., Max-Plank-Inst. fur Metallforschung, Stuttgart, Germany).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.71-152 (Oct. 1983).
For pt.I see ibid., vol.53, nos.1/2, p.41 (1983). Pinning of vortices in a type II superconductor by randomly positioned identical point pins is simulated using the two-dimensional method. The system is characterized by the vortex and pin numbers (N_v,N_p), the vortex and pin interaction ranges (R_v, R_p), and the amplitude of the pin potential A_p. The computation is performed for many cases: dilute or dense, sharp or soft, attractive or repulsive, weak or strong pins, and ideal or amorphous vortex lattice. The total pinning force F as a function of the mean vortex displacement X increases first linearly (over a distance usually much smaller than the vortex spacing and than R_p) and then saturates, fluctuating about its average $\bar{F}$. $\bar{F}$ is interpreted as the maximum pinning force j_cB of a large specimen. For weak pins the prediction of Larkin and Ovchinnikov (1979) for two-dimensional collective pinnings is confirmed: $\bar{F}=$ const.$\bar{W}/R_pc_{66}$, where $\bar{W}$ is the mean square pinning force and c_{66} is the shear modulus of the vortex lattice. If the initial vortex lattice is chosen highly defective ('amorphous') the constant is 1.3-3 times larger than for the ideal triangular lattice. This finding may explain the often observed 'history effect'. The function $\bar{F}(A_p)$ exhibits a jump, which for dilute, sharp, attractive pins occurs close to the 'threshold value' predicted for isolated pins by Labusch (1969). (13 refs.)

119794 Flux-line instability in a superconducting wire with longitudinal current. Z.Przelozny (Inst. of Nuclear Phys., Acad. of Mining & Metall., Krakow, Poland).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.44-6 (3 Oct. 1983).
The vortex lattice in a type II superconducting wire is unstable to the growth of helical deformation if the current along the vortices exceeds a critical value. The critical current is obtained by pinning or by the shear stiffness in a pure sample. The dependence of critical current on the external magnetic field, exhibits a peak in a field close to H_{c2}. (4 refs.)

119795 On the flux jumps in hard superconductors. J.Sosnowski (LMSES CNRS, Inst. de Phys., Univ. Louis Pasteur, Strasbourg, France).
Phys. Status Solidi a (Germany), vol.79, no.1, p.207-12 (Sept. 1983).
The results of the calculations of the higher stability limits appearing after the successive flux jumps are presented. The solutions of the recurrence equations for two kinds of relations between the flux jump field and stability-limited field are given. In the first case, in which all instabilities develop into the flux jumps, the periodicity of the successive flux jumps is predicted, while in the second, in which the flux jump field is proportional to the stability-limit field, the distance between flux jumps is described by geometrical progress. (10 refs.)

119796 Role of grain boundaries in the trapping of a magnetic flux and in the change of plasticity during a superconducting-normal transition. V.V.Pustovalov, V.A.Sirenko, V.S.Fomenko (Physicotech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.496-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.867-9 (March 1983). [received: Oct. 1983]
The authors have investigated the change in the trapped magnetic flux B_0 with the deformation of single-crystal and polycrystalline Pb-In alloys in a wide range of indium concentrations (0-30 at.% In). The same experiments established the influence of grain boundaries on the change in the plasticity as a result of the superconducting-normal transition, which was important for the understanding of the nature of such changes. (3 refs.)

119798 Magnetism of the heavy 5f elements. P.G.Huray, S.E.Nave (Dept. of Phys., Univ. of Tennessee, Knoxville, TN, USA), R.G.Haire.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.293-300 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Magnetic properties of the trivalent lanthanide ions have been classically used to demonstrate the applicability of L-S coupling and Hund's rule to the 4f element series. An examination of similar behavior for the more spatially extended orbitals of the 5f element series has, until the last few years, been limited to lighter members (actinium through americium). Characterization of magnetic properties of heavier ions (curium, berkelium, californium and einsteinium) has recently led to a comparison with the 4f ion homologues of the actinides and to an extension of the test of L-S coupling to a new region of the periodic table. Investigations of the magnetic properties of heavy element compounds and metals have additionally led to some unexpected results which suggest a rich structure of low temperature magnetic ordering. The increasing degree of spatial localization of the heavy actinide orbitals thereby provides another vehicle for studying the theory of magnetic ordering via the conduction electrons. (16 refs.)

119799 A Monte Carlo study of the three-states antiferromagnetic Potts model in two dimensions. F.Fucito (California Inst. of Technol., Pasadena, CA, USA).
J. Phys. A (GB), vol.16, no.14, p.L541-5 (1 Oct. 1983).
Using Monte Carlo methods the author studies the two-dimensional three-stages Potts model with antiferromagnetic nearest neighbours and ferromagnetic next-nearest neighbours couplings on a square lattice. The author focuses on the case with only antiferromagnetic coupling; from the analysis of the data gathered, there is evidence that this system shows critical behaviour only at $T=0$. (10 refs.)

119800 Diffusion coefficients of fluctuations in semi-infinite ferromagnets. W.Korneta (Dept. of Phys., Tech. Univ., Radom, Poland), Z.Pytel.
J. Phys. Lett. (France), vol.44, no.19, p.L811-16 (1 Oct. 1983).
The nearest-neighbour Ising model of a semi-infinite ferromagnet in which near-surface couplings may differ from their bulk values is considered. In the critical region near second-order phase transitions the decay of fluctuations of the magnetization density is described by a diffusion equation with a damping term. Using mean-field theory, the diffusion coefficients of fluctuations in the paramagnetic phase near the ordinary, surface-bulk and surface phase transitions are obtained and their dependence on the distance from the surface of the ferromagnet and on the temperature is discussed. (10 refs.)

119801 Digital dynamics and the simulation of magnetic systems. M.Y.Chaoi (Dept. of Appl. Phys., Stanford Univ., Stanford, CA, USA), B.A.Huberman.
Phys. Rev. B (USA), vol.28, no.5, p.2547-54 (1 Sept. 1983).
This paper investigates the problems associated with simulating many-body systems with finite-state machines such as computers. It is shown that the digital (discrete) character of time brings in features which are not encountered in the usual analytical studies using continuous time. This is illustrated with a thorough study of the dynamics of simple magnetic systems with competing interactions. Whereas continuous dynamics, as derived from the usual master-equation approach, yields asymptotic behaviour which is time independent, dynamics in digital time can led to complex behaviour characterized by the existence of multiple basins of attraction, broken symmetries, oscillations, and chaos. These results might provide a dynamical explanation for the breakdown of erogodicity which has been reported in Monte Carlo studies of spin-glasses. (23 refs.)

119802 Surface tension, roughening, and lower critical dimension in the random-field Ising model. G.Grinstein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), Shang-keng Ma.
Phys. Rev. B (USA), vol.28, no.5, p.2588-601 (1 Sept. 1983).
A continuum intertace model is constructed to study the low-temperature properties of domain walls in the random-field Ising model (RFIM). The width of the domain wall and its surface tension are computed by three methods: simple energy accounting, dimensional arguments, and approximate renormalization-group calculations. All methods yield a surface tension which is positive at sufficiently low temperature for small random fields, h, provided that the dimensionality $d>2$. The lower critical dimension of the RFIM is thus argued to be 2. While effects due to discreteness of a lattice are argued to alter some of the continuum results quantitatively, they do not change these central conclusions. For $d<2$ the ferromagnetic correlation length of the RFIM behaves like $1/(h^{-2(-d)})$ as $h \rightarrow 0$. (35 refs.)

119803 Magnetic doublet states in quasi-1D tetracyanoquinodimethanides. L.Komorowski (Inst. of Organic & Phys. Chem., Tech. Univ. of Wroclaw, Wroclaw, Poland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1593-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A singlet-doublet-triplet model (SDT) has been proposed for the spin distribution in a quasi-1d chain of a complex ion-radical salt of TCNQ. Isolated $TCNQ^-$ radicals frozen within the chain by cooling have been identified as 'radical impurities' imminently present in these materials. (6 refs.)

119804 Correlation effects in band ferromagnets as detected by energy-and angle-resolved spin-polarized photoemission: Ni(110). R.Clauberg (Inst. fur Festkorperforschung, KFA, Julich GmbH, Julich, Germany).
Phys. Rev. B (USA), vol.28, no.5, p.2561-5 (1 Sept. 1983).
Calculated spectra of photoemission from Ni(110) with the use of a single-step model of the photoemission process and with the inclusion of self-energy corrections within the *t*-matrix approximation are compared to the results of a recent energy-, angle- and spin-resolved photoemssion experiment with linearly polarized light ($h\nu=16.85$ eV). The power of this technique to study electronic structure of correlated, magnetic solids is for the first time fully exploited. Good agreement is found not only in peak positions, but also in relative intensities as well as line shapes. In addition, evidence is provided that surface relaxation is important for the full understanding of the electronic structure of this particular crystal surface. (21 refs.)

119806 **Magnetic susceptibilities and the order parameters of some 4,4′-disubstituted biphenyl cyclohexanes.** H.J.Muller, W.Haase (Inst. fur Phys. Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany).

J. Phys. (France), vol.44, no.10, p.1209-13 (Oct. 1983).

The diamagnetic susceptibilities of some 4,4′-disubstituted biphenyl cyclohexanes are reported as a function of temperature. The order parameters of the uniaxial nematic, smectic A and smectic B phases are calculated. The effect of the terminal substituents and the central groups on the magnetic anisotropy and the order parameter is discussed. (21 refs.)

119807 **Diamagnetism of dilute acceptor compounds of graphite.** K.Matsubara, K.Kawamura, T.Tsuzuku (Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3180-7 (Sept. 1983).

Diagmagnetism study on graphite-acceptor compounds has been further extended over dilute nitrates and slightly neutron-irradiated graphite. An analysis was made on the basis of Sharma-Johnson-McClure's theory taking into account the trigonal warping of the Fermi surface. The susceptibility vs. reciprocal temperature plots, including those for IC*l* compounds not completely interpreted in the previous study, have been theoretically reproduced by assuming a mixed phase structure of orderly intercalated and purely graphitic domains in each sample. The hole production rate (ionization efficiency) of acceptors was evaluated by using Ono-Sugihara's formulae which takes into account the trigonal warping effect on the carrier density. It has been found that 5% of intercalated IC*l* is ionized in the doped regions irrespectively of the total content. (18 refs.)

119808 **Magnetic susceptibility of tetravalent curium compounds.** S.E.Nave (Dept. of Phys. & Aston., Univ. of Tennessee, Knoxville, TN, USA), R.G.Haire, P.G.Huray.

J. Less-Common Met. (Switzerland), vol.93, no.2, p.360 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given, as follows. A systematic magnetic study was carried out on the nominally $(5f)^6$ electronic configuration for curium in the compounds CmO_2, CmF_4, $BaCmO_3$ and $(Th,Cm)O_2$. The f^6 electronic configuration is predicted to have a zero paramagnetic effective moment by both simple *L-S* coupling and intermediate coupling models. However, the smallest moment that has been observed is 1.6 μ_B and was obtained for the oxide compounds CmO_2 and $BaCmO_3$. The moment appears to be dependent on the compound, with an even larger value for CmF_4. In all cases the non-zero moments are too large to be attributed to impurity content as ascertained by standard analytic techniques. The $(5f)^7$ configuration of trivalent curium has a moment measured to be very near that of 7.92 μ_B predicted by simple *L-S* coupling. This moment is so large that only about 4 at.% present in these nominally tetravalent compounds would give rise to the observed moment of 1.6 μ_B. Owing to the potential presence of trivalent curium, special attention has been given to minimizing its presence in the preparation of samples, to analytical techniques for detecting it and to assessment of its effect on the magnetic data. The $BaCmO_3$ compound was studied on the premise that it afforded maximum stabilization of the tetravalent state of curium. The study was also extended to curium doped (about 3 mol.%) into a ThO_2 matrix. This gave a non-magnetic matrix in which to observe the tetravalent state and served to determine the effect of Cm-Cm interactions. The lowest moment measured for a $(Th,Cm)O_2$ was 4 μ_B.

119809 **Magnetic behavior of Dy^{3+} ion in $Dy_2(SeO_4)_3.8H_2O$. Experimental and theoretical study including the effects of *J-J* mixing.** D.Neogy (Dept. of Phys., Burdwan Univ., Burdwan, India), J.Nandi.

J. Phys. & Chem. Solids (GB), vol.44, no.10, p.943-9 (1983).

Single crystals of dysprosium selenate octahydrate were grown and magnetic measurements carried out on the principal anisotropies and the principal susceptibility χ_1 at room temperature and their thermal variation down to 90K. The magnetic moment is found to be slightly lower than the free-ion value, although the anisotropy is quite high. The variation of the average moment with temperature is very small and a least squares fit to a Curie-Weiss law yielded -0.97K as the paramagnetic Curie temperature. An analysis of the data was undertaken on the basis of interaction of the rare ion with its immediate neighbors. A crystal field (CF) of tetragonal symmetry which is the approximate site symmetry of the RE^{3+} ion, gave an excellent simulation of the observed behavior. Considerable effects of *J-J* mixing of the first three *J*-multiplets with the ground one were noticed. *g*-factors and the Schottky anomalies in the heat capacity were determined theoretically. Various hyperfine properties, including the thermal variation of the Mossbauer spectra, were computed for both isotopes of dysprosium in the light of the proposed CF. (26 refs.)

119810 **Physical properties of the TMTTF salts and TMTSF/TMTTF alloys: competition between the stacks instabilities.** C.Coulon (Domaine Univ., Talence, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.885-92 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

The physical properties of the $(TMTTF)_2$ X salts and $[(TMTSF)_{1-x}(TMTTF)_x]_2ClO_4$ alloys are reviewed. The nature of the low temperature phase transitions is discussed in connection with the electronic properties at higher temperature and for $(TMTTF)_2$ SCN with the anion ordering. (21 refs.)

119811 **Magnetic sub-chain anisotropy in the crossing chain compound $HMM(TCNQ)_2$.** S.Oostra, R.J.J.Visser, G.A.Sawatzky (Lab. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands), C.F.Schwerdtfeger.

J. Phys. Colloq. (France), vol.44, no.C-3, p.1381-2 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

$HMM(TCNQ)_2$ is a compound with non-parallel TCNQ chains. Although the chains are identical this leads to very different susceptibilities for the non-parallel chains as observed by ESR, depending on their angle with respect to the direction of magnetic field. (3 refs.)

119812 **Magnetic susceptibility of the one-dimensional metal $Li_xPt(C_2S_2(CN)_2)_2$, $2H_2O$.** J.R.Cooper, M.Miljak, M.M.Ahmad, A.E.Underhill (Inst. of Phys. Univ., of Zagreb, Zagreb, Yugoslavia).

J. Phys. Colloq. (France), vol.44, no.C-3, p.1391-5 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).

Static susceptibility measurements are reported for the one-dimensional metal $Li_xPt(C_2S_2(CN)_2)_2$ from 2 to 300K. By comparing the present results with optical reflectivity data and conductivity data obtained by other groups it is concluded that the electron-electron Coulomb repulsion is small in this material. (12 refs.)

119813 **Magnetic properties of actinide elements having the $5f^6$ and $5f^7$ electronic configurations.** S.E.Nave (Dept. of Phys., Univ. of Tennessee, Knoxville, TN, USA), R.G.Haire, P.G.Huray.

Phys. Rev. B (USA), vol.28, no.5, p.2317-27 (1 Sept. 1983).

Magnetic susceptibility measurements have been made on multimicrogram quantities of $^{243}AmF_3$, $^{248}CmF_4$, $^{248}CmO_2$ and $^{248}CmBaO_3$ samples (nominally the $5f^6$ electronic configuration) and on $^{248}Cm_2O_3$, $^{248}CmF_3$, $^{249}BkF_4$ and $^{249}BkO_2$ (nominally the $5f^7$ electronic configuration) in the temperature range 4.2-300K and in magnetic fields up to 1650 G. The experimentally determined effective magnetic moments and the Curie-Weiss constants for these compounds are presented. The deviation of the moments for the $5f^6$ compounds from those expected from classic theory is discussed in terms of low-lying excited states, chemical composition, crystal-field perturbations and realistic electronic structure. (29 refs.)

119814 **Magnetic and thermal behavior of $NiSnCl_6.6H_2O$ at low temperatures.** D.L.Meier, M.Karnezos, S.A.Friedberg (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Phys. Rev. B (USA), vol.28, no.5, p.2668-76 (1 Sept. 1983).

$NiSnCl_6.6H_2O$ crystals have a trigonal structure containing one trigonally distorted $[Ni(H_2O)_6]^{2+}$ complex per unit cell. The authors have measured the magnetic susceptibilities $\chi_\parallel$ and $\chi_\perp$ and the heat capacity *Cp* of single-crystal specimens of this salt down to ~0.06K in a ^3He-^4He dilution refrigerator. The low- (zero-) field data are well described by a model in which the $^3A_{2g}$ ground state of $[Ni(H_2O)_6]^{2+}$ is split into a lower singlet separated from an excited doublet by $D/k=0.576$K, and significant antiferromagnetic interionic interactions exist which are too small relative to *D* to produce long-range spin order Using both simple mean-field and Oguchi approximations, they have determined the parameters *D*, $g(=2.24)$, and $zJ/k(=-0.044\text{K})$. Some anisotropy of the subcritical coupling constant, probably of dipolar origin, is inferred from the susceptibility results. Magnetocaloric effect and heat capacity were measured for single crystals with $\hat{H}$ parallel to the trigonal axis. Cooling by adiabatic magnetization, followed by level crossing at $H'_c=4100$ Oe, was observed. However, attempts to observe field-induced long-range spin ordering were not successful. (24 refs.)

119815 **Experimental observation of the diamagnetic susceptibility of gold in the temperature range 4-290K.** R.Plumier, M.Sougi, M.Lecomte (Service de Phys. du Solide et de Resonance Magnetique, CENS, Gif-sur-Yvette, France).

J. Phys. & Chem. Solids (GB), vol.44, no.10, p.1015-17 (1983).

High precision measurements of the diamagnetic susceptibility of gold have been performed in the temperature range 4-290K using a Setaram Faraday balance of 10^{-6}g sensitivity. The experiments are performed at four different magnetic field values H_i $(i=1,...4)=5.5$, 7.3, 9 and 10.3 kG. After subtraction of the contribution of the holder to the observed forces. (5 refs.)

119816 **The paramagnetic properties of Heusler alloys containing iron.** P.J.Webster (Dept. of Civil Engng., Univ. of Salford, Salford, England), K.R.A.Ziebeck.

Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.51-3 (3 Oct. 1983).

The paramagnetic properties of the two Heusler alloys Fe_2VAl and Fe_2VGa are shown to be non-Curie-Weiss, but to contain a Van Vleck contribution. Comparisons are made with related Heusler alloy series and current exchange theories. (11 refs.)

(see also 72.15Q Electronic conduction)

119817 Temperature-dependent susceptibility for the asymmetric Anderson model. N.Kawakami, A.Okiji (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.54-6 (3 Oct. 1983).
The temperature-dependent impurity susceptibility for the asymmetric Anderson model is calculated with the aid of the Bethe Ansatz method. The results show good agreement with those of the renormalization-group calculations. (11 refs.)

75.25 SPIN ARRANGEMENTS IN MAGNETICALLY ORDERED MATERIALS (NEUTRON STUDIES, ETC)

119818 Theoretical investigations of the dynamical neutron diffraction by magnetic single crystals. H.H.Schmidt (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.679-82 (1 Sept. 1983).
The fundamental equations for dynamical magnetic neutron diffraction including an external magnetic field are given. The reflecting power is calculated for some special cases for asymmetrical Laue geometry. Some Pendellosung effects are discussed. Analytical and numerical results for the integrated reflecting power are presented. (12 refs.)

119819 Experiments on dynamical magnetic neutron diffraction by $DyFeO_3$. H.H.Schmidt, K.Konig, H.Daniel (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.682-5 (1 Sept. 1983).
The integrated reflecting powers of two nuclear and one magnetic reflection of a $DyFeO_3$ crystal have been measured. The results indicate that dynamical magnetic diffraction occurs. In addition, the integrated reflecting power of the magnetic reflection was measured as a function of the magnetic field applied to the crystal. The results are discussed. (12 refs.)

119820 Neutron-scattering study of the randomly mixed antiferromagnet with competing anisotropies $K_2Co_xFe_{1-x}F_4$. W.A.H.M.Vlak (Netherlands Energy Res. Found. ECN, Petten, Netherlands), A.F.M.Arts, H.W.de Wijn.
J. Phys. C (GB), vol.16, no.28, p.L1015-20 (10 Oct. 1983).
The phase diagram of the two-dimensional (2D) randomly mixed antiferromagnet with orthogonal competing anisotropies $K_2Co_xFe_{1-x}F_4$ has been examined with elastic neutron scattering, in particular for $x=0.27$. For this composition the system supports long-range order of the axial spin components in 3D below a regular second-order transition at $T_N=64.4\pm0.6$K. The transverse components also order below T_N, but in 2D and over limited distances only. Below $T_L=27\pm2$K the transverse components acquire 3D order by reorientation, establishing an oblique antiferromagnetic phase in four domains. The lower transition is first order. (18 refs.)

119821 Magnetic, chemical and structural ordering in transition metals. V.Heine, J.H.Samson (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
J. Phys. F (GB), vol.13, no.10, p.2155-68 (Oct. 1983).
The metals in the middle of the transition metal series have a tendency towards antiferromagnetism, ordered AB alloy structures and lattice distortions based on a twofold superlattice. By contrast, at the beginning and end of the series the corresponding tendency is towards ferromagnetism, chemical segregation rather than alloy formation, and stable simple structures. The authors show how all these results can be understood in a unified way in terms of a general theorem published earlier. The argument applies quite generally to any set of tight-binding bands such as the d bands, independent of the specific structure. In a general sense the superlattice formation for approximately a half-filled band is like a Peierls transition, but it results from the electronic structure as a whole with no special role attached to the Fermi surface. The case of threefold superlattices is also discussed with examples. (39 refs.)

75.30 MAGNETICALLY ORDERED MATERIALS, OTHER INTRINSIC PROPERTIES

(for critical point effects, see 75.40)

75.30C Saturation moments and magnetic susceptibility

119822 Magnetic properties of $Cr_{1-x}Fe_xGe$. T.Sato, E.Ohta, M.Sakata (Dept. of Instrumentation Engng., Keio Univ., Yokohama, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3163-9 (Sept. 1983).
The magnetic susceptibility χ and the electrical resistivity ρ of $Cr_{1-x}Fe_xGe$ ($0\leq x\leq0.9$) are measured in the temperature ranges of 4.2-420K and 4.2-300K, respectively. The magnetic susceptibility shows the Curie-Weiss-like behavior in a composition region close to a critical composition for the onset of ferromagnetism ($x=0.75$). At high temperatures, the electrical resistivity shows a temperature dependence which is convex to temperature axis and finally tends to saturation for all the samples investigated. For small x, the electrical resistivity is proportional to T^2 at low temperatures. These behaviors of χ and ρ for $x>0$ are explained on the basis of the spin fluctuation theory for weakly and nearly ferromagnetic metals. The authors conclude that the degree of the electron correlation increases systematically with increasing x. (21 refs.)

119823 High-pressure synthesis and magnetic properties of the solid solution $MnCr_xSb$ and $CrMn_ySb$ ($0\leq x$, $y\leq1.0$). Y.Noda, M.Shimada, M.Koizumi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
J. Solid State Chem. (USA), vol.49, no.2, p.215-18 (Sept. 1983).
The full solid solutions of $MnCr_xSb$ and $CrMn_ySb$ ($0\leq x$, $y\leq1.0$) were synthesized under high temperature-pressure conditons. Products were identified by X-ray diffraction. Lattice constants were determined by a least-squares method from high-angle powder patterns. Magnetic measurement were performed using a magnetic torsion balance in the temperature range of 80-873K. (15 refs.)

119824 Susceptibility anisotropy in TMTTF salts. A.Maaroufi, S.Flandrois, C.Coulon, P.Delhaes (Centre de Recherche Paul Pascal, Domaine Univ. de Bordeaux I, Talence, France), J.P.Morand, G.Fillion.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1091-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The anisotropy of static magnetic susceptibility of several TMTTF salts is investigated by torque and SQUID measurements. Some salts become antiferromagnetic at low temperature (bromide, thiocyanate), whereas others have a non-magnetic ground state (perchlorate, hexafluorophosphate). (10 refs.)

119825 Magnetic properties of some morpholinium $(TCNQ)_2$ salts. S.Oostra, J.De Boer, P.De Lange (Labs. of Phys. Chem. & Chem. Phys., Univ. of Groningen, Groningen, Netherlands).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1387-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The magnetic susceptibilities of several substituted morpholinium $(TCNQ)_2$ salts has been measured. The results are discussed in relation to the electrical conduction properties. (14 refs.)

119826 Effect of ageing heat treatment on the magnetic behaviour of a gold-iron alloy. P.A.Beck (Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2516-21 (1 Sept. 1983).
Susceptibility and magnetisation measurements at temperatures below 200K indicate the absence of long-range ferromagnetic spin order in $Au_{82}Fe_{18}$, aged at 200°C, in spite of a considerable increase of the internal susceptibility as a result of the ageing treatment. (16 refs.)

(see also 76.50 Spin wave resonance)

119827 Calculation of the energy dissipated by slow monopoles into spinwaves. E.Tarnow.
Phys. Lett. B (Netherlands), vol.129B, no.5, p.307-9 (29 Sept. 1983).
The energy dissipated by slow monopoles into spinwaves is calculated for a ferromagnetically ordered material. (3 refs.)

119828 Magnetic excitations in the triangular spin structure of singlet-ground-state hexagonal antiferromagnet $RbFeCl_3$. N.Suzuki (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).
Solid State Commun. (USA), vol.48, no.2, p.121-3 (Oct. 1983).
The magnetic excitations observed by Petitgrand et al. (1981) in the ordered state of $RbFeCl_3$ are analyzed and understood quantitatively within the triangular spin structure model by using the dynamical correlated-effective-field approximation. It is pointed out that the singlet-ground-state character (single-ion anisotropy energy of the easy-plane type) has to be correctly taken into account to understand the magnetic excitations of $RbFeCl_3$. (18 refs.)

75.30G Anisotropy

119831 Magnets with random uniaxial anisotropy: thermodynamic properties in the large-N limit. Y.Y.Goldschmidt (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.123-44 (3 Oct. 1983).
The author shows that the random-axis model lends itself to a systematic large-N calculation. The model shows different behaviour below and above four dimensions. The equation of state is derived and discussed in terms of 'Arrott' plots. Higher-order terms in the disorder, when summed, have a crucial effect on the susceptibility which is found to be finite below four dimensions (and above four dimensions for strong disorder). A spin-glass to paramagnetic phase transition is characterized by the vanishing of the Edwards-Anderson order parameter, which differs from zero in the spin-glass phase. A cusp in the specific-heat and susceptibility is seen across the transition. The cross-over exponent and other exponents of interest are calculated. Above four dimensions a third phase appears for weak disorder and low-temperature ferromagnetic in nature. The transverse and longitudinal susceptibilities are discussed. Whereas the ferromagnetic to paramagnetic transition is characterized by mean-field exponents, the ferromagnetic to spin-glass exponents are equal to their counterparts in the non-random system in d-2 dimensions. This is shown to originate from an effective random field proportional to the EA order parameter. The flow equations in the large-N limit are also discussed. (21 refs.)

119832 Anisotropy and exchange effects in heavy rare-earth-cobalt compounds of the RCo_5 type. V.V.Kelarev, V.V.Chuev, A.N.Pirogov, S.K.Sidorov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Phys. Status Solidi a (Germany), vol.79, no.1, p.57-66 (Sept. 1983).
A series of compounds of Co and heavy rare-earth elements of the RCo_5 type (where R=Tb, Dy, Ho) is investigated by the neutron diffraction method in a wide temperature range (from 4.2 to 1050K). The atomic and magnetic structures are investigated. According to the investigations these compounds are collinear ferrimagnetics before as well as after the spin-orientation transition. The data obtained are interpreted in terms of the phenomenological theory of magneto-crystalline anisotropy of the RCo_5 compounds by Irkhin and Rosenfeld (1974). In terms of this theory the anisotropy constants of the R-sublattice (at 0K) and the parameters of intersublattice exchange are obtained. (31 refs.)

119833 Magnetic anisotropy of ion-implanted layers in iron garnet films. V.E.Osukhovskii, D.E.Linkova, V.A.Lenkov, L.A.Tsygel'nyuk, Yu.K.Milyaev, V.I.Mleko (Far-East State Univ., Vladivostok, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.377-9 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.662-6 (March 1983). [received: Oct. 1983]
A study was made of the planar magnetic anisotropy of $(EuTmCa)_3(FeGe)_5O_{12}$ iron garnet films doped by implantation of 50-135 keV H_2^+ ions in doses 1×10^{15} to 7×10^{16} cm^{-2}. The anisotropy was deduced by an analysis of theoretical and experimental torque curves. In the dose range $\phi\leq2.5\times10^{16}$ cm^{-2} the planar anisotropy field H_{ki} was proportional to the dose. At higher doses in the range $\phi>2.5\times10^{16}$ cm^{-3} this anisotropy field decreased on increase in the dose because of partial relaxation of stresses by formation of point-defect complexes. 75.30H Magnetic impurity interactions

119834 Long-range interaction of magnetic impurity states in degenerate semiconductors. Yu.M.Ivanchenko, A.E.Filippov (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.524-5 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.911-12 (March 1983). [received: Oct. 1983]
There are some semiconductors which have no components with partly filled d or f shells but nevertheless exhibit a ferromagnetic transition at low temperatures. The magnetic behavior is exhibited by this system in a very narrow range of impurity electron densities. The authors state that the monotonic part of the interaction potential is always large for $\epsilon_F\geq\epsilon_l$ (ϵ_p=impurity level) and ferromagnetic ordering is stable in a wide range of densities of the conduction electrons, in complete agreement with the observed behavior of $Pb_{1-x}Sn_xTe$. (3 refs.)

75.30K Magnetic phase boundaries

(inc. magnetic transitions, metamagnetism, etc)

119835 Remarks on phase equilibrium line in (H_xH_z)-diagram of F and CS phase of a metamagnet. W.Prystasz (Inst. for Low Temperatures & Structure Res., Polish Acad. of Sci., Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.289-93 (Sept. 1983).
It is shown that in the coexistence region of the ferromagnetic F and canted-spin CS phases the equilbirium line of these phases can correspond to the second order phase transition and coincide with the stability boundary for F phase. (2 refs.)

119836 Reversibility of phase transition of antiferromagnetic $CoCl_2.6H_2O$ under hydrostatic pressure. M.Wada, K.Takeda, A.Ohtani, A.Onondera, T.Haseda (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3188-98 (Sept. 1983).
The hydrostatic pressure dependence of the Neel temperature, magnetic phase diagram and crystal structure of the antiferromagnetic $CoCl_2.6H_2O$ (T_N=2.29K) have been studied by measurements of magnetic heat capacity, susceptibility and X-ray analysis. The anisotropy field $H_A(p)$ and the exchange constant $J(p)$ in the two-dimensional a-b plane have been found to depend linearly on pressure p as $H_A(p)=H_A(p_0)(1+0.24p)$ and $J(p)=J(p_0)(1+0.031p)$ in the range $p_0(\sim0.001$ kbar$)<p<6$ kbar. The Neel temperature $T_N(p)$, however, has been also revealed to depend linearly on p and to be reversible in the process of $p_0\rightleftarrows p$. The appearance of rounding of found irreversible in the process of compression in the critical temperature region $\epsilon(=|T-T_N|T_N)<2\times10^{-2}$. The effect of variation of magnetic dimensionality on the phase transition has been discussed considering the magnetic data and the pressure dependence of atomic or ionic distances in the crystal.

119837 A microscopic theory of the phase transition in $RbFeCl_3$-type hexagonal antiferromagnets: effects of the dipole-dipole interaction. N.Suzuki (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3199-207 (Sept. 1983).
Effects of the dipole-dipole (DD) interaction on the phase transition in $RbFeCl_3$-type hexagonal antiferromagnets are studied microscopically. The magnetic phase diagram of two typical cases is determined by the molecular-field approximation (MFA): $CsNiF_3$ (DD coupling$\gtrsim$interchain exchange coupling) and $RbFeCl_3$ (DD coupling$\ll$interchain exchange coupling). The authors show that incommensurate (IC) phases are common in these systems. Even in $CsNiF_3$, where no IC phase appears in weak fields, an IC fan structure can appear in the high field region if the magnetic field is applied along a suitable direction. As an attempt to improve the MFA the magnetic phase diagram of $RbFeCl_3$ is determined by making use of the inverse susceptibility tensor calculated by the dynamical correlated-effective-field approximation (DCEFA). (29 refs.)

119838 Origin of antiferromagnetic ordering in Bechgaard salts. J.B.Torrance (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.799-804 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The magnetic data from susceptibility and antiferromagnetic resonance experiments are summarized for the five TMTSF and TMTTF salts known to order antiferromagnetically at low temperature. It is concluded that the magnetic parameters of these compounds differ only by a factor of ~2. There are two possible mechanisms for the origin of his antiferromagnetism: (1) the formation of an Overhauser SDW (low U/4t model); and (2) the three-dimensional ordering of highly correlated electronic spins (high U/4t model). Evidence is given that the latter mechanism is dominant in one of the compounds, and possible in all of them. (21 refs.)

119839 Magnetic study of the phase transitions in $(TMTTF)_2X$ salts. S.S.P.Parkin, J.C.Scott, J.B.Torrance, E.M.Engler (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1111-14 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Antiferromagnetic resonance (AFMR) and single crystal susceptibility studies are presented for $(TMTTF)_2Br$ and $(TMTTF)_2PF_6$. The Br salt displays a magnetic phase transition below 13K, whereas the PF_6 salt exhibits a non-magnetic transition near 15K. The reason for such very different behaviour remains an intriguing question. (14 refs.)

119840 Reentry and coexistence behavior of the magnetic superconductor $(Th_{1-x}Nd_x)Ru_2$. D.Huser, M.J.F.M.Rewiersma, J.A.Mydosh, G.J.Nieuwenhuys (Kamerlingh Onnes Lab., Rijks-Univ. Leiden, Leiden, Netherlands).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1290-2 (3 Oct. 1983).
The authors have measured, via AC susceptibility χ(T,H), the superconducting and magnetic phase diagram for the $(Th_{1-x}Nd_x)Ru_2$ system. For $0.3<x<0.4$ reentry and coexistence behavior are observed at low temperatures. The field-dependent properties show that a weakened superconducting state can exist in a frozen spin-glass or cluster-glass state. Here a field memory effect can esily destroy the superconductivity. This indicates that the spin-glass phase consists of very large randomly frozen ferromagnetic clusters. (19 refs.)

119841 Critical composition of antiferromagnetic ordering in Un_xC_{1-x}. M.Ramaki, H.Matsui, G.Matsumoto, T.Kirihara (Dept. of Nuclear Engng., Nagoya Univ., Nagoya, Japan).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K93-8 (Sept. 1983).
Dilution of antiferromagnetic UN (uranium mononitride) by paramagnetic UC (uranium monocarbide) diminishes the magnetic ordering. The authors have prepared fused and comparatively pure uranium carbonitrides. Precise measurement of the low-temperature electrical resistivity was carried out with a particular emphasis of the critical composition of the antiferromagnetic ordering in U(N, C). (12 refs.)

119842 Mossbauer-effect study of the Morin transition and atomic positions in hematite under pressure. C.L.Bruzzone, R.Ingalls (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2430-40 (1 Sept. 1983).
The Mossbauer spectrum of hematite (α-Fe_2O_3) has been investigated over a range of pressures extending to 53 kbar and at temperatures ranging from 77 to 340K. Particular attention has been paid to the effects of the Morin (spin-flip) transition on the ^{57}Fe quadrupole splitting. The anomalous reduction in the quadrupole splitting at points in P-T space near the Morin transition is explained by the application of magnetic anisotropy energy-density arguments, which also yield the mean magnetic-domain size in hematite. From the low-temperature quadrupole-splitting data and knowledge of the pressure dependence of the Morin temperature rather precise information con-

cerning the location of atoms within the unit cell can be extracted. These results are in agreement with the latest high-pressure X-ray diffraction work. In addition, the hyperfine magnetic field is found to increase discontinuously by 1.5% through the pressure-induced Morin transition, similarly to the temperature-induced transition at atmospheric pressure. By taking advantage of recent advances in high-pressure technology and consistently applying the anisotropy energy-density theory of the Morin transition due to Artman, Murphy, and Foner, the authors have explained all of the features of either data, as well as the anomalies in previous work. (38 refs.)

119843 Random fields and three-dimensional Ising models: $Co_xZn_{1-x}F_2$. M.Hagen, R.A.Cowley (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland), S.K.Sataja, H.Yoshizawa, G.Shirane, R.J.Birgeneau, H.J.Guggenheim.
Phys. Rev. B (USA), vol.28, no.5, p.2602-13 (1 Sept. 1983).
The phase transition and ordering of the $d=3$ diluted Ising antiferromagnet $Co_xZn_{1-x}F_2$ has been studied using two-axis neutron diffraction for the cases (i) where x is close to the percolation threshold, in zero applied magnetic field, and (ii) as a function of applied magnetic field for samples with $x=0.26$ and 0.35. The results of the percolation study show complicated behavior, probably due to concentration gradient problems. Nevertheless, there is strong evidence that the inverse correlation length decreases to zero at the onset of long-range order. The results of the magnetic field study are compared with the theoretical predictions for the $d=3$ Ising model in a random field. It is found that when the samples are cooled in even the smallest (nonzero) fields the long-range magnetic order is destroyed and that the structure factor is well described by the Lorentzian plus Lorentzian squared form. The inverse correlation length is found to have a power-law dependence on the applied magnetic field at low temperature with exponents $\nu_H=2.17\pm0.3$ for the $x=0.26$ sample and $\nu_H=3.63\pm0.3$ for the $x=0.35$ sample. This result is not consistent with the current theoretical predictions for the field dependence of the inverse correlation length in the $d=3$ Ising model in a random field. The measurements also show that the system is frozen at low temperatures and this freezing may be responsible for the discrepancy between theory and experiment. (27 refs.)

119844 Mossbauer studies of the static and dynamic critical behavior of the layered antiferromagnets $RbFeF_4$ and $KFeF_4$. H.Keller, I.M.Savic (Phys.-Inst., Univ. Zurich, Zurich, Switzerland).
Phys. Rev. B (USA), vol.28, no.5, p.2638-52 (1 Sept. 1983).
Detailed ^{57}Fe Mossbauer studies of the static and dynamic critical behavior of the layered antiferromagnets $RbFeF_4$ and $KFeF_4$ are reported. All measurements were performed on single crystals with the direction of the γ rays perpendicular to the magnetic layers. Both systems undergo a second-order phase transitions at the Neel temperature $T_N=133.57(2)$K for $RbFeF_4$ and $T_N=135.79(2)$K for $KFeF_4$. Special attention was given to a careful evaluation of reliable values for the critical indices. In the asymptotic critical region below T_N, the temperature dependence of the hyperfine field H is well described by the power law $H\propto t^\beta$, where β is the static critical exponent of the order parameter, and $t=1-T/T_N$ is the reduced temperature. The following asymptotic values for β were found: $\beta=0.316(3)$ for $RbFeF_4$ in the range $5\times10^{-4}<t<10^{-2}$ and $\beta=0.151(3)$ for $KFeF_4$ in the range $3.8\times10^{-4}<t<5.7\times10^{-2}$. These results indicate that $RbFeF_4$ shows a three-dimensional critical behaviour, in contrast to $KFeF_4$, where the magnetic transition is essentially two dimensional in nature. The present values of β disagree considerably with the nonasymptotic values previously reported by other groups. Just above T_N a characteristic line broadening $\Delta\Gamma$ due to critical spin fluctuations is observed. At the critical point $\Delta\Gamma$ diverges as $\Delta\Gamma\propto|t|^{-w}$, where the exponent ω involves, besides two static exponents, the dynamic exponent z. In the critical region $10^{-4}<|t<10^{-3}$, the following values for w and the corresponding values for z were obtained: $\omega=0.81(6)$, $z=2.15(19)$ for $RbFeF_4$ and $\omega=0.91(5)$, $z=1.29(9)$ for $KFeF_4$. These values are compared to those predicted by the current theory of critical dynamics. At T_N the center shift and the quadrupole splitting shows a pronounced anomaly that appears to be associated with the onset of magnetic ordering. (53 refs.)

119845 A magnetic phase transition in UNi_2Si_2. L.Chelmicki, J.Leciejewicz (Inst. of Nuclear Res., Otwock, Poland), A.Zygmunt.
Solid State Commun. (USA), vol.48, no.2, p.177-9 (Oct. 1983).
Neutron diffraction study of polycrystalline UNi_2Si_2 performed at low temperatures shows that a LSW type of magnetic order present at 4.2K transforms in the temperature range between 53±3K and 70±3K into a collinear antiferromagnetic structure of $+-+-$ type. The Neel point is 103±3K. The magnitude of magnetic moment on U ion is 2.89±0.07 Bohr magnetons at 4.2K and 1.66±0.04 Bohr magnetons at 80K. (10 refs.)

119846 Influence of uniaxial pressure on the Neel temperature of antiferromagnet $CuCl_2.2H_2O$. V.A.Galushko, V.P.Kul'batskii, Yu.G.Pashkevich, V.L.Sobolev, V.T.Telepa (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.527-8 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.915-17 (March 1983). [received: Oct. 1983]
The authors describe an investigation of the influence of uniaxial pressure on T_N of $CuCl_2.2H_2O$, which enabled them to determine not combinations of magnetoelastic constants, but their individual values. The influence of uniaxial pressure on T_N was investigated by the NMR method and temperatures T were measured to within $\pm5.10^{-6}$K. (6 refs.)

119847 New magnetic phase transition in manganese ferrite at low temperatures. K.P.Belov, A.N.Goryaga, V.N.Pronin, L.A.Skipetrova (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.548-9 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.950-3 (March 1983). [received: Oct. 1983]
The authors investigate some of the electrical and magnetic properties of Mn ferrites to determine whether an additional phase transition takes place. They investigated a sample of $MnFe_2O_4$ synthesized by the ceramic technology. The sample was used to measure the longitudinal $(\Delta R/R)\parallel$ and transverse $(\Delta R/R)\perp$ magnetoresistance, magnetocaloric effect ΔT, specific magnetization σ, and electrical resistivity ρ in the temperature range 77-294K. 75.40 CRITICAL-POINT EFFECTS, SPECIFIC HEATS, SHORT-RANGE ORDER

(inc. spin glasses)

119848 Dynamic theory of spin glasses. A.Togashi, M.Suzuki (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2994-3002 (Sept. 1983).
A dynamic theory of spin glasses is presented based on the extended mean-field theory of Thouless, Anderson, and Palmer. The kinetic equations for the magnetization and the spin correlation function are derived, from which dynamical linear and nonlinear susceptibilities are calculated and their low-frequency behavior is mainly investigated. The spin self-correlated functions have different relaxation times near above and below T_c—the former is proportional to $|T-T_c|^{-2}$, while the latter to $|T-T_c|^{-4}$—which shows the asymmetric critical slowing down. A qualitative comparison of the present results with experimental data is presented.

119849 The dynamical susceptibility of metallic spin glass compound $(Ti_{1-x}V_x)_2O_3$: frequency and field dependences. T.Saito (Dept. of Phys., Hokkaido Univ., Sapporo, Japan), C.J.Sandberg, Y.Miyako.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3170-9 (Sept. 1983).
The real, Re $_{\chi0}(\omega,H)$, and the imaginary, Im $_{\chi0}(\omega,H)$, components of AC-susceptibility were measured on $(Ti_{0.9}V_{0.1})_2O_3$ and $(Ti_{0.98}V_{0.02})_2O_3$ crystals in the static magnetic field H as well as in zero field. The experimental results were analyzed using a modified Debye model which is applicable to the magnetic system with multi-relaxation times and it was found that spin glass freezing is characterized by a noticeable change in the distribution of relaxation times. The spin glass freezing temperature $T_g(H)$ is determined from the inflection point of $Im_{\chi0}(\omega,H)$ and is given as a function of H. From H vs. $T_g(H)$ curve, the (Almeida-Thouless) critical line $H_c(T)$ is obtained as $H_c(T)\sim\epsilon^{1.6}$, where $\epsilon=(T_g(H)-T_g(0))/T_g(0)$. (40 refs.)

119850 Metastable states in anisotropic spin glasses. II. Uniaxial anisotropy. S.A.Roberts (Dept. of Theoretical Phys., Univ. of Manchester, Manchester, England).
J. Phys. C (GB), vol.16, no.28, p.5465-79 (10 Oct. 1983).
For pt.I see ibid., vol.15, p.4155 (1982). The numbers N_s and properties of the zero-temperature metastable states of an infinite-range spin glass with single-ion uniaxial anisotropy are investigated. The 'direct average' $\langle N_s\rangle_J$ over the bond distribution is evaluated, rather than $\langle \text{In } N_s\rangle_J$, leading to results which are exact above a critical energy ϵ_c. The phase transitions found in the model by Roberts and Bray (1982) and Cragg and Sherrington (1982) are again present. The Hessian and spin-wave spectra are found to be gapless in all three phases. (16 refs.)

119851 Spin glass-like behaviour in the 1D mixed compound CHAC:Mn. A.Cheikhrouhou (Faculte des Sci. et Tech. de Sfax, Sfax, Tunisia), C.Dupas, J.P.Renard.
J. Phys. Lett. (France), vol.44, no.18, p.L777-84 (15 Sept. 1983).
The a.c. susceptibility of the quasi-1D mixed compound $C_6H_{11}NH_3Cu_{1-x}Mn_xCl_3$ (CHAC:Mn) exhibits at T_{max} a frequency dependent maximum. Remanence effects on the magnetization appear below T_{max}. The variations with field, time and temperature of the thermoremanent and isothermal remanent magnetizations are similar to those observed in classical spin glasses. These measurements suggest spin glass-like behaviour in linear chains with random exchange at very low impurity concentration. (11 refs.)

119852 Change of concavity of the field temperature transition lines at short times in the $Eu_{0.4}Sr_{0.6}S$ spin glass. J.Rajchenbach, N.Bontemps (Lab. d'Optique Phys., ESPCI, Paris, France).
J. Phys. Lett. (France), vol.44, no.18, p.L799-804 (15 Sept. 1983).
The authors report on the transverse and longitudinal response in $Eu_{0.4}Sr_{0.6}S$ with a small a.c. field (10^2-10^5 Hz) superimposed to a large static one. From the onset of the imaginary susceptibility, they derive transition lines, identical in both configurations, which exhibit, at low field, a reversed curvature more pronounced with increasing frequency. The isotropy of the response is assigned to the dipolar interaction. The results are compared to mean field theory and numerical simulations. (20 refs.)

119853 Local environment effects on the magnetic state of Fe in amorphous $Cu_{0.6}Zr_{0.4-x}Fe_x$ alloys. H.Von Lohneysen, G.V.Lecomte, J.Kastner, H.J.Schink, R.Van Den Berg (Phys. Inst., RWTH Aachen, Aachen, Germany).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.47-50 (3 Oct. 1983).
Measurements of the susceptibility χ and specific heat C of melt-spin amorphous $Cu_{0.6}Zr_{0.4-x}Fe_x$ ($0.05\leq x\leq0.1$) are reported. They show that for $x=0.08$ and $x=0.1$ a small fraction of Fe atoms retain their magnetic moment, leading to spin glass like behaviour in χ and C. In contrast, for $x=0.05$ no magnetic Fe atoms can be detected from χ, and bulk supercon-

ductivity is observed below 0.1K. These results are attributed to the strong sensitivity of the Fe magnetic moment to its local environment. (18 refs.)

119854 Role of initial conditions in the mean-field theory of spin-glass dynamics. A.Houghton, S.Jain, A.P.Young (Dept. of Maths., Imperial Coll., London, England).
Phys. Rev. B (USA), vol.28, no.5, p.2630-7 (1 Sept. 1983).
The authors discuss the dynamics of the infinite-range Sherrington-Kirkpatrick spin-glass model for which relaxation times diverge when N, the number of spins, tends to infinity. Calculations on large but finite system are very difficult, so they mimic a large finite system in equilibrium by working with $N=\infty$ and imposing, by hand, a canonical distribution at an initial time. For short times, where no barrier hopping has occurred, they find that the Edwards-Anderson order parameter, q_{EA}, is identical to that obtained from an analysis of the mean-field equations of Thouless, Anderson, and Palmer and, with further assumptions, gives $q(x=1)$ in Parisi's theory, in agreement with earlier work. For times longer than the longest relaxation time (of the finite system), true equilibrium is reached and the authors' theory agrees with previous statistical-mechanics calculations using the replica trick. There is no violation of the fluctuation-dissipation theorem. (19 refs.)

119855 Low-temperature heat capacity of antiferromagnetic ternary rare-earth iron silicides $M_2Fe_3Si_5$. C.B.Vining, R.N.Shelton (Dept. of Phys., Iowa State Univ., Ames, IA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2732-42 (1 Sept. 1983).
The low-temperature heat capacity of antiferromagnetic ternary iron silicides $M_2Fe_3Si_5$ (M=Sm, Gd-Yb) has been measured from 0.5 to 30K. Antiferromagnetic ordering temperatures range from 1.06 to 10K for these materials including multiple magnetic transitions in $Sm_2Fe_3Si_5$, $Tb_2Fe_3Si_5$, and $Er_2Fe_3Si_5$. Magnetic ordering via the Ruderman-Kittel-Kasuya-Yosida interactions is indicated, even in the presence of large crystalline electric field effects. Entropy considerations indicate the magnetic ground state is a doublet in all of these materials except $Gd_2Fe_3Si_5$. Anomalous behaviour is observed with respect to spin-wave and nuclear contributions to the total heat capacity, crystalline electric field effects, and critical behavior. (14 refs.)

119856 The H-T phase diagram of the Y:Er spinglass. R.Wendler, K.Baberschke (Inst. fur Atom- und Festkorperphys., Freie Univ. Berlin, Berlin, Germany).
Solid State Commun. (USA), vol.48, no.2, p.91-4 (Oct. 1983).
DC magnetization measurements are presented for 4% YEr single crystals—an Ising like spinglass. The onset of irreversibilities, defined by $T_f(H)$, follows the theoretical predictions of the mean field Ising calculation by de Almeida-Thouless (1978). In addition, the onset of viscous behavior, determined by the time dependence of the magnetization, agrees with the AT line of instability, too. (25 refs.)

119857 On the behaviour of spin-glasses in crossed magnetic fields. S.V.Maleyev (Leningrad Nuclear Phys. Inst., Leningrad, USSR).
Solid State Commun. (USA), vol.48, no.4, p.329-31 (Oct. 1983).
The information on the dynamical properties of spin-glasses which can be measured from experimental investigation of magnetization induced by two crossed magnetic fields is discussed. (8 refs.)

119858 Cascade of orientational phase transitions in substituted thulium orthoferrite. A.M.Kadomtseva, I.B.Krynetskii, K.Krezhov, A.S.Moskvin, T.L.Ovchinnikova, M.M.Lukina (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.502-3 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.877-80 (March 1983). [received: Oct. 1983]
An investigation of the nature of various spin-reorientation transitions observed in pure and substituted rare-earth orthoferrites has provided information necessary for the control of the magnetic anisotropy of these compounds. The authors report that introduction of a certain amount (x=0.3) of the Jahn-Teller Mn^{3+} ions into thulium orthoferrite gives rise to a whole cascade of spin-reorientation transitions. They carried out a comprehensive (including neutron-diffraction) investigation of changes in the magnetic structure as a result of spin reorientation in $TmFe_{1-x}Mn_xO_3$ orthoferrites with x=0.12, 0.21, and 0.33. 75.40D Ising and other classical spin models

119859 Theory on the two- and three-dimensional Ising model with periodically distributed frustrations. T.Oguchi (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3101-9 (Sept. 1983).
The approximate theory on the Ising model with periodically distributed frustrations is proposed and applied to several two- and three-dimensional lattices. In this theory the lattice is divided into several sublattices and the molecular field at each sublattice is determined self-consistently. The transition temperature, thermal average of spin, and spin correlation functions between nearest neighbors are calculated and discussed. (16 refs.)

119860 Surface magnetism in amorphous semi-infinite Ising ferromagnets. I.Tamura, T.Kaneyoashi (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3208-14 (Sept. 1983).
Surface magnetism and phase diagram in amorphous semi-infinite ferromagnets are studied on the basis of the lattice model of amorphous magnets. The authors find that surface ordering is expected in amorphous ferromagnets more than in crystalline ones.

119861 Direct determination of the probability distribution for the spin-glass order parameter. A.P.Young (Dept. of Maths., Imperial Coll., London, England).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1206-9 (26 Sept. 1983).
The recent interpretation of Parisi's (1980) order-parameter function $q(x)$ in terms of a probability distribution for the overlap between magnetizations in different phases is investigated by Monte Carlo computer simulation for the infinite-range Ising spin-glass model. The main features of the solution for $q(x)$ are reproduced, in particular $q(x)\propto x$ as $x\rightarrow 0$ and $q'(x)=0$ at $q=q_{max}$, the largest value. Finite-size effects prevent one from establishing with certainty whether there is a 'plateau', i.e. $q'(x)=0$ for a range of x. (15 refs.)

119862 Phase diagram of a spin glass of $Eu_pSr_{1-p}S$. S.Katsura, A.Matsuno (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).
Phys. Status Solidi b (Germany), vol.119, no.1, p.73-7 (1 Sept. 1983).
$Eu_pSr_{1-p}S$ is modeled as a site-diluted Ising model with first and second neighbor interactions ($J>0$, $J'<0$) between Eu atoms, on a lattice with square coordination number z_c. By use of the reducibility of the four-body density matrix to the one-body density matrix, an integral equation for the distribution function for the effective field is obtained. The integral equation for the case $J'=-J/2$ is solved exactly at $T=0$ in the case of $z_c=2$ and the three solutions for the paramagnetic, ferromagnetic, and the spin glass states are obtained. The boundary between the ferromagnetic and spin glass state is given by $p_{FG}=0.545$ and the phase diagram shows a reentrant behavior. (4 refs.)

119863 Random-field critical behaviour of a $d=3$ Ising system. D.P.Belanger, A.R.King, V.Jaccarino, J.L.Cardy (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2522-6 (1 Sept. 1983).
Optical birefringence studies of the randomly diluted, $d=3$ Ising antiferromagnet $Fe_{0.6}Zn_{0.4}F_2$ reveal that the magnetic specific heat exhibits a symmetric logarithmic singularity, consistent with an effective dimensionality $\bar{d}\simeq 2$, in small magnetic fields H applied parallel to the unique axis. The nature and the sharpness of the phase transition for $H\leq 20$ kOe and reduced temperature $5\times 10^{-4}\leq t\leq 10^{-1}$ suggest that the lower critical dimensionality $d_l<3$. Both of these results are inconsistent with the predicted mapping $\bar{d}=d-2$, for the random-field problem, obtained from perturbation theory. The observed crossover exponent $\phi=1.40\pm 0.05$ agrees with both the measured and predicted random-exchange susceptibility exponent γ as is to be expected. The observed amplitude of the shift in T_c with H agrees with a new theory of random-field effects in diluted antiferromagnets. (28 refs.)

119864 External stress influence on the spin-Peierls phase diagram of the XY model. R.A.T.de Lima (Dept. de Fisica, Univ. Federal de Sao Carlos, Sao Carlos, Sao Paulo, Brazil), C.Tsallis.
Solid State Commun. (USA), vol.48, no.4, p.321-4 (Oct. 1983).
The authors discuss, within a framework in which the structural degrees of freedom (assumed essentially three-dimensional) are adiabatically treated and the magnetic degrees of freedom are exactly treated (as far as the disordered-phase results and the second order critical frontiers are concerned), the stress-(magnetic) field-temperature phase diagram associated withthe one-dimensional first-neighbour spin-$^1/_2$ magneto strictive XY model. The important influence of the curvature of the coupling constant as a function of distance is exhibited and satisfactorily compared to experimental data. (11 refs.)

119866 Effect of replacing iron with titanium, zirconium, and hafnium on the initial magnetic permeability of manganese-zinc ferrites. G.V.Fomenko, L.A.Bashkirov (Inst. of Solid-State Phys. & Semiconductors, Acad. of Sci., Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.11, p.1622-4 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1886-9 (Nov. 1982).
The temperature dependence of the initial magnetic permeability of the ferrites $Mn_{0.8}Zn_{0.2}Fe_x{}^{2+}M_x{}^{4+}M_x{}^{4+}Fe_{2-2x}{}^{3+}O_4$ and $Mn_{0.59+y}Zn_{0.3}Fe_{0.11}{}^{2+}M_y{}^{4+}Fe^{3+}{}_{2-2y}O_4$, where M is Ti, Zr, or Hf, x=0, 0.02, 0.04, 0.06, 0.08, 0.105, or 0.13, y=0, 0.02, 0.05, 0.07, 0.11, has been investigated. For certain compositions a weak dependence of the initial magnetic permeability on temperature is observed over certain temperature intervals. (6 refs.)

119867 Space-time correlation properties of the magnetization process and eddy current losses: theory. G.Bertotti (Istituto Elettrotecnico Nazionale Galileo Ferraris, CNR, Torino, Italy).
J. Appl. Phys. (USA), vol.54, no.9, p.5293-305 (Sept. 1983).
The relationship between eddy current losses and magnetization dynamics is investigated on general bases, starting directly from the Maxwell equations. The intrinsically stochastic character of the magnetization process is conveniently dealt with by describing the magnetization rate $\dot{I}(\mathbf{r},t)$ as a random sequence of elementary magnetization jumps, each corresponding to a sudden and localized displacement of a domain wall segment in the material. A general equation is obtained, in which the loss is expressed in terms of the average energy spectrum $|\dot{I}(\mathbf{k},\omega)|^2$ of $\dot{I}(\mathbf{r},t)$. The loss calculation is thus reduced to the statistical problem of determining the energy spectrum of the random quantity $\dot{I}(\mathbf{r},t)$ as a function of the shape and correlation properties of the elementary magnetization events. It turns out that the hysteresis loss is related to the internal structure of the elementary jumps, while the dynamic and anomalous losses are instead determined by the space-time correlation properties of the jump sequence. An explicit expression for the dynamic loss is obtained in the important case where the magnetization process is described as a Markov process, leading to a clear-cut, direct link between the loss and the fundamental quantities which characterize the magnetization dynamics at a microscopic level. The model predicts the exact value of the Pry and Bean loss, as a particular case corresponding to very specialized correlation properties of the jump sequence. However, the model permits one to deal with actually more general and realistic descriptions of the domain structure dynamics. It is believed that future applications to practical cases will provide a deeper understanding of the physical origin of loss anomalies. (20 refs.)

119868 Magnetization reversal in cobalt-phosphorus films. G.F.Hughes (Seagate Technol., Scotts Valley, CA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5306-13 (Sept. 1983).
A brief review is given of preparation, structure, and magnetization reversal in Co-P thin films for digital recording. From this, a magnetization reversal theory is developed which correctly predicts a number of observed facts about

Co-P. Among these are $M_r/M_s>0.80$, $H_c/H_k\simeq0.1$ (conventional theory predicts 0.64 and 0.52, respectively), avalanche and cluster reversal mechanisms, transverse ripple, and sawtooth structure in recorded bits. Limitations to high bit and track density recording are discussed. It is suggested that lower M_r/M_s remanent squareness values may alleviate these density limiting mechanisms. (55 refs.)

119869 On the mean field theory bound on the magnetization. J.Slawny (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Stat. Phys. (USA), vol.32, no.2, p.375-88 (Aug. 1983).
The mean field bound on magnetization is proved for a class of one-component ferromagnetic systems and for D components systems with arbitrary D. (7 refs.)

119870 Frequency dependence of the complex initial permeability on Permalloy strips. G.Dietzmann, M.Schaefer (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Nachrichtentech. Elektron. (Germany), vol.33, no.9, p.375-81 (1983). In German.
Eddy-current loci of the complex permeability of sheet metals are calculated in the case of disappearing alternating field strength on the assumption that the local initial permeability decreases from the sheet metal middle towards the surfaces according to a power law. The theory allows the description of measured loci of Permalloy strips of different thickness within a mean error of 1%. A semicircle approximation is indicated which approximates very well the theoretical loci up to the frequencies at which the loss component of the complex permeability passes the maximum. (12 refs.)

119871 On the coercive field of the nearly non-magnetostrictive amorphous ferromagnetic alloy $Co_{58}Ni_{10}Fe_5Si_{11}B_{16}$. W.Beck, H.Kronmuller (Inst. fur Theoretische und Angewandte Phys., Univ. Stuttgart, Stuttgart, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.109-14 (Sept. 1983).
The coercive field of nearly non-magnetostrictive amorphous alloys is predominantly determined by quenching conditions, relaxation processes, and the surface roughness. Taking into account surface effects and magnetostrictive contributions to the coercive field it is possible to separate different coercive field contributions and to predict the value and the conditions for obtaining a minimum coercive field. The effects of the quenching rate on spin quenched ribbons are measured. (13 refs.)

119872 Magnetic and Mossbauer studies of some mixed cobaltites of the lanthanides and alkali metals. D.K.Chakrabarty, A.Bandyopadhyay, S.B.Patil, S.N.Shringi (Dept. of Chem., Indian Inst. of Technol., Bombay, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.213-22 (Sept. 1983).
Magnetic and Mossbauer studies are carried out on compounds $M_xLn_{1-x}CoO_3$ where M is Ba or Sr and Ln is La, Nd or Dy. All compositions with $x>0.2$ with the exception of the dysprosium compounds are ferromagnetic at low temperatures. From hysteresis and initial susceptibility studies, it is concluded that they contain a number of single domain clusters in a paramagnetic matrix. Mossbauer spectra of $Ba_{0.3}Nd_{0.7}CoO_3$ and $Ba_{0.5}Dy_{0.5}CoO_3$ show two resonance lines and that of $Sr_{0.5}La_{0.5}CoO_3$ shows a single line spectrum at all temperatures, and no hyperfine spectra are shown even far below T_C. The results are interpreted in terms of short-range magnetic ordering in these systems. (24 refs.)

75.60G High coercivity materials

119873 High coercive force 2-17-type $Sm_{1-x}Er_x(Co_{0.69}Fe_{0.22}Cu_{0.08}Zr_{0.02})_{7.22}$ magnets with a low temperature coefficient. H.F.Mildrum, J.B.Krupar (Magnetics Lab., School of Engng., Univ. of Dayton, Dayton, OH, USA), A.E.Ray.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.261-7 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
High energy permanent magnet alloys with internal temperature compensation corresponding to the formula $Sm_{1-x}Er_x(Co_{0.69}Fe_{0.22}Cu_{0.08}Zr_{0.02})_{7.22}$ ($x=0$, 0.2, 0.4) were characterized by optical metallography, combined scanning electron microscopy and energy-dispersive X-ray analysis, electron microprobe analysis and X-ray diffraction. Sintered magnets were prepared from the induction-melted alloys, ground in the as-cast and homogenized states and sintered with and without a sintering aid. Reversible temperature coefficients α and salient magnetic properties were also investigated. These results indicate that erbium-containing alloy compositions, with proper sintering, solutioning, isothermal aging and controlled cooling heat treatments, can achieve a very high coercive force combined with the desired thermal magnetic behavior for many device applications. (14 refs.)

119874 Internal temperature compensation of rare earth-cobalt permanent magnets for microwave devices by adding heavy lanthanides. K.J.Strnat (Dept. of Electrical Engng., Univ. of Dayton, Dayton, OH, USA), A.Tauber.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.269-74 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The temperature variation of the remanent flux of rare earth-transition metal permanent magnets can be minimized by making appropriate substitutions of heavy lanthanides in the alloy. The underlying physical principle, its use in sintered magnets and some problems and limitations are reviewed. Recent successful applications to 2-17-type magnets are discussed. Difficulties in using the concept of temperature coefficient are outlined. (27 refs.)

119875 Intermetallic compounds for permanent magnets: current status and future trends. K.S.Narasimhan (Crucible Res. Center, Colt Industries, Pittsburgh, PA, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.275 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given, as follows. Permanent magnets have found an important place in modern technology by providing a convenient medium for the transfer of energy from one form to another. A variety of intermetallic compounds containing cobalt and iron have been synthesized, some of which have found use as permanent magnets. The basic requirements for an alloy to be a permanent magnet are a reasonable saturation magnetization, a high Curie temperature and shape or crystal anisotropy. Alnicos, elongated single-domain materials and oxide ferrites have satisfied these requirements and have been in commercial production for over 20 years. The increasing need for higher saturation magnetization and coercive force combined with the demand for materials with reduced cobalt content and better machinability has resulted in the development of newer magnetic materials during the past decade which satisfied one or more of the needs of the magnet industry.

75.60J Fine-particle systems

119876 Superparamagnetism and magnetic granulometry of vitroceramics containing iron-lithium ferrite. C.Chaumont, J.C.Bernier (Dept. Sci. des Materiaux, CNRS, ENSCS, Strasbourg, France).
Solid State Commun. (USA), vol.48, no.4, p.357-9 (Oct. 1983).
Magnetic properties of lithium ferrite crystallites distributed in a glassy matrix vary with their average size d: (1) $d\leq100$ Å: superparamagnetism d and the limits of the distribution have been calculated by fitting magnetisation curves vs. applied field, (2) $d\gtrsim150$ Å: ferrimagnetism with a hysteresis loop maximum for the monodomain size (260 ± 40 Å). (3) $100\leq d\leq150$ Å: superposition of the two preceding phenomena. (10 refs.)

75.70 MAGNETIC FILMS AND PLATES

119877 Crystallographic structures and perpendicular magnetization of GdFe films sputtered with substrate bias voltage. M.Nawate, M.Ohkoshi, S.Honda, T.Kusuda (Dept. of Electronics, Hiroshima Univ., Higashi-Hiroshima, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L447-9 (July 1983).
Crystallographic structures of sputtered Fe and GdFe films both with and without substrate bias voltage were investigated using an X-ray diffractometer. Films sputtered from lower Gd composition target show the crystalline phase. It was found that (110) orientation of BCC Fe in the films was improved by the small amount of incorporated Gd atoms with the existence of substrate bias voltage. Films possessing magnetization aligned perpendicular to the film plane were obtained with the application of −200 V and −300 V bias voltage to the substrate. (8 refs.)

119878 A comparison of the uniaxial anisotropy in sputtered Co-Re and Co-Cr perpendicular recording media. Tu Chen, G.B.Charlan (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5103-11 (Sept. 1983).
The effect of the presence of an intermetallic compound on the microstructure, crystalline anisotropic orientation, and perpendicular magnetic hysteretic properties was investigated based on CoRe and CoCr alloys. The results suggest that a phase segregation causes the formation of an intermetallic compound, Co_3Cr, in the Co-rich CoCr alloy film. Consequently, it leads to the growth of isolated columnar particles because of the fact that the alloy composition lies within the two-phase region in the phase diagram. For homogeneous CoRe and CoCr alloys at high temperature, the resultant microstructures in a deposited film show equiaxial particles characterized by a large grain diameter. Magnetic hysteretic measurement on the film having various microstructure shows that high coercivity and good perpendicular anisotropy in the CoCr film is primarily due to the formation of isolated columnar particles in addition to the *c*-axis preferred orientation. Films having good *c*-axis preferred orientation but not the isolated columnar structure can not give good hysteretic properties for perpendicular recording media application. Also it was concluded in this work that in an isolated columnar structure film, the extent of *x*-axis dispersion (i.e., the value of $\Delta\theta_{50}$) affects the sharpness of the knee, but the H_c of the perpendicular hysteresis loop is not affected significantly. (17 refs.)

119879 Interface magnetism of Fe-Sb multilayered films with artificial superstructure from ^{57}Fe and ^{121}Sb Mossbauer spectroscopy, neutron diffraction and FMR experiments. T.Shinjo, N.Hosoito, K.Kawaguchi, T.Takada (Inst. for Chem. Res., Kyoto Univ., Uji, Kyoto, Japan), Y.Endoh, Y.Ajiro, J.M.Friedt.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3154-62 (Sept. 1983).
Multilayered films with artifical superstructure, consisting of Fe and Sb layers were prepared by UHV deposition technique. Individual Fe and Sb layers were varied from 2 to 42 Å and from 8 to 41 Å, respectively. ^{57}Fe and ^{121}Sb Mossbauer spectroscopy, neutron diffraction and ferromagnetic resonance experiments were applied to these films and the magnetic properties of the Fe interface in contact with Sb are discussed.

119880 Pulsed magnetization switching in iron garnet films. V.V.Randoshkin, A.F.Martynov, Yu.A.Durasova, M.A.Lyu-fachun (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.537-8 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.931-4 (March 1983). [received: Oct. 1983]
The authors report an investigation of the influence of a static bias field H_b and of the amplitude of a magnetizing pulsed field H_p on the process of magnetization switching in saturated iron garnet films. The investigation was carried out by the method of high-speed photography. A pulsed field was generated in a planar coil of diameter ~2 mm located on the surface of a sample. In the initial state, a field H_b was used to saturate a sample and H_p was applied antiparallel to H_b. Dynamic domains were observed in the field of a microscope over an area of $\sim 3.10^4\ \mu^2$. (6 refs.)

75.70K Domain structure (magnetic bubbles)

119881 Static properties of magnetic bubbles in garnet films with orthorhombic anisotropy. D.J.Breed, W.de Geus (Philips Res. Labs., Eindhoven, Netherlands).
J. Appl. Phys. (USA), vol.54, no.9, p.5314-21 (Sept. 1983).
The static properties of bubbles in (110) oriented garnet films of composition $(Gd, Y)_3(Fe, Mn, Ga)_5O_{12}$ have been studied. The anisotropy in these films is orthorhombic with the easy axis of magnetization perpendicular to the plane of the film and a secondary easy axis in the plane of the film. Two types of bubbles can be distinguished, *A*-type bubbles having no Bloch lines and *B*-type bubbles with Bloch lines. Magnetic fields parallel to the in-plane easy axis of magnetization have a strong influence on the diameter and on the collapse field. Whereas the properties of the *B*-type bubbles are independent of the sign of this in-plane field, the properties of the A-type bubbles do depend on the sign of this in-plane field. *B*-type bubbles easily change state and become A-type under influence of in-plane fields. At zero in-plane field the collapse fields of *B*-type bubbles are about 1 to 3% larger than the collapse fields of *A*-type bubbles. A theory is presented that takes into account the interaction between in-plane field and domain wall magnetization. In this way the experimental data obtained for the *A*-type bubbles are reproduced very well. The difference between the collapse fields of *A*- and *B*-type bubbles in zero in-plane field is explained by taking into account the influence of stray fields and Bloch lines on the domain wall energy. (14 refs.)

119882 Ferromagnetic resonance study of magnetic anisotropy and domain observations in implanted garnets misoriented from (111). H.Niedoba, C.Nourtier, I.B.Puchalska (Lab. de Magnetisme et d'Optique des Solides, CNRS, Meudon, France), P.Gerard.
J. Appl. Phys. (USA), vol.54, no.9, p.5322-30 (Sept. 1983).
The magnetic anisotropy of nonimplanted and implanted layers in garnet films misoriented from (111) has been studied by ferromagnetic resonance (FMR). The measured FMR field orientation dependence is consistent with a phenomenological model taking into account the growth-induced and stress-induced anisotropy contributions. The effective uniaxial anisotropy field $H_K\nabla$, cubic magnetocrystalline anisotropy field H_1, and anisotropy fields proportional to the crystallographic misorientation angle Δ_c:$H_K{}^\delta$ and H_p (orthorhombic anisotropy field) are determined from the resonance field orientation dependence in two different planes. In the implanted layer only two stable equilibrium magnetizations exist. Charged wall motion is consistent with the easy and hard magnetization directions deduced from FMR. (16 refs.)

119883 Domain wall mobility in epitaxial iron garnet films. N.V.Shakhova (M.V. Frunze State Univ., Simferopol, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.530-1 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.920-2 (March 1983). [received: Oct. 1983]
The method developed previously by Abyzov et al. (1979) and Zuev et al. (1980) is used to study magnon dynamic retardation of a plane isolated domain wall moving in an iron garnet film at a low speed V. The domain wall structure is determined by minimizing the energy of the ferromagnet. (4 refs.)

119884 Formation of an array of magnetic bubbles in ferrite garnet films. V.G.Bar'yakhtar, V.L.Dorman, Yu.A.Kuzin, Yu.V.Melikhov, E.F.Khodosov (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.562-3 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1306-9 (Nov. 1982). [received: Sept. 1983]
Reports a study of the formation of a bubble array from a labyrinthal domain structure in a uniaxial ferrite garnet film under the influence of a periodic train of magnetic field pulses directed parallel to the easy axis. The array formation process was studied by means of the Faraday effect in a magnetooptic apparatus using a polarizing microscope. The pulsed magnetic field was produced by a pair of parallel planar conductors separated by a distance on the order of 400 μm. (9 refs.)

119885 Magnetostatic waves in a magnetic bubble. I.V.Zavislyak.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1403-8 (Sept. 1983). In Russian.
The spectrum of magnetostatic waves has been investigated in a magnetic bubble. It is shown that both surface and bulk magnetostatic waves can propagate along the magnetic bubble. New types of bulk magnetostatic waves are detected. Theoretical results are compared with the experimental data. (16 refs.)

75.80 MAGNETOMECHANICAL AND MAGNETOELECTRIC EFFECTS, MAGNETOSTRICTION

119886 Magnetoelastic dynamics of amorphous ferromagnets. A.Hernando, V.Madurga, M.Liniers (Lab. de Magnetismo, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. A (Spain), vol.79, no.2, p.136-44 (May-Aug. 1983). [received: Oct. 1983]
A study about the dependence of the elastic constants with magnetic applied field in ferromagnetic amorphous ribbons has been carried out. Theory predicts an anomalous and sharp increment for the rigidity modulus originated by irreversible domain wall motion in uniaxial ribbons. The authors report a method to generate magnetically extensional and torsional modes which allowed them to observe this anomalous transition. (17 refs.)

119887 Influence of the torsional elastic strain on the magnetic behaviour in pure polycrystalline nickel. J.M.Gonzalez, V.Madurga, A.Hernando (Lab. de Magnetismo, Univ. Complutense, Madrid, Spain), A.Garcia-Escorial.
An. Fis. Ser. B (Spain), vol.79, no.2, p.77-81 (May-Aug. 1983). [received: Oct. 1983]
A study of the mechanical, magnetic and magnetoelastic behaviour of plastically strained polycrystalline Ni (99.99% purity) is reported. The inverse Wiedemann effect gives a good characterization of the magnetic anisotropy induced by plastic torsion, which has been explained as a consequence of helically distributed residual stresses localized near the wire surface. (15 refs.)

119888 Changes in the remanent magnetisation, magnetoelastic coupling and Young's modulus during structural relaxation of an amorphous ribbon. A.Hernando (Lab. of Magnetism, Univ. Complutense, Madrid, Spain), A.Garcia-Escorial, E.Ascasibar, M.Vazquez.
J. Phys. D (GB), vol.16, no.10, p.1999-2010 (14 Oct. 1983).
The kinetics of structural relaxation have been studied in the amorphous alloy $Fe_{40}Ni_{40}P_{14}B_6$ over the temperature range 230-380°C, by the analysis of the magnetoelastic coupling coefficient, Young's modulus and remanent magnetisation. Measurements provide evidence that different mechanisms should be considered in order to explain the observed behaviour. The results are discussed in terms of different theoretical relaxation models previously reported. Comparison of relaxation data with those predicted from models based on an activation energy spectrum shows an overall consistency. (22 refs.)

119889 The influence of cold-working on magnetic properties in Ni_3Al. S.Takahashi (Faculty of Engng., Iwate Univ., Morioka, Japan), K.Ikeda.
J. Phys. F (GB), vol.13, no.10, p.2169-74 (Oct. 1983).
The application of cold-working causes a remarkable reduction in the magnetisation of the intermetallic Ni_3Al compound. The cold-working effect is explained in terms of the dislocation theory with consideration of the ferromagnetic and paramagnetic interactions of Ni atoms. The magnetisation at 0K decreases in proportion to the dislocation density in the early stage of plastic deformation and to the square root of it in the advanced stage. (7 refs.)

119890 ^{57}Fe Mossbauer effect evidence for magnetostruction in UFe_2. T.K.McGuire, R.H.Herber (Dept. of Chem., Rutgers Univ., New Brunswick, NJ, USA).
Solid State Commun. (USA), vol.48, no.4, p.393-5 (Oct. 1983).
Temperature dependent ^{57}Fe Mossbauer experiments on UFe_2 have shown that above T_c (158K) the logarithm of the recoil-free fraction is a linear function of temperature, with $\theta_M = 325K$. Below T_c there is a non-linear increase in f which is interpreted in terms of a reduction in the mean square amplitude of the iron atom motion assoctiated with magnetostricion of the unit cell. (15 refs.)

119891 The magnetic and magnetoelastic properties of amorphous metallic ribbons. R.Grossinger, H.Sassik, C.Schotzko, A.Veider (Inst. of Experimental Phys., Tech. Univ. of Vienna, Wien, Austria).
Z. Metallkd. (Germany), vol.74, no.9, p.577-84 (Sept. 1983).
Magnetic (hysteresis) and magnetoelastic (*E*-modulus, Δ*E*-effect, magnetostriction, thermal expansion) measuring methods developed for amorphous ribbons are surveyed. Examples of results especially obtained from $Fe_{40}Ni_{40}B_{20}$ are given. The data are discussed with respect to the general aspects of these experiments as well as to varying producing conditions of a conventional melt spinning technique. (36 refs.)

76.00 MAGNETIC RESONANCES AND RELAXATION IN CONDENSED MATTER; MÖSSBAUER EFFECT

(for measurement techniques, see 07.58)

76.20 GENERAL THEORY OF RESONANCES AND RELAXATION

119892 Magnetic resonance in a solid subjected to a nonmonochromatic saturating field. M.I.Rodak (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.500-2 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.874-7 (March 1983). [received: Oct. 1983]
The field causing saturation in magnetic resonance is usually assumed to be monochromatic at a frequency $\omega = \omega_0 + \Delta$, where ω_0 is the center of the magnetic resonance line ρ_0 (Δ). Only special cases of deviations from monochromatic behavior have been considered, i.e. the case of fast modulation of the field and the case of two stationary fields. The author treats the general case of nonmonochromatic fields. The approach is based on the approximation of Goldman (1970) and others. It corresponds to a simple superposition of the actions of fields of different frequencies. (7 refs.)

76.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

119893 Spin dynamics and soliton motion in trans-$(CH)_x$. M.Nechtschein, F.Devreux, F.Genoud, M.Guglielmi, K.Holczer (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.209-16 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Magnetic resonance data in undoped trans-$(CH)_x$, including nuclear and electron relaxation times (T_1, and T_{1e}), ESR linewidth, and dynamic nuclear polarization are reviewed and analyzed. The results are comprehensively

explained in terms of highly one dimensional diffusive spins, the properties of which are consistent with the soliton picture, provided that trapping effects are taken into account. At a given temperature, the population of the spins in the trapped state depends on two parameters: the trap-site concentration and the trapping energy. These parameters are evaluated from the temperature dependence of both the ESR linewidth and T_1. The authors also give experimental determination of the diffusion coefficient as a function of temperature and of the soliton extension. (21 refs.)

119894 Magnetic properties. I. Electronic T_2 and T_1 in undoped $(CH)_x$ and $(CD)_x$. N.S.Shiren (Univ. of Lancaster, Lancaster, England), Y.Tomkiewicz, H.Thomann, L.Dalton, T.C.Clarke.
J. Phys. Colloq. (France), vol.44, no.C-3, p.223-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have measured the magnitude and temperature dependences of T_{2e} and T_{1e} in undoped polyacetylene. The T_{2e} measurements and the determination of soliton diffusion rates from them are summarised. New T_{1e} measurements on $(CD)_x$ and $(CH)_x$ at 9.5 GHz and 16.7 GHz are presented. These measurements are utilised to compute nuclear spin relaxation times, T_{1p}, via the mechanism of nuclear spin diffusion to fixed paramagnetic impurities. It is shown that the results of this calculation agree with published NMR measurements at least as well as does the soliton diffusion model. (8 refs.)

119895 Electron spin motion in trans-$(CH)_x$. W.G.Clark, K.Glover, G.Mozurkewich, C.T.Murayama, J.Sanny, S.Etemad, M.Maxfield (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.239-45 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Electron and nuclear magnetic relaxation measurements are reported for undoped trans-$(CH)_x$ between 0.035K and 300K. They are interpreted in terms of the translational and orientational motion of the electron spins. Evidence is presented to show that previously reported large soliton diffusion constants are incorrect. (19 refs.)

119896 ESR and conductivity studies of doped polyacetylene. D.Davidov, S.Roth (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany), W.Neumann.
J. Phys. Colloq. (France), vol.44, no.C-3, p.295-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The temperature, doping and microwave power dependence of ESR spectra of polyacetylene doped with AsF_5 or SbF_5 is studied. Coexistence of two types of spins is found in all but the most heavily doped samples. The superimposed ESR lines differ in shape and width, temperature dependence and relaxation time. They are attributed to localized and itinerant spins, respectively. These results are indicative of sample inhomogeneities (at least on a microscopic level). (9 refs.)

119897 Distribution of spin density in undoped $(CH)_x$. S.Kuroda (Electrotech. Lab., Ibaraki, Japan), M.Tokumoto, N.Kinoshita, T.Ishiguro, H.Shirakawa.
J. Phys. Colloq. (France), vol.44, no.C-3, p.303-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
ESR spectra of immobile solitons in undoped polyacetylene were computer simulated using theoretical spin densities and the anisotropic hyperfine interaction of π-electron. Simulated results were consistent with observed spectra of cis-rich sample when the spin densities derived for finite on-site Coulomb energy were used. (12 refs.)

119898 ESR study during the electrochemical n-type doping of $(CH)_x$. P.Bernier, A.El-Khodary, F.Rachdi (Groupe de Dynamique des Phases Condensees, Univ. de Sci. et Technol. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.307-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors present and discuss some preliminary results concerning the EPR study during the electrochemical Li^+ doping of cis rich (CH_x) films. With low doping levels ($<10^{-3}$ molar) they observe a continuous decrease of the unpaired electrons number while the EPR linewidth does not change. These results are interpreted in term of preferential doping of the trans parts of the polymer. (5 refs.)

119899 An in situ EPR study of electrochemically doped trans polyacetylene. L.D.Kispert (Chem. Dept., Univ. of Alabama, Tuscaloosa, AL, USA), J.Joseph, T.V.Jayaraman, L.W.Shacklette, R.H.Baughman.
J. Phys. Colloq. (France), vol.44, no.C-3, p.317-20 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
An in situ EPR study has been carried out during repeated charge/discharge cycles of a battery consisting of trans polyacetylene (PA) as the cathode and Li/Al alloy as the anode. The detected spin concentration reversibly ratio decreased with each repeated cycle for ClO_{4-} in ratio decreased with each repeated cycle for ClO_4^- in propylene carbonate and BF_4^- in sulfolane as the dopants. While this decreasing A/B ratio is consistent with decreasing conductivity in the doped state, the observed invariance of ESR linewidth before and after doping suggests that massive disruption of chain conjugation does not occur during battery cycling. (8 refs.)

119900 Formation of fixed paramagnetic solitons in a polyacetylene analogue polymer matrix: ESR studies in thermally decomposed PVC. G.Vancso, T.T.Nagy, B.Turcsanyi, T.Kelen, F.Tudos (Central Res. Inst. for Chem., Hungarian Acad. of Sci., Budapest, Hungary).
J. Phys. Colloq. (France), vol.44, no.C-3, p.701-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors present experimental results concerning estimation of SSH paramagnetic soliton width in a polyacetylene analogue polymer. (10 refs.)

119901 Excited triplet state EPR of sigma-bonded TCNQ dimers in $[Cu(DMP)_2]_2[TCNQ]_2$. W.E.Hatfield, S.K.Hoffmann, P.J.Corvan, P.Singh, C.N.Sethulekshmi, R.M.Metzger (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1377-80 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
$[Cu(DMP)_2]_2[TCNQ]_2$ contains chains of sigma-bonded dianionic dimers of TCNQ, $[TCNQ]_2^{--}$, with low interdimer overlap. Thermal excitation (E_a=0.55 eV) breaks this long (1.630(13) Å) and weak bond. The resultant two $TCNQ^-$ radicals (S=1 state) yield a Frenkel triplet spin exciton spectrum, whose fine structure parameters are well accounted for by a theoretical calculation. Exciton motion is sufficient to eliminate the hyperfine structure. (17 refs.)

119902 Photogeneration of solitons in trans-$(CH)_x$: the reversed spin-charge relation of the photoexcitations. J.D.Flood, A.J.Heeger (Inst. for Polymers & Organic Solids, Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2356-60 (1 Sept. 1983).
High-sensitivity ESR studies of trans-$(CH)_x$ have been carried out during photoexcitation with $\hbar\omega > E_g$. The results set an upper limit on the number of photoinduced unpaired spins, which is more than two orders of magnitude smaller than the number of charged excitations photogenerated under the same experimental conditions. The authors conclude that the charged photoexcitations are spinless and therefore have the reversed spin-charge relation of solitons. The photogeneration branching ratio, neutral solitons to charged solitons, is less than 10^{-2}. (35 refs.)

76.30D Ions and impurities: general

119903 The ESR linewidth of dilute solid solutions. R.S.de Biasi, A.A.R.Fernandes (Centro de Pesquisa de Materiais, Inst. Militar de Engenharia, Rio de Janeiro, Brazil).
J. Phys. C (GB), vol.16, no.28, p.5481-9 (10 Oct. 1983).
A theoretical study of the broadening of magnetic resonance lines due to the dipole interaction in dilute solid solutions of paramagnetic impurities in diamagnetic hosts is presented. The theory takes into account the exchange interaction between impurity ions. Detailed results are presented for the three cubic lattices. The theoretical results are compared with experimental data on Cr^{3+}:MgO powders. (15 refs.)

76.30F Iron group (3d) ions and impurities (Ti-Cu)

119904 The isotropic hyperfine interaction in ternary complexes of copper(II) with 8-hydroxyquinoline and various salicyclic acids. Y.Anjaneyulu, N.V.S.Rao, R.Y.Swamy, R.P.Rao, V.G.K.M.Pisipati (Nagarjuna Univ., Nagarjunanagar, India).
Can. J. Chem. (Canada), vol.61, no.9, p.2154-8 (Sept. 1983).
Electron spin resonance and optical absorption studies are carried out on bis(8-hydroxyquinolinato)copper(II) and seven ternary copper(II) complexes with 8-hydroxyquinoline and salicylic acid or substituted salicylic acids. Electron spin resonance spectra of all these complexes give well-resolved lines. An unusual splitting of the parallel lines in frozen solution spectra and four line fluid (DMF) solution spectra at room temperature are observed. It is explained on the basis of either partial dissociation of 8-hydroxyquinoline ligand or the solvation effect of DMF which solvates some copper chelate molecules even at room temperature. This is more prominent on the parallel lines in frozen solution spectra of all the ternary complexes. The molecular orbital coefficients are estimated assuming an axial symmetry and these indicate that the in-plane π bonding is weak compared to σ-bond in the ternary complexes. The value of χ, which is proportional to hyperfine constants, indicates that it is quite independent of either ligand substitutions or substitutions in the ligand, but purely depends upon the immediate environment which constitutes the coordination around the paramagnetic ion. (16 refs.)

119905 Paramagnetic resonance and optical absorption of Co^{4+} in $SrTiO_3$. K.W.Blazey, K.A.Muller (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
J. Phys. C (GB), vol.16, no.28, p.5491-502 (10 Oct. 1983).
The paramagnetic resonance of low-spin Co^{4+}, $3d^5$ in the oxygen octahedral coordination of $SrTiO_3$ at 4.2K is reported. The spectrum is described by a spin-Hamiltonian with $S={}^1/_2, |\bar{g}|=|g_\parallel+2g_\perp|/3=1.7414\pm0.0015$, and a large hyperfine interaction constant $|A|=|A_\parallel+2A_\perp|/3=254\pm8\times10^{-4}$ cm^{-1}. Correlated with this centre is an optical absorption band at 2.53 eV. This band is attributed to electron-acceptor charge transfer from the oxygen 2p valence states to the $t_{2g}(\downarrow)$ levels of the Co^{4+}. The EPR and optical results are analysed using theoretical expressions due to Thornley (1968), from which

an orbital reduction factor of $k=0.64\pm0.04$ and an average radial electron distribution, $\langle r^{-3}\rangle$, reduced by a factor 0.67 ± 0.06 with respect to the free ion are derived. These significant reduction factors appear to be partly due to a weak dynamic Jahn-Teller effect. The slight tetragonality of the spectrum is a measure of the coupling, $p_2/\mu_e=|g_{\perp}\text{-}g_{\parallel}|/3\epsilon=2.14\times10^2$, to the intrinsic tetragonal distortion of the crystal. The charge linewidth anisotropy is also accounted for by this coupling to E_g random strains with a distribution $\alpha=126$ kg cm^{-2}. (28 refs.)

119906 Optical and ESR investigations of lanthanum aluminates $LaMg_{1-x}Mn_xAl_{11}O_{19}$ single crystals with magnetoplumbite-like structure. F.Laville, D.Gourier, A.M.Lejus, D.Vivien (ENSCP, Paris, France).
J. Solid State Chem. (USA), vol.49, no.2, p.180-7 (Sept. 1983).
New lanthanum aluminates $LaMAl_{11}O_{19}$ (M^{2+}=Ni, Co, Mn, $Mg_{1-x}Mn_x$, $0\leq x\leq1$), with magnetoplumbite-like structure have been obtained as single crystals. This paper is particularly devoted to the Mn^{2+} and Mg^{2+}/Mn^{2+} mixed compounds, which exhibit promising luminescent properties. Several characteristics of the crystals are given. The absorption spectra of the materials, as grown, are assigned to Mn^{2+} ions in tetrahedral sites. After annealing in air new absorptions attributed to octahedral Mn^{3+} ions, appear. The ESR spectra of Mn^{2+} ions in all these crystals exhibit axial symmetry. For $x\leq0.25$ they arise from isolated Mn^{2+} ions in slightly distorted tetrahedral sites and reveal a strong disorder effect. For $x\geq0.5$ the spectra consist of a single line, attributed to clusters of magnetically interacting Mn^{2+} ions. (29 refs.)

119907 Interchain interactions in the highly one dimensional tetraethyl ammonium bis(maleonitrile dithiolato) nickelate, NEt_4 Ni mnt_2. B.L.Ramakrishna, P.T.Manoharan (Dept. of Chem., Indian Inst. of Technol., Madras, India).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1405-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
'Magnetic dilution' achieved through strong antiferromagnetic interchain exchange leads to sharp lines in EPR, which enables the resolution of extremely small fine structural details. These have been shown to be due to interchain dipolar interactions which are modulated by weak interchain exchange coupling. (5 refs.)

119908 Paramagnetic impurity centers in single crystals of synthetic xenotime. M.V.Samatov, S.L.Votyakov, A.A.Krasnobaev (A.N. Zavaritskii Inst. of Geology & Geochem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1604-6 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1866-8 (Nov. 1982).
Single crystals of xenotime have been synthesized from Y_2O_3 solution in a melt of the system $Na_4P_2O_7$-MoO_3. Their EPR spectra have been investigated in the X and Q bands. The radiation-induced paramagnetic centers Zr^{3+} and Hf^{3+} are found and interpreted, and their temperature stability is studied. They are compared with analogous centers in zircon. It is shown that there is a difference in the interaction of the $4d^1$ and $5d^1$ configurations with the crystal fields of the isostructural compounds xenotime and zircon. (8 refs.)

119909 EPR and ionic thermocurrents experiments on cubic solid solutions $Sr_{1-x}Eu_xF_{2+x}$. H.W.den Hartog (Solid State Phys. Lab., Univ. of Groningen, Groningen, Netherlands), R.Nakata.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3110-21 (Sept. 1983).
The authors report the results of EPR and ionic thermocurrents (ITC) experiments on cubic solid solutions of the type $Sr_{1-x}Eu_xF_{2+x}$. A part of the Eu-ions is in the divalent state; these ions can be detected easily with EPR. From the EPR results they conclude that for $0\leq x\leq0.115$ the long range order is still cubic and the lattice parameter does not vary appreciably. The interactions between distant Eu^{3+}-F_1^- dipoles and the Eu^{2+} probes is estimated; from this the authors conclude that for $x\gtrsim0.044$ clustering of trivalent Eu-ions cannot be excluded. The ITC results are in line with those obtained from EPR. In addition they note that for small values of x nearest neighhor (NN) Eu^{3+}-F_1^- complexes are the dominant defects. For $x>5\times10^{-3}$ NNN dipoles are present also. Apart from the reorientation bands associated with the above-mentioned defects they observe with ITC a depolarization peak, ascribed to space charge phenomena. The behavior of the dipole peaks and the space charge peak is discussed together with the conduction processes in concentrated solid solutions of $Sr_{1-x}Eu_xF_{2+x}$. (31 refs.)

119910 Different kinds of Tl^{2+} charge compensation in thallium doped KH_2PO_4 and KD_2PO_4 crystals. L.V.Gonzaga, J.F.Sampaio, G.M.Ribeiro, R.Gazzinelli, A.S.Chaves (Dept. of Phys., Univ. Federal de Minas Gerais, Belo Horizonte, Brazil).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3215-18 (Sept. 1983).
Three different kinds of charge compensation for Tl^{2+} are observed in the paraelectric phase of heavily doped KH_2PO_4 and KD_2PO_4. The EPR spectra of two of these paramagnetic centers, not yet reported in the literature, are studied and possible models for the charge compensation are proposed.

119911 ESR study of oxygen trapping in trans-$(CH)_x$. F.Genoud, F.Devreux, M.Nechtschein, J.P.Travers (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.291-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Studies the kinetics of oxygen adsorption in trans-$(CH)_x$ by following the decrease of the spin number as measured by ESR as a function of oxygen pressure and temperature. (3 refs.)

119912 Magnetic resonance studies on iodine doping of polyacetylene. M.Tokumoto, N.Kinoshita, S.Kuroda, T.Ishiguro (Electrotech. Lab., Ibaraki, Japan), H.Shirakawa, H.Nemoto.
J. Phys. Colloq. (France), vol.44, no.C-3, p.299-302 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The effect of iodine doping on the spin concentration of trans-$(CH)_x$ was studied at various doping levels monitored by the conductivity increase. Competition between two types of soliton doping mechanism was found to vary with iodine concentration. (4 refs.)

119913 Electron spin echo determination of spin diffusion in the one-dimensional conductor $(\text{fluoranthenyl})_2{}^+(PF_6)_x{}^-(SbF_6)_{1-x}{}^-(x\approx0.5)$. J.Sigg, Th.Prisner, K.P.Dinse, H.Brunner, D.Schweitzer, K.H.Hausser (Max-Planck-Inst., Heidelberg, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1421-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
From the electron spin echo decay function of $(Fa_2)^+X^-$ a ratio of $5.10^6\leq D_{\parallel}/D_{\perp}\leq5.10^8$ for the inner stack to out-of-stack diffusion rates was determined. The deduced value of $2.10^{13}\leq D_{\parallel}\leq2.10^{16}$ rad s^{-1} is consistent with the bulk DC-conductivity of $\sigma=10$-100 $(\Omega\text{cm})^{-1}$. (10 refs.)

119914 Structure and kinetics of some paramagnetic oxygen centres in synthetic calcium fluoride crystals. W.Karthe, H.-J.Fuchs (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.125-32 (1983). In English.
Structure and kinetics of several oxygen centres in synthetic calcium fluoride crystals were investigated by means of electron paramagnetic resonance (EPR) and electron nuclear double resonance (ENDOR). In crystals doped with manganese or yttrium ions was studied the conversion of paramagnetic centres as consequence of additional oxygen doping. The type of metal-oxygen centre depends on the conversion conditions (temperature air pressure during temperature treatment). The kinetics was investigated after X-irradiation, thermal and optical bleaching of the centres. In undoped CaF_2 crystals oxygen centres were generated by a diffusion process in air and by subsequent X-irradiation. At 77K the X-irradiation generates V_K-type centres stabilized by oxygen. These V_K-type centres are destroyed at 150K and an oxygen-fluorine vacancy centre occurs. At room temperature this centre is generated directly by X-irradiation. The kinetics of the centre was studied. A model is suggested. The diffusion profile of oxygen in CaF_2 was determined from the distribution of these centres. The activation energy for the oxygen diffusion amounts to $E_A\approx1.8$ eV. The diffusion processes in the crystals doped with metal ions were found to be different from diffusion in undoped crystals. (22 refs.)

119915 ESR of electron-excess centres in X-irradiated $3CdSO_4.8H_2O$ and $(NH_4)_2SO_4$:Cd crystals. C.S.Sunandana (School of Phys., Univ. of Hyderabad, Hyderabad, India), C.Ramasastry.
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.781-5 (1983).
An ESR study of X-irradiated $3CdSO_4.8H_2O$ and cadmium-doped $(NH_4)_2SO_4$ single crystals at 300K has revealed the presence of an electron-excess centre, trapped at two physically inequivalent sites in the former and at a single site in the latter. The nature of this centre is discussed with the aid of optical spectra. Also, other hole-type centres are characterized in the two systems. (18 refs.)

J. Phys. Colloq. (France), vol.44, no.C-3, p.757-60 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
ESR spectra of $FeCl_3$-doped $(C_6H_4)_x$ have been studied. The concentration of Curie-law spins, T-dependence of the linewidth and a shift in the g-factor due to doping are accounted for by polaron and bipolaron formation in doped samples. In heavily doped material high Fe^{3+} spin densities with broad linewidths were found. (10 refs.)

76.40 DIAMAGNETIC AND CYCLOTRON RESONANCES

119917 Cyclotron anomaly in 2-D conductors. A.Ishihara, M.Mukai (Dept. of Phys., State Univ. of New York, Buffalo, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1449-52 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
In agreement with recent experiments, the authors show theoretically that the filling factor, rather than the density itself, plays a crucial role for characterizing cyclotron resonance of 2-D conductors. They explain anomalous line broadening and shifting of the absorption line that cannot be explained in terms of single electron theory. (7 refs.)

119918 Shifted cyclotron resonance in $NbSe_3$. R.J.Wagner, N.P.Ong (Naval Res. Lab., Washington, DC, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1697-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The cyclotron resonance of free carriers in $NbSe_3$ at 2K has been observed at far infrared frequencies. The effective masses of the two bands are 0.18 and 0.71 times the free mass. A shifted resonance is seen when the electric field polarisation is perpendicular to the chain axis. The authors suggest that this is due to coupling between the free carriers and the pinned Froehlich mode. (3 refs.)

119919 Bistable cyclotron resonance in semiconductors. A.Elci (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA), A.E.Kaplan.
Phys. Lett. A (Netherlands), vol.97A, no.7, p.305-8 (12 Sept. 1983).
The authors consider the cyclotron resonance in a semiconductor which has a band with a relativistic energy-momentum dispersion and show that, when subject to quasiresonant radiation, the energy of a free carrier in this band and the relative potential drop between the two surfaces of the semiconductor facing the radiation exhibit bistability under classical single electron approximation. (14 refs.)

119920 Nonlinear effects in bismuth under cyclotron resonance conditions. V.S.Edel'man (Inst. of Phys. Problems, Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1343-4 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2317-19 (Dec. 1982). [received: Oct. 1983]
It is shown that the magnetic-field dependence of the power of a double-frequency (2ω) signal generated when bismuth crystals are irradiated by an intense monochromatic signal of frequency ω, observed by Gantmakher et al. (ibid., vol.55, p.921, 1982), can be ascribed to the dependence of the impedance Z_ω on the magnetic field strength. (8 refs.)

(see also 75.30D Spin waves)

119921 Properties of ferrimagnetic echoes in yttrium iron garnet cylinders. F.Bucholtz, D.C.Webb (Electronics Technol. Div., Naval Res. Lab., Washington, DC, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5331-8 (Sept. 1983).
The first detailed study of the properties of ferrimagnetic echoes in cylinders of yttrium iron garnet has been performed. Data are presented showing the dependence of the echo on applied field H_a, pulse separation τ, signal pulse power P_s, and pump pulse power P_p. At a given frequency, echoes are found to occur in multiple, well-defined regions of the parameters τ and H_a. For low P_s and P_p, the echo power P_e increases linearly with increasing P_s but increases very rapidly with increasing P_p, following $P_e \sim {P_p}^{4.5}$. P_e saturates at high power levels with the saturation level depending on both P_s and P_p. Additional experimental observations, which give further insight into the excitation and evolution of the echo, are also presented. Experimental results verify some of the qualitative predictions of various models previously proposed for the ferrimagnetic echo process but also point out some of the limitations of these models. (23 refs.)

76.60 NUCLEAR MAGNETIC RESONANCE AND RELAXATION

119922 Heteronuclear correlation spectroscopy in rotating solids. P.Caravatti, L.Braunschweiler, R.R.Ernst (Lab. fur Phys. Chem., Eidgenossische Tech. Hochschule, Zurich, Switzerland).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.305-10 (16 Sept. 1983).
Coherence transfer by an isotropic mixing process is used for two-dimensional heteronuclear shift correlation in magic-angle-spinning solid-state spectroscopy. Selective coherence transfer is combined with efficient homonuclear and heteronuclear dipolar decoupling to obtain well-resolved shift correlation spectra. (21 refs.)

119923 ^{13}C NMR of crystalline morphine. J.G.Hexem, M.H.Frey, S.J.Opella (Dept. of Chem., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5717-19 (7 Sept. 1983).
The high-resolution ^{13}C NMR spectrum of crystalline morphine obtained with magic angle sample spinning and proton decoupling has resolved resonances from each of the 17 carbon atoms in the molecule. Four of these resonances are split into doublets. The three asymmetric doublets arising from the three carbons bonded to the ^{14}N of the molecule enabled the determination of a value of -1.5 MHz for the nitrogen quadrupole coupling constant. The resonance from C15 is split nearly symmetrically, suggesting that this site exists in two environments. (24 refs.)

119924 Deuteron magnetic resonance study of single crystals of $NaDSeO_3$. I.S.Vinogradova (L.V. Kirensky Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
J. Solid State Chem. (USA), vol.49, no.2, p.129-33 (Sept. 1983).
A deuteron magnetic resonance study of a single crystal of $NaDSeO_3$ at room temperature is reported. The observed electric field gradient tensors correspond to two nonequivalent hydrogen bonds. The quadrupole coupling constants (eQq/h) and asymmetry parameters (η) are found to be 172.8 and 0.07 kHz for D(1), and 152.5 and 0.08 kHz for D(2). D(2) are ordered, but D(1) are found to be dynamically disordered. The DMR results are consistent with recent X-ray reinvestigation. No phase transitions have been encountered in the temperature range 336 to 77K. (9 refs.)

119925 High resolution NMR and time resolved ESR on polyacetylene. M.Mehring (Phys. Inst. 2, Univ. Stuttgart, Stuttgart, Germany), H.Seidel, H.Weber, G.Wegner.
J. Phys. Colloq. (France), vol.44, no.C-3, p.217-22 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Time resolved ESR (spin-echo, saturation recovery) and NMR (magic angle sample spinning, cross polarization and magic echo) experiments are reported on polyacetylene. Three different types of defects were identified: mobile spins (neutral solitons), fixed distributed spins (pinned solitons or polarons) and chain defects. (16 refs.)

119926 ^{13}C NMR studies of iodine doped polyacetylene. I.Heinmaa (Inst. of Chem. Phys. & Biophys., Acad. of Sci., Tallinn, USSR), M.Alla, A.Vainrub, E.Lippmaa, M.L.Khidekel, A.I.Kotov, G.I.Kozub.
J. Phys. Colloq. (France), vol.44, no.C-3, p.357-10 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Natural abundance ^{13}C NMR experiments using cross-polarization and magic angle spinning are reported for cis- and trans-polyacetylene as a function of iodine doping level. Two new signals appearing on doping are attributed to the formation of spinless charged solitons and the chemical addition of iodine to double bonds. Substantial cis/trans isomerization does not occur even at high iodine doping levels. (13 refs.)

119927 Nutation NMR studies of polyacetylene. T.C.Clarke, R.D.Kendrick, C.S.Yannoni (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.369-72 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Using nutation NMR spectroscopy the authors have been able to determine directly the carbon-carbon bond lengths in polyacetylene. For trans-polyacetylene they find double and single bond lengths of 1.36 and 1.44 Å respectively; the double bond in cis-polyacetylene is found to be 1.38 Å. Interestingly, at 77K they do not observe a rapid interchange of the single and double bonds in trans-polyacetylene in the manner predicted for chains containing a soliton defect, suggesting that the majority of the carbons in the trans isomer are on conjugated segments which do not contain such mobile species. (13 refs.)

119928 ^{93}Nb NMR study of $NbSe_3$. F.Devreux (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1665 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
High field NMR measurements provide new and detailed information on the electronic structure of $NbSe_3$. (no refs.)

119929 ^2H-NMR spectral patterns in magneto-aligned smectic E and G phases. R.Y.Dong, H.Schmiedel, N.A.P.Vaz, Z.Yaniv, M.E.Neubert, J.W.Doane (Dept. of Phys., Kent State Univ., Kent, OH, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.411-24 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Unique ^2H-NMR spectral patterns can be obtained from biaxially ordered smectic *E* and *G* phases, where only one director of the phase is aligned by the magnetic field. Two effects on the shape of the deuterium spectral pattern are demonstrated: (1) The effect of a motionally induced asymmetry parameter in the time averaged deuterium quadrupole interaction, and (2) the effect when the principal *z*-axis of the time averaged interaction is not parallel to the aligned director. Spectral patterns for the S_G phase of the compound 4-*n*-pentoxybenzylidene-4-*n*′-heptylaniline selectively deuterated on one of the aromatic rings (5o.7-d_4) were obtained for both unaligned and magneto-aligned samples. Spectral patterns were also recorded for the S_E phase in magneto-aligned samples of the mixture of compounds 4-cyano-4′-octyloxybiphenyl (8oCB) with 50 wt.% 4o.8-d_4. Models for the smectic *E* and *G* phases based on these observations are discussed. (15 refs.)

119930 High resolution solid state ^{13}C NMR of butadiene grafted polypropylene. P.F.Barron, W.K.Busfield, T.Morley-Buchanan (School of Sci., Griffith Univ., Nathan, Queensland, Australia).
Polymer (GB), vol.24, no.10, p.1252-4 (Oct. 1983).
^1H dipolar decoupled ^{13}C NMR experiments with the aid of the magic angle spinning technique have been used to determine the graft content and the isomer content of the polybutadiene grafts in a graft copolymer with isotactic polypropylene. (5 refs.)

119931 Local boron environment in $Ni_{100-x}B_x$ metallic glasses: an NMR study. P.Panissod, I.Bakonyi (Univ. Louis Pasteur, Strasbourg, France), R.Hasegawa.
Phys. Rev. B (USA), vol.28, no.5, p.2374-81 (1 Sept. 1983).
From the analysis of the ^{11}B NMR spectra in *a*-$Ni_{100-x}B_x$ ($18.5 \leq x \leq 40$) the electric-field-gradient (EFG) components on the B sites and their distributions are deduced, giving an insight into the local atomic arrangements. For $x=18.5$ and 40, one finds relatively narrow distributions of the EFG components, indicating weak fluctuations of the bonding angles, distances, and

nature of the atoms in the B coordination shell. The comparison with the compositionally closest nickel borides (Ni_3B and Ni_4B_3) immediately suggests that the local structure around B is similar in these glasses and in the related crystals, i.e. nickel trigonal prisms (6 Ni) whose rectangular faces are capped by 3 Ni (Ni_3B) or 3 Ni and/or B (Ni_4B_3). For intermediate concentrations the EFG component distributions are found significantly broader and comparable with those expected from random packing of spheres. However, the continuous evolution of the NMR spectra shape with increasing B content rather suggests an admixture of c-Ni_3B-like and c-Ni_4B_3-like B local environment; i.e. when B concentration increases, more prisms share rectangular faces allowing boron-boron contact as in c-Ni_4B_3. No sign of a B coordination shell similar to that in c-Ni_2B (8 Ni anticubes+2 B) is found in the glasses. Measurements of transverse relaxation times T_2, which reflect essentially the B-B bondings, qualitatively support these conclusions. (11 refs.)

119932 Change in the profile of the free induction signal during establishment of a spin temperature. A.S.Maslennikov, R.A.Dautov, Yu.L.Popov, V.S.Skrebnev (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.419-21 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.734-7 (March 1983). [received: Oct. 1983]
During the time of establishment of a spin temperature in a rotating system of coordinates, a change in the profile of the free induction signal of nuclear spins was observed after a weak RF field had been switched off. Such a change in the profile during short times of the evolution of the system in a rotating system of coordinates is explained using an expansion of the solution of the Liouville equation for the density matrix in powers of a small parameter. The behavior of the system after a long time (when an internal equilibrium is reached) is described well by a spin temperature model. (8 refs.)

119933 Magnetic susceptibility and ^{19}F nuclear magnetic resonance in nickel trifluoride. A.M.Panich, V.N.Ikorskii, A.A.Artyukhov (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.518-19 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.901-3 (March 1983). [received: Oct. 1983]
The authors have used the method of static magnetic susceptibility and of the NMR spectrum of ^{19}F to study the behavior of NiF_3, which is a new member of the group of compounds with the formula MF_3 and with formally the d^7 configuration of the paramagnetic nickel ion; they explain why this compound does not exhibit magnetic ordering right down to temperatures of about 1K. (12 refs.)

119934 Dispersion of proton spin-lattice relaxation in a cholesteric liquid crystal. M.Vilfan, R.Blinc, J.Dolinsek, M.Ipavec, G.Lahajnar, S.Zumer (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia).
J. Phys. (France), vol.44, no.10, p.1179-84 (Oct. 1983).
The frequency and temperature dependence of T_1 and T_{1p} in the cholesteric and isotropic phases of cholesteryl-oleyl-carbonate (COC) have been determined together with the temperature dependence of the self-diffusion constant D in the isotropic phase. In the MHz region the relaxation is dominated by molecular self-diffusion-with D being of the order 10^{-12} m^2/s—and by local molecular rotations with $\tau_c \approx 2\times10^{-10}$ s at $T=24°C$. In the kHz region, on the other hand, order director fluctuations predominantly influence the relaxation. The influence upon T_{1p} of the rotation of the molecules caused by their diffusion along the helix, an effect occurring only for twisted structures, was not observed in COC in view of too long a rotational correlation time. (20 refs.)

119935 Frequency and temperature dependence of ^1H NMR of trans-(CH)$_x$. P.E.Sokol (Ohio State Univ., Columbus, OH, USA), J.R.Gaines, S.I.Cho, D.B.Tanner, H.W.Gibson, A.J.Epstein.
J. Phys. Colloq. (France), vol.44, no.C-3, p.349-52 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have carried out a study of the temperature ($0.3K<T<4.2K$) and frequency ($23\ MHz<f<35\ MHz$) dependence of the proton spin lattice relaxation time, T_1, of trans-$(CH)_x$. The data at 4.2K are in agreement with earlier measurements of Nechtschein et al. (1980). As the sample is cooled, T_1 continues to increase, with $T_1{}^{-1}=\alpha f^{-1}/_2-\beta$, where α and β are temperature dependent quantities. Alternately T_1 is expressed as an activated quantity, $T_1=A\ \exp(-\Delta/T)$, with $\Delta=\gamma H$ (A and γ constant). The observed g-factor of 3.3 for the activation energy suggests that the authors are in the low temperature limit for 1-D nuclear spin diffusion as discussed by Clark et al. (9 refs.)

119936 Temperature dependence of NMR T_1 and χ in Br_3, AsF_6-doped (CH)$_x$. K.Kume (Dept. Phys., Tokyo Metropolitan Univ., Tokyo, Japan), K.Mizuno, K.Mizogauchi, K.Nomura, H.Takayama, S.Ishibara, J.Tanaka, M.Tanaka, H.Fujimoto, H.Shirakawa.
J. Phys. Colloq. (France), vol.44, no.C-3, p.353-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have measured the temperature dependence of proton NMR T_1 and Pauli paramagnetic susceptibility χ_p in Br_3- and AsF_6-doped $(CH)_x$. The microscopic conductivity σ_{NMR} has been calculated from them, and compared with σ_{DC}. (13 refs.)

119937 NMR investigations of native and doped polyacetylene films. M.Ziliox, B.Francois, C.Mathis, B.Meurer, P.Spegt, G.Weill (Centre de Recherches sur les Macromolecules, Strasbourg, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.361-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The results concern the second moment of the proton NMR line and the relaxation time T_1 of protonated, deuterated and ^{13}C enriched polyacetylenes. For the protonated cis and trans samples, progressively doped with iodine or sodium, the changes in the second moment reveal doping induced isomerization and further swelling of the lattice; the T_1 measurements are consistent with a decrease in number and mobility of neutral solitons upon doping. Preliminary results on deuterated and ^{13}C enriched samples show that, whereas proton magnetization recovers in an exponential way, ^2H and ^{13}C relaxations are well fitted by a double exponential function with time constants 1.5 and 8.6 s for the deuterated samples and 0.3 and 1.5 s for ^{13}C nuclei. (5 refs.)

119938 Nuclear magnetic relaxation in polyacetylene. J.C.Scott, T.C.Clarke (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.365-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Nuclear spin-lattice relaxation rates for ^1H and ^{13}C in polyacetylene cannot be adequately explained in terms of either nuclear spin diffusion to a static paramagnetic defect or rapid one-dimensional diffusion of the defect itself. The authors propose a model in which a small fraction of the molecular chains contain defects. Nuclei on these chains are rapidly relaxed, while the remainder achieve equilibrium by nuclear spin diffusion. The dependences of the measured relaxation rates upon frequency and isotropic concentration are in agreement with the predictions of this model. (15 refs.)

119939 Dimensionality in (TMTSF)$_2$PF$_6$. L.J.Azevedo (Sandia Nat. Labs., Albuquerque, NM, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.813-18 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The dimensionality of the spin dynamics in $(TMTSF)_2PF_6$ has been studied in the high pressure metallic phase at low temperature via the field dependence of the nuclear spin-lattice relaxation rate ($T_1{}^{-1}$) of nuclear spins hyperfine coupled to the electron spin. Measurements of the relaxation rate of ^1H, ^{13}C and ^{77}Se over the field range 1-120 kOe establish two regimes. In the high field regime $T_1{}^{-1}$ varies logarithmically with magnetic field indicative of nuclear relaxation to a spin diffusing in two dimensions. Below 12 kOe $T_1{}^{-1}$ is independent of field indicating a crossover to three-dimensional motion. These results conclusively show that in the high pressure metallic phase $(TMTSF)_2PF_6$ is not a quasione-dimensional metal. (11 refs.)

119940 ^1H NMR relaxation studies of the organic conductor series (TMTTF)$_2$X; X=BF$_4$, PF$_6$, SCN. B.Liautard, S.Peytavin, G.Brun (Lab. de Chimie des Materiaux, Univ. des Sci. et Tech. du Languedoc, Montpellier, France), P.Bernier.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1087-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Using standard pulsed NMR at 26 MHz, the authors have studied the temperature dependence ($3.6<T<400K$) of the ^1H nuclear relaxation times T_1 and T_2 of the $(TMTTF)_2X$ systems when $X=BF_4$, PF_6 or SCN. The observed behaviours show typical features of relaxation induced by a coupling with the molecular motion of CH_3 groups on the TMTTF molecules. The occurrence, in some cases, of an electronic antiferromagnetic ordering at low temperature is discussed. (7 refs.)

119941 ^1H-NMR relaxation studies on the nature of the semiconducting state of (TMTTF)$_2$Br and (TMTTF)$_2$PF6: magnetism. T.Takahashi, F.Creuzet, D.Jerome (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France), J.M.Fabre.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1095-7 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The electronic properties of $(TMTTF)_2Br$ and $(TMTTF)_2PF6$ have been studied by ^1H-NMR relaxation measurements. The low temperature semiconducting state in $(TMTTF)_2Br$ is shown to be a SDW state at ambient pressure and at 13 kbar, by the anomalies in T_1, T_2, and $T_2{}^*$. A phase transition is also observed in $(TMTTF)_2PF6$ but the magnetic nature is not so pronounced. It seems likely that the spin and lattice modulations coexist in the low temperature phase of $(TMTTF)_2PF6$. The authors discuss the possible crossover in the low temperature state in $(TMTTF)_2X$ family. (7 refs.)

119942 Crossover from localized to mobile electrons in Qn (TCNQ)$_2$. W.G.Clark, K.Glover, M.D.Lan (Phys. Dept., Univ. of California, Los Angeles, CA, USA), L.J.Azevedo.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1493-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Nuclear spin-lattice relaxation measurements are reported for $Qn(TCNQ)_2$ over the magnetic field range 10 Oe to 120 kOe at temperatures between 4.2K and 100K. They indicate that a crossover from localized to mobile 1-d electrons occurs near 20K. The distance an electron diffuses before confinement by a barrier or jumping to another chain varies from 30 Å at 19K to 155 Å at 100K. The observed behavior is consistent with diffusion among random barriers. (20 refs.)

119943 Two dimensional NMR time evolution correlation spectroscopy in liquid crystals. R.K.Shenoy, C.E.Tarr (Dept. of Phys. & Astron., Univ. of Maine, Orono, ME, USA), T.B.Tripp.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.131-7 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Two dimensional NMR time evolution correlation spectroscopy, where a correlation of NMR relaxation and line-shapes are performed, provides a powerful tool in characterization of systems involving two or more spin groups. This technique is applied to proton NMR study in liquid crystal para-azoxy anisole in the nematic phase at two different frequencies. Two different spin groups corresponding to methyl and phenyl protons are identified, as expected. The methyl proton spin lattice relaxation time shows a greater frequency dependence compared to phenyl protons. (6 refs.)

119944 Proton dipolar spin-lattice relaxation in the smectic phases of TBBA. R.Y.Dong (Dept. of Phys. & Astron., Brandon Univ., Brandon, Manitoba, Canada), J.S.Lewis, E.Tomchuk, J.J.Visintainer, E.Bock.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.139-47 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The proton dipolar spin-lattice relaxation time T_{1D} was measured at several Larmor frequencies in the various smectic phases of the liquid crystal terephthal-bis-butylaniline (TBBA) as a function of temperature and orientation of the sample in an external magnetic field. The angular dependent T_{1D} measurements are used to determine the importance of orientational order director fluctuations (ODF) in the dipolar field of the smectic phases of TBBA. In particular, the $T_{1D}{}^{-1}$ angular dependence in the S_A phase is different from that in the S_C and S_G phases. This contrasts sharply with the $T_1{}^{-1}$ angular dependence in these phases which are all similar. (13 refs.)

119945 Effect of tunnelling on the evolution of nuclear magnetisation. J.Peternelj, M.M.Pintar (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada).
Phys. Rev. B (USA), vol.28, no.5, p.2411-29 (1 Sept. 1983).
The semiclassical perturbation calculation of the nuclear-spin relaxation has been extended to lower temperatures by taking into account the tunnelling splittings of the lowest-energy states of NH_4 tetrahedron embedded in a crystal lattice. The effect of the lattice is represented by classical correlation functions. The proton-spin relaxation has been calculated for large and arbitrary tunnelling splittings in a tetrahedral crystal field, for the case of tunnelling around a single C_3 axis and around C_2 axes only. The cases of large tunnelling splitting in an asymmetric crystal field and in a crystal field with trigonal distortion are also discussed. The effect of tunnelling in a tetrahedral crystal field with a small distortion is examined in detail. It is shown that in a special case the tunnelling-assisted relaxation may be responsible for the establishment of equilibrium in a spin-polarisation-torsional spectroscopy experiment. The presented model calculation is valid at temperatures from ~100 to ~10K, when the correlation-function approximation breaks down. (17 refs.)

119946 NMR measurement of entanglement density in irradiated polyisobutylene. A.Charlesby, B.J.Bridges (Royal Military Coll. of Sci., Swindon, England).
Radiat. Phys. & Chem. (GB), vol.19, no.2, p.155-64 (1982). [received: Oct. 1983]
High molecule weight polyisobutylene shows a T_{2S} relaxation spectrum typical of a highly crosslinked or entangled network. In conformity with theory the reduction of molecular weight by radiation shows a reduction in the T_{2S} (network) fraction $(1-f)$, and an increase in the T_{2L}, (nonnetwork) fraction (f), until the network fraction disappears. The average molecular weight M_e between entangled units at 144°C is 2×10^4; it varies only slightly with temperature, and not significantly with overall molecular weight. The quantity $T_{2L}M_n{}^{-0.5}$ is constant at a fixed temperature T. Its variation with T is similar to that of viscosity. The variation of T_{2L} with molecular weight of molecules in the nonnetwork fraction and of T_{2S} with M_e in the network fraction do not agree with the theory for the two fractions considered separately. This is ascribable in part to their mutual interaction. (9 refs.)

119947 ^{19}F nuclear relaxation study of the fluorite systems: $K_{0.36}Bi_{0.64}F_{2.28}$. J.P.Donoso, H.Panepucci (Dept. de Fisica e Ciencia dos Materiais, Univ. de Sao Paulo, Sao Carlos, Sao Paulo, Brazil), A.Cassanho, H.Guggenheim.
Solid State Commun. (USA), vol.48, no.2, p.95-7 (Oct. 1983).
Measurements of the ^{19}F nuclear relaxation times T_1 and T_2 are reported for the fluorite-structured: $K_{0.36}Bi_{0.64}F_{2.28}$ single crystal, as a function of temperature and frequency. The main features of the experimental results are as follows: (a) the presence of a broad minimum and a highly assymetric shape in the T_1 vs. T^{-1} curve; (b) a strong dependence of T_1 with the nuclear Larmor frequency at low temperatures; and (c) the presence of a minimum of T_2 in the high temperature region. The NMR relaxation data is found to reflect the presence of a distribution of barrier energies for ionic motion characteristic of an inhomogeneous diffusion process. (12 refs.)

76.60G Quadrupole resonance

119948 Central transition NMR excitation spectra of half-integer quadrupole nuclei. A.Samoson, E.Lippmaa (Inst. of Chem. Phys. & Biophys., Acad. of Sci., Tallinn, USSR).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.205-8 (9 Sept. 1983).
A two-dimensional NMR technique for the study of half-integer quadrupole nuclei in powder samples is presented. Central transition excitation spectra provide a useful means for selective determination of the quadrupole interaction parameters in correlation with these of other interactions present. (13 refs.)

119949 First-principles theory of antishielding effects in the nuclear quadrupole interaction in ionic crystals: application to ^{57m}Fe in Fe_2O_3. A.C.Beri, T.Lee, T.P.Das (Dept. of Phys., State Univ. of New York, Albany, NY, USA), R.M.Sternheimer.
Phys. Rev. B (USA), vol.28, no.5, p.2335-51 (1 Sept. 1983).
A first-principles procedure is developed for the quantitative study of the widely differing Sternheimer antishielding effects that can be ascribed to the induced electric field gradients due to the various sources of electric field gradient in ionic crystals. The method involves the perturbation of the electronic states in the crystal by the nuclear quadropole moment of the central ion, and the use of these perturbed functions in an evaluation of components of the energy of the crystal which are linear in the quadropole moment. The authors have applied this ab initio method to a study of the nuclear quadrupole interaction for ^{57}Fe in Fe_2O_3 using a model in which an Fe^{3+} ion is surrounded by six O^{2-} ligands whose charge distributions overlap the Fe^{3+} ion. The application of their procedure to the model of overlapping ions leads to the important conclusion that the field gradients due to the various sources in the central cluster and the surrounding lattice are all subject to very different antishielding effects. The sources involved can be grouped broadly into three classes: local, nonlocal, and distant, with the local sources involving charge densities purely central in character, nonlocal sources involving charge densities composed of one central-ion orbital and one ligand-ion orbital, and the distant sources involving two categories, a distant electronic one composed of charge densities from purely ligand-ion orbitals, and a distant nuclear one, comprising the nuclear charges on the ligand ions (O^{2-}). The effective antishielding factors γ_{eff} associated with these sources were found to be, respectively, -0.2, -0.7, -3.8, and -6.5, all very different from $\gamma_\infty=-9.19$ for the Fe^{3+} ion appropriate a totally external point-charge source and $R=+0.07$, the shielding factor with the field gradient due to the $3d$ valence shell in the Fe^{2+} ion, which have both been used in the past as approximate choices for the various γ_{eff}. The substantial differences between the various effective antishielding factors γ_{eff} found in the present work are explained physically by the consideration of the different degrees of penetration of the charge densities corresponding to the various sources producing the field gradients into the region of the Fe^{3+} ion. (80 refs.)

76.70 MAGNETIC DOUBLE RESONANCES AND CROSS EFFECTS

76.70D Electron-nuclear double resonance (ENDOR)

119950 Magnetic properties. II. ENDOR of undoped cis-$(CH)_x$. L.R.Dalton, H.Thomann, H.Kim (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA), Y.Tomkiewicz, N.S.Shiren, T.C.Clarke.
J. Phys. Colloq. (France), vol.44, no.C-3, p.229-32 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
For pt.I see ibid., vol.44, no.6, p.C3/223. Pristine 99% ^{13}C-enriched cis-polyacetylene has been investigated by electron-nuclear double-resonance (ENDOR) spectroscopy at temperatures between 77 and 300K. Spectra are characterized by two and only two ^{1}H and ^{13}C hyperfine tensors. The relative magnitudes and symmetry of the tensor elements establish that the paramagnetic electron resides in a delocalized orbital. Experimental results indicate that the delocalized electron is constrained to a potential well of approximately 100 Å in width. (4 refs.)

119951 Magnetic properties of polyacetylene composites [ENDOR and electron spin echo studies]. H.Thomann (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA), L.R.Dalton, M.E.Galvin, G.E.Wnek, Y.Tomkiewicz.
J. Phys. Colloq. (France), vol.44, no.C-3, p.313-16 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Composites of low density polyethylene, LDPE, and trans-Polyacetylene, t-$(CH)_x$, prepared by polymerization of acetylene in LDPE films impregnated with a Ziegler-Natta catalyst, have been studied by Electron Nuclear Double Resonance (ENDOR) and Electron Spin Echo (ESE) spectroscopies and the results compared with analogous studies conducted on trans-polyacetylene films. ENDOR measurements indicate that the wavefunction, a highly delocalized pure π-orbital, is essentially the same in composites as in pure polyacetylenes but at a given temperature the electron spin diffusion coefficient is substantially reduced. ESE phase memory times, T_M, measured by a 90°-180° pulse technique exhibited the same general function dependence on temperature; however, T_M times (hence electron spin diffusion correlation times) for the composites were substantially longer at each temperature. These results imply a reduced spin diffusion coefficient and increased activation energy in the composites compared to pure polyacetylene. Phase memory times for the composites appear less sensitive to prolonged exposure to oxygen than is the case for pure polyacetylene; however, prolonged exposure does shorten phase memory times and reduce the 'effective' activation energy for the dynamic process or processes which determines phase relaxation by modulation of the magnetic interactions. (5 refs.)

119952 Two types of F centres in alkaline earth fluoro-halides. II. Double ENDOR experiments. J.R.Niklas, R.U.Bauer, J.-M.Spaeth (Fachbereich Phys., Univ.-GH Paderborn, Paderborn, Germany).
Phys. Status Solidi b (Germany), vol.119, no.1, p.171-8 (1 Sept. 1983).
For pt.I see ibid., vol.118, p.557 (1983). In crystals containing simultaneously $F(Cl^-)$ and $F(F^-)$ centres in certain frequency regions the ENDOR spectra are superimposed to such a degree that an analysis is not possible. With double ENDOR experiments the ENDOR spectra of both centres can be separated. The ratio of the ENDOR signal heights compared to the double ENDOR signal heights is found to be characteristic for the shell of the nuclei involved. It can be used to discriminate between ENDOR lines of different shells. The effect cannot be understood on the basis of rate equations with reasonable assumptions for the spin-lattice relaxation times. It is probably due to spin diffusion. (13 refs.)

119953 Nonlinear effects in the electron-nuclear spin system of a semiconductor following absorption of light of variable circular polarization. R.I.Dzhioev, I.A.Merkulov, M.N.Tkachuk, V.G.Fleisher (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.6, p.1304-8 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2252-9 (Dec. 1982). [received: Oct. 1983]
Investigates theoretically and experimentally nonlinear phenomena that accompany orientation of the electron-nuclear spin system of a semiconductor

by light whose circular polarization oscillates in time at high frequency. The authors show that resonant absorption of the nuclear spin system in a field oscillating at close to the NMR frequency and produced by the oriented electrons at the nuclei can lead on the onset of bistable states of the electronic polarization. These states are connected with the partial cancellation of the external constant magnetic field by the effective nuclear field produced at the electrons by the polarized nuclei. The authors show in addition that a strong nuclear field can appear under nonresonant conditions if besides the modulation of the polarization of the exciting light one applies to the sample an external magnetic field that oscillates in phase with the average spin of the produced electrons. The appearance of this field is the cause of the instability of the electron-nuclear spin system in a zero constant magnetic field. (12 refs.)

76.80 MÖSSBAUER EFFECT; OTHER GAMMA-RAY SPECTROSCOPY

119954 Formation of the crystal structure of the ferrite $BaFe_{12}O_{19}$. L.M.Letyuk, M.N.Shipko, V.S.Tikhonov, M.V.Dmitriev (Moscow Inst. of Steel & Alloys, Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1505-8 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1751-4 (Oct. 1982). [received: Sept. 1983]
The processes occurring during the formation of the crystal structure of the hexagonal ferrite $BaFe_{12}O_{19}$ have been studied by Mossbauer spectroscopy. It has been established that at 1000-1100K the lattice of the ferrite $BaFe_{12}O_{19}$ forms by means of the diffusion of Ba^{2+} and O^{2-} ions into α-Fe_2O_3 without the appearance of intermediate phases. It has been shown that at 1300-1500K the formation of this ferrite is also limited by diffusion processes. However, the formation of the ferrite $BaFe_{12}O_{19}$ through intermediate phases of $BaFe_2O_{14}$ or Fe_3O_4 is possible. (6 refs.)

119955 Isomer shifts and force constants of substitutional ^{119}Sn impurity atoms in FCC metals. H.Andreasen, S.Damgaard, J.W.Petersen, G.Weyer (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).
J. Phys. F (GB), vol.13, no.10, p.2077-88 (Oct. 1983).
Isomer shifts and Debye temperatures for substitutional ^{119}Sn impurity atoms in the FCC metals Al, Ag, Au, Cu, Pb, Pd, Pt and Rb were determined by Mossbauer emission spectroscopy on the 24 keV γ radiation of ^{119}Sn. The radiation sources were prepared by ion implantations of radioactive ^{119}In and ^{119}Sb isotopes into single crystals and high-purity foils of the respective metals. Correlations are discussed between measured isomer shifts and electronic properties of the host materials (the Fermi-level free-electron density $n_F^{1/3}$ and the cell-boundary electron-density parameter $n_{WS}^{1/3}$ from the Miedema theory of alloy formation). The Debye temperatures for ^{119}Sn are interpreted in terms of the Einstein-Debye and the Mannheim models for impurity lattice vibrations. (39 refs.)

119956 Magnetism in Eu-based amorphous alloys from local and bulk investigations. M.Maurer, J.M.Friedt (CRN, Strasbourg, France).
J. Phys. F (GB), vol.13, no.10, p.2175-88 (Oct. 1983).
The magnetic properties of Eu^{2+} ($4f^7$ electronic configuration) based amorphous alloys $Eu_{1-x}X_x$, where X=Mg, Zn, Cd and Al and $x \simeq 0.3$, have been investigated by studying local moments from ^{151}Eu Mossbauer spectroscopy and bulk magnetisation in low AC and high DC fields. The divalent $4f^7$ state of Eu atoms implies vanishing interactions with crystal fields. The magnetic properties are then assumed to be depicted by localised $4f^7$ moments interacting via RKKY interactions, in view of the pure s (Mg, Zn, Cd) or sp (Al) character of the valence electron shells of the components. Amorphous $Eu_{1-x}Al_x$ (x=0.225, 0.30 and 0.40) are concentrated spin glasses (mictomagnets). Amorphous $Eu_{0.70}Zn_{0.30}$ (T_C=133K) and $Eu_{0.75}Cd_{0.25}$ (T_C=134K) reveal all the properties of soft ferromagnets in the presence of some distribution of the exchange interaction, resulting from the disorder. Amorphous $Eu_{0.70}Mg_{0.30}$ exhibits a double magnetic transition, i.e. from paramagnetic to ferromagnetic, at T_C=131K and from ferromagnetic to spin glass at $T_{SG} \simeq 52$K. The latter re-entrant spin-glass transition is consistently characterised both from AC susceptibility and from the anomalous temperature dependence of the hyperfine field distribution. Amorphous $Eu_{0.70}Mg_{0.30}$ is concluded as representing an example of a cluster spin glass (with intercluster frustration) whereas the amorphous $Eu_{1-x}Al_x$ alloys would present short-range frustration. (29 refs.)

119957 Mossbauer study of SbF_5-doped polyacetylene. F.Godler, B.Perscheid, G.Kaindl (Freie Univ. Berlin, Berlin, Germany), K.Menke, S.Roth.
J. Phys. Colloq. (France), vol.44, no.C-3, p.233-7 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
SbF_5-doped polyacetylene was studied on samples with dopant concentrations ranging from 0.1 to 8.4 mol%, using ^{121}Sb Mossbauer spectroscopy. The spectra reveal the presence of SbF_3, SbF_5, and SbF_6^-, respectively. From the relative intensities of the well-separated subspectra the authors could determine the relative fractions of the three molecular species as a function of dopant concentration. (5 refs.)

119958 Mossbauer spectroscopy studies of polyacetylene doped chemically and electrochemically with iron chlorides. Z.Kucharski (Inst. of Nuclear Res., Otwock-Swierk, Poland), M.Lukasiak, J.Suwalski, A.Pron.
J. Phys. Colloq. (France), vol.44, no.C-3, p.321-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Doping of polyacetylene with iron chloride complexes has been studied by Mossbauer spectroscopy. It was proved that the doped polymer undergoes degradation in air manifested by the formation of $FeCl_2.nH_2O$ with the simultaneous chlorination of the double bond. (6 refs.)

119959 Temperature depedence of the electric field gradient in $AgIn_2$ intermetallic compound. L.G.Brunnet, M.Behar, R.Iglesias, J.A.H.Da Jornada, R.P.Livi (Inst. de Fisica, Univ. Federal do Rio Grande do Sul, Porto Alegre, RS, Brazil), H.Saitovitch.
Phys. Lett. A (Netherlands), vol.97A, no.7, p.294-6 (12 Sept. 1983).
The temperature dependence of the electric field gradient in the $AgIn_2$ intermetallic compound was measured using the TDPAC technique. From 80K up to 415K a linear dependence was found. Below 80K a change in this behaviour was observed. This and previous results are interpreted as related to optical-phonon modes in intermetallic compounds. (8 refs.)

119960 Nuclear level mixing resonances on low temperature oriented nuclei. R.Coussement, P.Put, L.Hermans, M.Rots (Inst. voor Kern- en Stralingsfysika, Leuven Univ., Leuven, Belgium).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.301-4 (12 Sept. 1983).
The angular distribution of gamma radiation emitted from oriented nuclei can show resonance signals under the influence of combined magnetic and electric quadrupole interactions acting as an intermediate state perturbation. An exploratory experiment shows the feasibility of this method. Perspectives of using these level mixing resonances on oriented nuclei (LMR/ON) are also discussed. (6 refs.)

119961 Mossbauer study of the lattice location of ^{57}Co implanted in graphite. M.De Potter, G.Langouche (Inst. voor Kern- and Stralingsfysika, Leuven Univ., Leuven, Belgium).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.404-8 (26 Sept. 1983).
The lattice location of ^{57}Co implanted into graphite is studied by ^{57}Fe Mossbauer spectroscopy. An asymmetric doublet is observed. From a study of the line intensities as a function of crystallographic orientation, sample temperature and annealing treatment, it is concluded that this is not a quadrupole doublet, but belongs to two different Co configurations in graphite. (17 refs.)

119962 Iron hyperfine field distribution in amorphous Fe-Ni-Cr-Mo-Si-B. G.Rajaram (Tata Inst. of Fundamental Res., Bombay, India), S.Prasad, G.Chandra, S.N.Shringi, R.Krishnan.
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.57-9 (3 Oct. 1983).
The distribution of Fe hyperfine fields, $P(H)$, has been studied for the amorphous ferromagnetic alloys $Fe_{40-x/2}$ $Ni_{40-x/2}Cr_xMo_2Si_{10}B_8$, x=0, 1, 3, 4, 5 by Mossbauer measurements at room temperature. The results favour a bimodal distribution for $P(H)$ as suggested earlier for METGLAS 2826A. The low field component is found to increase with x. (13 refs.)

119963 Atomic structure and magnetic properties of the pseudobinary alloys Fe_3(Al, Si). O.Schneeweiss, T.Zemcik, T.Zak (Inst. of Phys. Metall., Acad. of Sci., Brno, Czechoslovakia), S.Mager.
Phys. Status Solidi a (Germany), vol.79, no.1, p.125-9 (Sept. 1983).
The influence of substitution of Al by Si on the atomic order, saturation magnetic polarization, and electrical resistivity is studied in $Fe_3Al_{1-x}Si_x$, $0 \leq x \leq 1$, alloys. The changes in the hyperfine parameters of the ^{57}Fe Mossbauer spectra indicate that the degree of DO_3 order after order anneal is increased, accompanied by a separation of the Fe_3Si and Fe_3Al types of local surroundings. The most significant changes of isomer shifts, magnetic hyperfine fields, saturation magnetic polarization, and electrical resistivity due to atomic order are observed near the Fe_3Al and $Fe_3Al_{0.25}Si_{0.75}$ compositions. (10 refs.)

119964 Defect recovery and trapping in plastically deformed Au studied by perturbed angular correlations of ^{111}In. G.S.Collins, C.Allard, R.B.Schuhmann, C.Hohenemser (Dept. of Phys., Clark Univ., Worcester, MA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.2940-6 (15 Sept. 1983).
Au samples doped with ^{111}In impurities and heavily deformed at 77K were studied by perturbed angular correlations after undergoing isochronal annealing up to 500K. Between 150 and 500K the authors detected formation and dissolution of five defect-probe traps characterized by distinctive quadrupole interaction frequencies. Based on previous identifications of four of the traps and arguments that a previously undetected trap forming at 162K has vacancy character, their experiments suggest trivacancy, divacancy, and monovacancy recoveries at 162, 180, and 240K, respectively. From the order of the recoveries, they conclude that all three species are present immediately after deformation. For divacancies they observed thermally activated in situ transformation between two distinguishable trap configurations. The details of their isochronal annealing curves are well simulated via a kinetic rate model which assumes only first-order processes, and the trapping stages are found to explain most but not all features of stored-energy-release measurements. (22 refs.)

119965 Investigation of magnetic properties of amorphous ferrite magnetic materials by the Mossbauer method. Yu.T.Pavlyukhin, Ya.Ya.Medikov, V.V.Boldyrev (Inst. of Solid-State Chem. & Processing of Minerals, Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.358-60 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.630-4 (March 1983). [received: Oct. 1983]
The Mossbauer spectroscopy method was used to investigate the magnetic properties and steric characteristics of exchange pairs in amorphous ferrite magnetic materials prepared by mechanical activation of polycrystalline zonc and nickel ferrites. It was found that the oxygen sublattice of such magnetic materials remained close-packed, but the sequence of the oxygen planes was disturbed. Cations were transferred from the tetrahedral to the octahedral positions, so that all the cations in these amorphous materials were solely in positions of octahedral environment of oxygen ions. The Neel temperature of zinc ferrite increased from 9 to ~210K, whereas that of nickel ferrite decreased from 858 to ~260K, compared with the crystalline analogs of these materials. (11 refs.)

119966 Isomeric and Knight shifts for a conductor with resonance states of electrons at defects. V.O.Sokolov.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.513 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.892-4 (March 1983). [received: Oct. 1983]
The author studies the effect of defect resonance levels on the isomeric and Knight shifts of the spectra of the hyperfine interaction of nuclei with the conduction electrons. He denotes by $\Delta(T)$ the isomeric shift of a Mossbauer line at a temperature $T \ll \epsilon_F/k_B$ measured relative to the position of the line at the same temperature in a perfect crystal. (5 refs.)

77.00 DIELECTRIC PROPERTIES AND MATERIALS

(for conductivity phenomena, see 72.20 and 72.80)

77.20 PERMITTIVITY

119967 Dielectric properties of fibre glass epoxy laminate in high frequency transitory regime. F.Vilches De Frutos, J.M.Guerra Perez (Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.134-40 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The dielectric constant from fiber glass epoxy laminate used in pulsed transversaly excited lasers is measured in a high-frequency (0.5-100 MHz) high-voltage ($\simeq$10 KV) sinusoidal transitory regimen. The authors obtain an interval of constancy of the real part of the permittivity longer than when measured by classical methods. This enlargement appears on the section of the spectrum where the laser operates. (8 refs.)

119968 Dielectric study of S_{A1}, S_{A2} and $S_{\tilde{A}}$ phases in liquid crystals of cyano compounds. C.Druon, J.M.Wacrenier, F.Hardouin, Nguyen Huu Tinh, H.Gasparoux (Univ. de Lille, Villeneuve d'Ascq, France).
J. Phys. (France), vol.44, no.10, p.1195-200 (Oct. 1983).
The authors present a dielectric study of the monolayer (SA_1) and bilayer (SA_2) smectic phases and of the smectic antiphase ($S_{\tilde{A}}$) for a mixture of 4-cyanobenzoyloxy-4′-pentyl stilbene (C5 stilbene for short) and 4-*n*-hexylphenyl-4′-cyanobenzoyloxy benzoate (DB6 for short) and for the pure compound DB6. For the measurement with the direction of the electric field **E** parallel to the director **n**, in the S_{A2} phase, the dielectric spectra observed reveal: a decrease of $\epsilon'_{\parallel}$, an increase of the activation energy of the molecular reorientation mechanism for DB6, the appearance of a second absorption domain for the mixture, connected either to a cooperative phenomenon or to the existence of molecules of different types. For $\mathbf{E} \perp \mathbf{n}$, the study shows mainly an increase of $\epsilon'_{\perp}$ at the transitions N-$S_{\tilde{A}}$ and N-S_{A2}. These results suggest that there are strong correlations between the molecular motions, due to the presence of strong interactions, particularly in the S_{A2} phase. These correlations are probably due, for the compounds studied, to the existence in the molecule of groups with dipolar moments whose transverse components are important. (27 refs.)

119969 Semi-empirical expression for the dielectric constant of polar, polarisable liquids. J.R.Macdonald, S.W.Kenkel (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
J. Phys. D (GB), vol.16, no.10, p.L195-9 (14 Oct. 1983).
A new formula is compared with that of Onsager, Kirkwood and Frohlich (OKF) for 39 associated and non-associated liquids. The new expression is found to be generally superior to the older one and often yields excellent estimates of the static dielectric constant with no disposable parameters such as the uncertain Kirkwood correlation factor *g* needed in the OKF equation. (15 refs.)

119970 Dielectric properties of some insulating liquids. K.N.Abd-El-Nour, F.F.Hanna (Nat. Res. Centre, Cairo, Egypt).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.9, p.723-9 (Sept. 1983).
Mineral pertroleum oils are the most commonly used of all insulating liquids in transformers and capacitors. Vegetable oils are also used as insulating and cooling liquid in some types of transformers and as plasticizers in synthetic resin compositions. Systematic studies of the dielectric properties of these oils are not yet available over a wide range of frequency and temperature. The authors aim to cover this lack of information. (8 refs.)

119971 Low-temperature dielectric constant of near-stoichiometric Na β-alumina. J.N.Dobbs, A.C.Anderson (Dept. of Phys., Univ. of Illinois at Urbana-Champaign, Urbana, IL, USA), W.Hayes.
Phys. Rev. B (USA), vol.28, no.6, p.3559-60 (15 Sept. 1983).
Measurements of the dielectric constant of Na β-alumina at temperatures below 2K reveal that the density of low-energy excitations is not a function of the Na stoichiometric excess for the range 7-35% excess Na. (12 refs.)

77.30 POLARIZATION AND DEPOLARIZATION EFFECTS

119972 Effect of gas on the electret charge reduction by radiation. M.Ikeya (Tech. Coll., Yamaguchi Univ., Ube, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1200-5 (July 1983).
The radiation-induced reduction of the surface charge on polymer foil thermoelectrets has been studied in relation to the effect of the gas surrounding the electret. The reduction of the charge due to gas ion collection depends strongly on the gas in the chamber. The charge reduction in a parallel-plate electret dosimeter is treated theoretically following the ionization chamber theory for the electret-induced electric field strength of the ionization chamber region (ICR) and the gas ion recombination region (RR). The exponential reduction of the charge by radiation in an intense electret of fluoride polymers is also described, using the gas ion multiplication model. The electric field induced by the electret is considered to have entered the proportional counter region (PCR). (23 refs.)

119973 Thermally stimulated current of crosslinked polyethylene by electron beam irradiation. M.Hanai, M.Aihara, F.Aida, T.Shiono.
Showa Wire & Cable Rev. (Japan), vol.33, no.1, p.61-6 (1983). In Japanese.
The change in AC breakdown voltage in polyethylene insulation was investigated after crosslinking by electron beam irradiation. TSC (thermally stimulated current) of the irradiated polyethylene insulation was measured in order to estimate the distribution of space charges resulting from irradiation. As a result, it was found that when the maximum depth of the electron penetration was too low for the thickness of insulation, the insulation retained residual space charges, causing a reduction in AC breakdown voltage. It is conceivable that an electrostatic field induced by the residual charges is superimposed on the AC field, thus allowing an intense electric field to be formed in the insulation. The TSC peak from residual charges disappeared after heat treatment. Crystallinity of polyethylene correlates with the TSC peak area. Therefore, it may be postulated that charges are trapped in crystal boundaries. Electron beam curing process provides a highly practical technique for manufacturing crosslinked polyethylene insulated wires, but care should be taken in determining the manufacturing conditions and the insulating materials considering the effect of space charges. 77.40 DIELECTRIC LOSS AND RELAXATION

119974 Dielectric relaxation spectroscopy of sheet molding compound. K.Venkataswamy, K.E.Stephens, H.Hughes, C.L.Beatty (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
Polym. Compos. (USA), vol.4, no.3, p.180-2 (July 1983).
Dielectric relaxation spectroscopic studies of sheet molding compound from 400 Hz to 100 kHz reveal the relaxation processes that exist in this material. The frequency dependence of SMC is presented and analyzed in terms of different relaxation process models. A transition map of SMC is presented. (12 refs.)

119975 Dielectric relaxation processes of some dialkyl disulfides. H.A.Khwaja, S.Walker (Dept. of Chem., Lakehead Univ., Thunder Bay, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.9, p.2107-11 (Sept. 1983).
Dielectic relaxation studies have been performed for dimethyl, diethyl, diisopropyl, di-n-butyl, di-tert-butyl, and di-n-octyl disulfides in a polystyrene matrix. For the last five compounds the absorption appears in two temperature regions. The relaxation data for the higher temperature regions are consistent with intramolecular rotation around the S-S bond with accompanying flexibility in the alkyl chains. The enthalpy barrier to this relaxation process is $\sim$29 kJ mol^{-1} and is the trans (lower) barrier. This value is typical for all six dialkyl disulfides. The most likely interpretation of the low temperature process is that there is segmental relaxation of the alkyl chains which also involves movement of the main dipoles (S-S and S-c). (23 refs.)

119976 Primary amines: a low-temperature dielectric relaxation study. J.Gilchrist (Centre de Recherches sur les Tres Basses Temperatures, CNRS, Grenoble, France).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.63-72 (Oct. 1983).
The 4.2K dielectric absorption spectrum of a polyethylene film containing 1-aminoadamantane is reported. At very low frequencies the absorption varied as the square root of frequency, and the Cole-Cole plot approached the real axis at 45°. This exemplifies a characteristic behaviour of primary amines and is to be expected only if the amino proton spin symmetry species are relatively long lived. Tunnel splittings of the normal and deuterated species are evaluated. Eighteen other amine species were studied, including aminocycloalkanes, alkylhydrazines and dialkylhydrazines. Aminocyclobutane relaxed faster than most (low inversion barrier) and methylhydrazine relaxed slowly in accordance with expectations based on its microwave spectrum. (33 refs.)

119977 Comment on 'Dielectric relaxation of adsorbed water in microcrystalline cellulose'. R.P.Singh (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Phys. D (GB), vol.16, no.10, p.L207-8 (14 Oct. 1983).
For original paper see ibid., vol.16, p.915 (1983). The accuracy of the measurement technique used by Kent and Meyer and the reliability of their data on dielectric constant ϵ' and loss tangent ϵ'' are discussed. (5 refs.)

119978 Fast response of a dielectric to the motion of a charge. H.L.Friedman (Chem. Dept., State Univ. of New York, Stony Brook, NY, USA).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1465-7 (Sept. 1983).
Within the continuum theory of dielectric response there is a common mechanism for the two relaxation times which may be elicited by appropriate experiments. An explanation of this paradox is offered. (10 refs.)

119979 Dielectric relaxation and order parameters in mixtures of 4-cyanobiphenyl and MBBA. V.K.Agarwal, A.H.Price (Edward Davies Chem. Lab., Univ. Coll. of Wales, Aberystwyth, Wales).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.193-200 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Dielectric studies on MBBA and its solutions doped with 4-cyanobiphenyl (CB) are reported at reduced temperatures of 0.996 over the frequency range of 0 to 200 MHz. The longitudinal and transverse dipole components are evaluated as well as the order parameter. The results are self consistent only after an additional relaxation process is presumed at frequencies greater than 200 MHz. This may arise from the internal rotation of the terminal methoxy group in MBBA. (7 refs.)

77.50 DIELECTRIC BREAKDOWN AND SPACE-CHARGE EFFECTS

119980 Effect of prestressing on electrical breakdown in polyethylene at high temperature. S.Katakai, K.Yahagi (Dept. of Electrical Engng., Waseda Univ., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1221 (July 1983).
High-temperature breakdown in polyethylene with fixed electrodes is reported. The samples consisted of low-density polyethylene (LDPE) film (melt index $M.I=3.0$, density $\rho=0.917$ g/cm^3, thickness $d=50$ μm) embedded in a cured epoxy resin with stainless-steel ball electrodes. Following a period of prestressing with negative direct voltage, a positive or negative impulse voltage was superimposed on the direct voltage. Two cases occurred: (i) when the impulse voltage produced a reversal of polarity on the sample, and (ii) when the polarity remained unchanged. (2 refs.)

119981 Influence of molecular structure on the low frequency dielectric relaxation of *p*-cyano-substituted liquid crystals in nematic solution. G.Heppke, J.Kayed, U.Muller (Liquid Crystal Res. Group, Tech. Univ. Berlin, Berlin, Germany).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.309-19 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The dielectric properties of several *p*-alkyl-*p*′-cyano-substituted liquid crystals of different molecular length, dissolved in the nematic mixture ZLI 1275, have been investigated as a function of frequency and temperature. Low relaxation frequencies have been observed which decrease from 138 kHz to 1.5 kHz at 25°C roughly corresponding to the increase of molecular length. Arrhenius plots show good linear relations with the activation energies being found to increase with decreasing relaxation frequency. (14 refs.)

119982 Firing wave instability of the current filaments in a semiconductor. An analogy with neurodynamics. K.Aoki, K.Yamamoto (Dept. of Electrical & Electronic Engng., Kobe Univ., Kobe, Japan).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.72-6 (3 Oct. 1983).
Periodic oscillations and chaos have been observed in the firing density wave of the current filaments in n-GaAs at 4.2K. The mechanism of the firing-wave instability has been discussed by an analogy with neurodynamics. (14 refs.)

Thermally stimulated current of crosslinked polyethylene by electron beam irradiation ....See Entry 119973

77.55 DIELECTRIC THIN FILMS

119983 Modeling of thermally stimulated currents in polytetrafluoroethylene. R.L.Remke (Bell Labs., Indianapolis, IN, USA), H.von Seggern.
J. Appl. Phys. (USA), vol.54, no.9, p.5262-6 (Sept. 1983).
A phenomenological model has been derived for the thermally stimulated open-circuit current measured on negatively charged polytetrafluoroethylene electret film. The model is based on trap controlled release of negative charge carriers using approximations justified by thermally stimulated current and mean charge depth results. To describe the open-circuit current, a minimum of five traps was necessary including surface and bulk traps with activation energies of 1.3(2), 1.4, 1.5 and 1.7 eV. In addition, attempt-to-escape frequencies were calculated and found in the range 10^{11}-10^{13} s^{-1}. (36 refs.)

Effect of prestressing on electrical breakdown in polyethylene at high temperature ....See Entry 119980

77.60 PIEZOELECTRICITY AND ELECTROSTRICTION

(for piezo-optical effects, see 78.20H)

119984 Echo phenomena in piezoelectric powders. I.Turek, I.L.Bajak (Dept. of Phys., Tech. Univ. of Transport & Telecommunications, Zilina, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.293-305 (1983).
The problem under discussion is the dynamical and the memory echo formation in piezoelectric powders. It enables the authors to classify different mechanisms of echo creation. The mechanism of permanent echo as well as the mechanism of the formation of memory due to Chladni's effect are suggested as new, so far unknown processes of echo creation. (11 refs.)

119985 Influence of additions on the electrophysical properties of lead titanite zirconate. O.S.Didkovskaya, V.A.Zvonik, G.E.Savenkova, N.I.Selikova, V.S.Lyushenko, V.V.Dorofeeva, V.V.Klimov (All-Union Sci.-Res. Inst. of Reagents & Chemically Pure Materials for Electronics, SSR).
Inorg. Mater. (USA), vol.18, no.10, p.1502-5 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1747-50 (Oct. 1982). [received: Sept. 1983]
The influence of complex additions containing Bi^{3+}, Nb^{5+} or W^{6+}, and other ions on the properties of piezoelectric ceramics based on lead titanate zirconate has been studied. It has been established that the introduction of additions with a number of compositions makes it possible to obtain ceramics with high characteristics ($\epsilon_{33}T/_{\epsilon 0}=1400$ to 5000, $K_p\geq 0.60$). (15 refs.)

119986 Material nonlinear piezoelectric coefficients for quartz. R.Brendel (Lab. de Phys. et Metrologie des Oscillateurs, Univ. de Franche-Comte Besancon, Besancon, France).
J. Appl. Phys. (USA), vol.54, no.9, p.5339-46 (Sept. 1983).
An electroelastic or polarizing effect can be used to obtain material nonlinear piezoelectric or electroelastic coefficients. It is shown that these material coefficients, obtained from general rotationally invariant nonlinear equations for small field superposed on a bias, differ from those obtained by using the phenomenological expansion of the effective elastic constants. The eight independent electroelastic coefficients listed here were calculated by using experimental data available in the literature. (16 refs.)

77.70 PYROELECTRIC AND ELECTROCALORIC EFFECTS

119987 Pyroelectric properties and domain structure of partly deuterated NH_4HSeO_4 crystals. H.Pykacz, J.Mroz (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland), Z.Czapla, O.Czupinski.
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.285-7 (Sept. 1983).
The pyroelectric properties and domain structure were investigated of partly deuterated AHSe crystals grown from aqueous solutions containing 10, 20, 40, and 70% molar deuterium. These investigations confirmed the existence of the phase transition to the ferroelectric phase and to the low temperature phase in the crystals containing up to 40% molar deuterium. The phase transition temperature obtained from extrapolation for 100% D is shifted towards higher temperature by 27 deg. It is shown that crystals with 70% molar deuterium do not exhibit the ferroelectric properties along the *b*-axis and also the pyroelectric properties along the *c*-axis which for nondeuterated crystals are ferroelectric and pyroelectric axes respectively. (14 refs.)

119988 Relationship between the pyroelectric coefficient and the lattice dynamics of the pyroelectrics. N.D.Gavrilova, S.N.Drozhdin, V.K.Novik (Moscow State Univ., Moscow, USSR), E.G.Maksimov.
Solid State Commun. (USA), vol.48, no.2, p.129-33 (Oct. 1983).
The experimental results for a temperature dependence of the pyroelectric coefficient are represented for twenty different crystals in a wide temperature range. Current theories are used for an analytical fitting of this result. It is shown that in the ferroelectrics the pyroelectric coefficient γ^σ is defined mainly by optical phonon modes in comparison with the linear pyroelectrics in which γ^σ follows the T^3 law due to acoustic phonon. The possibility of an appearance of the linear temperature dependence of $\gamma^\sigma\approx T$ suggested by Born (1954) is discussed briefly. The experimental results show that such behavior indeed exists but only in very imperfect crystals and at very low temperatures. (21 refs.)

119989 Dielectric, pyroelectric, and magnetic properties of $BiMn_2O_5$ crystals. I.D.Zhitomirskii, N.E.Skorokhodov, A.A.Bush, O.I.Chechernikova, V.F.Chuprakov, Yu.N.Venevtsev (L.Ya. Karpov Physicochem. Sci.-Res. Inst., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.550-1 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.953-5 (March 1983). [received: Oct. 1983]
Crystals of $BiMn_2O_5$ exhibit antiferromagnetic ordering below 42K (Ref. 1). The presence of highly polarizable Bi^{3+} ions with an unshared electron pair in $BiMn_2O_5$ favors the appearance of special dielectric properties in this compound. The results of growth of $BiMn_2.O_5$ single crystals as well as of a study of their X-ray, dielectric, pyroelectric, and magnetic properties. (6 refs.)

77.80 FERROELECTRICITY AND ANTIFERROELECTRICITY

119990 Ferroelectricity and dielectric critical slowing-down in $LiNaGe_4O_9$ single crystal. M.Wada, M.Shibata, A.Sawada, Y.Ishibashi (Synthetic Crystal Res. Lab., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2981-2 (Sept. 1983).
Single crystals of $LiNaGe_4O_9$ were grown by the Czochralski technique from stoichiometric melt. It has been found that $LiNaGe_4O_9$ shows ferroelectric activity in the *a*-direction below $T_c=112.7$K. The spontaneous polarization is about 0.33 μC/cm^2 at 110.3K. The complex dielectric constants were measured at 120 Hz, 1 kHz and 10 kHz as functions of temperature. The dielectric dispersion has been found in the above frequency region and explained by the critical slowing-down of the polarization relaxation process. (2 refs.)

77.80B Transitions and Curie point

119991 Investigation of ferroelectric phase transitions in powdered TGS using electroacoustic echo. I.L.Bajak, I.Turek, J.Vanco (Tech. Univ. of Transport & Telecommunications, Zilina, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.307-14 (1983).
Ferroelectric phase transition in powdered triglycine sulphate is studied using electroacoustic echo at 35 MHz. Dynamical echoes of the 1st and 2nd orders as well as memory echo have been observed at room temperature. The temperature dependence of the relaxation time and the amplitude of the 1st order echo have been measured. It was shown that the Curie point in the powdered sample is shifted to a higher temperature. A ringing signal has been observed also in the paraelectric phase. The ringing signal in the paraelectric phase is very probably due to a quadrupole piezoelectric effect. (7 refs.)

119992 Ferroelectric properties of compounds with magnesium orthotellurate structure. L.I.Kosse, E.D.Politova, V.V.Chechkin, E.A.Myzgin, B.S.Medvedev, Yu.N.Venevtsev (L.Ya. Karpov Physicochem. Sci. Res. Inst., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1616-19 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1879-82 (Nov. 1982).
A complex experimental study has been carried out of the structures, phase transitions, and electrophysical properties of ceramic samples of the compounds Mg_3TeO_6, Mn_3TeO_6, $CdMn_2TeO_6$, and Cd_2MnTeO_6. It was concluded that the last three compounds are ferroelectrics with Curie points of 510, 570, and 400K and that a transition into a spontaneously polarized state takes place at 520K in the first compound. (7 refs.)

119993 Study of ferroelectric CsH_2PO_4 by the ultrasonic velocity and attenuation measurements. E.Kanda, A.Tamaki, T.Yamakami, T.Fujimura (Res. Inst. for the Sci. Measurements, Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3085-92 (Sept. 1983).
The velocity V and the attenuation α of the longitudinal ultrasonic waves have been measured accurately near the ferroelectric phase transition temperature. Critical anomalies in the paraelectric phase were represented by $\Delta V \sim -\log(T-T_0)$ and $\sqrt{\Delta\alpha} \sim \log(T-T_0)$, where T_0 was determined from the simultaneously measured dielectric constant $\epsilon = C/(T-T_0)$. It was also found that the energy relaxation time τ_E varies as $\tau_E \sim (T-T_0)^{-1}$. This type of critical behavior is the same as that of the usual ferroelectrics. Thus it is concluded that the dipole-dipole interaction is dominant in the critical anomaly of the ultrasonic waves of CDP. Analysis of the attenuation based on the dynamical scaling law is also presented.

119994 Crystallographic changes characterizing the Curie transition in three ferroelectric copolymers of vinylidene fluoride and trifluoroethylene. I. As-crystallized samples. A.J.Lovinger (Bell Labs., Murray Hill, NJ, USA), T.Furukawa, G.T.Davis, M.G.Broadhurst.
Polymer (GB), vol.24, no.10, p.1225-32 (Oct. 1983).
Copolymers of vinylidene fluoride/trifluoroethylene of molar composition 65/35, 73/27 and 78/22% respectively, are ferroelectric and undergo a Curie transition to the paraelectric state at high temperatures. In contrast to the irregular structure found earlier for the 52/48 mol.% copolymer, the structures of these three compositions in the low-temperature state are well ordered and analogous to that of β-poly(vinylidene fluoride): they consist of molecular chains in a polar trans conformation whose order is improved with increasing vinylidene fluoride content, packed pseudo-hexagonally in unit cells whose dimensions decrease with increasing vinylidene fluoride content. In their paraelectric phase, the chains assume a partly disordered conformation consisting of irregular TG, $T\bar{G}$ and TT sequences and are packed on an expanded pseudo-hexagonal lattice. The Curie transitions were found to occur over a broad temperature range, encompassing ~30°C, and in the case of the 78/22 mol.% copolymer to extend into the melting region; they were also found to exhibit hysteresis by occurring at much lower temperatures upon cooling than upon heating. (21 refs.)

119995 Crystallographic changes characterizing the Curie transition in three ferroelectric copolymers of vinylidene fluoride and trifluoroethylene. II. Oriented or poled samples. A.J.Lovinger (Bell Labs., Murray Hill, NJ, USA), T.Furukawa, G.T.Davis, M.G.Broadhurst.
Polymer (GB), vol.24, no.10, p.1233-9 (Oct. 1983).
For pt.I see ibid., vol.24, no.10, p.1225-32 (1983). The effects of uniaxial drawing or poling on the structural changes involved in the ferroelectric-to-paraelectric phase transition in copolymers of vinylidene fluoride and trifluoroethylene were examined and compared to the behaviour of as-crystallized films. The compositions studied were 65/35, 73/27 and 78/22 mol.% vinylidene fluoride/trifluoroethylene, all of which crystallize from the melt with a molecular conformation and packing analogous to those of the common piezoelectric β-phase of poly(vinylidene fluoride). Contrary to the previously described behaviour of a 52/48 mol.% copolymer, orientation did not induce any significant changes in the structure of these copolymers or in its variation with temperature, primarily because these already crystallize directly from the melt in well-ordered, compact unit cells. The electrical poling caused the all-trans chains of the ferroelectric phase to be packed more compactly and to survive to higher temperatures, thus shifting the Curie transition closer to the melting points of these copolymers. As a result, competition from melting interfered with the later stages of this solid-state transformation in the 73/27 mol.% composition, and aborted it at a very early point in the 78/22 mol.% samples. The Curie temperature was found to exhibit hysteresis between heating and cooling parts of the thermal cycle, to extend over a broad range of temperatures, and to involve intramolecular changes to the same disordered conformation found in melt-crystallized samples. (18 refs.)

119996 Domain wall pinning by defects and the C-I transition. M.V.Feigel'man (L.D. Landau Inst. for Theoretical Phys., Moscow, USSR), I.F.Lyuksyutov.
Solid State Commun. (USA), vol.48, no.4, p.397-8 (Oct. 1983).
The influence of randomly distributed defects on domain wall fluctuations is investigated. These fluctuations lead to the long-range repulsion between domain walls resulting in the experimentally observed $n \sim \sqrt{|T-T_c|}$ behaviour of the domain wall density near the C-I transition. The impossibility of thermal depinning of one domain wall in the impurity potential is also shown. (10 refs.)

119997 The hampered sideways motion of a single domain wall in Rochelle salt crystals. R.Styrkowiec (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K99-102 (Sept. 1983).
Domain wall displacement was caused in two ways: first by applying an external electric field (along the polarization direction) and second by applying unidirectional stress (in (001) direction). The electric field and external stress were gradually increasing. After each rise of electric field (or stress) the domain walls shifted by some distance and then stopped. In both cases slow changes of domain structures were observed. The displacement of walls was measured by means of a calibrated eyepiece. (27 refs.)

119998 Photogenerated gap states in polyacetylene. J.Orenstein (Bell Labs., Murray Hill, NJ, USA), G.L.Baker, Z.Vardeny.
J. Phys. Colloq. (France), vol.44, no.C-3, p.407-12 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Measures the optical absorption spectrum of photogenerated gap states in polyacetylene, $(CH)_x$. From a comparison with electroabsorption spectra the charge state of the excitations is determined. In both isomers of $(CH)_x$ locally neutral (exciton-like) states are observed. In addition a charged photocarrier, with optical absorption deep in the gap, is seen in trans-$(CH)_x$ only. (13 refs.)

119999 The effect of vibronic transition on the interband optical-absorption in $(CH)_x$. E.Ehrenfreund (Phys. Dept., Technion-Israel Inst. of Technol., Haifa, Israel), D.Moses, A.J.Heeger.
J. Phys. Colloq. (France), vol.44, no.C-3, p.491-3 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A model for vibronic transitions in the quasi-one-dimensional semiconductor $(CH)_x$ is described. It appears that the resulting electron-phonon (e-p) coupling parameter is only a fraction of the e-p coupling constant responsible for the gap in $(CH)_x$. (7 refs.)

120000 Optical absorption in doped polyacetylene. M.Jestin, M.Kabbaj, J.P.Albert, C.Jouanin (Groupe d'Etudes des Semiconducteurs, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.499-502 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Optical absorption spectra of doped trans-polyacetylene are studied within the Su, Schrieffer and Heeger model (1979) assuming a regular lattice distribution of solitons induced by doping. (8 refs.)

78.20B General theory (for pure homogeneous materials)

120001 On the Urbach rule. B.L.Gel'mont, V.I.Perel', I.N.Yassievich (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.415-18 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.727-33 (March 1983). [received: Oct. 1983]
Optical transitions between two electron states involving a photon energy deficit Δ are studied. An asymptotically exact value of the overlap integral is used to demonstrate that a model in which the upper and lower electron states correspond to adiabatic potentials (represented by parabolas with different frequencies but identical equilibrium positions) leads to the Urbach rule, i.e. the probability of an optical transition is given by $W \propto \exp(-\sigma\Delta/T)$. The temperature dependence of the parameter σ is determined. Optical transitions at low temperatures are due to subbarrier tunnelling. (16 refs.)

Instability of polaritons driven by infrared laser light .... See Entry 119121

78.20D Optical constants and parameters

120002 Optical absorption edge in $Hg_{0.7}Cd_{0.3}Te$. J.A.Mroczkowski, D.A.Nelson, R.Murosako, P.H.Zimmermann (Honeywell Electro-Optics Div., Lexington, MA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1756-60 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Optical absorption measurements at the fundamental absorption edge in high purity and stoichiometrically doped p-type $Hg_{0.7}Cd_{0.3}Te$ show the absorption

edge to be significantly influenced by valence band tailing due to native Hg vacancy acceptor defects. The absorption coefficient α_e for transitions across the band gap increases as $\alpha_e=\alpha_0 \exp k(E-E_0)$; for high purity $Hg_{0.7}Cd_{0.3}Te$ at ambient temperatures $k=148$ eV^{-1}, this value decreases to $k=105$ eV^{-1} at acceptor concentrations of around 2×10^{16} cm^{-3}. (22 refs.)

120003 Absorption edge of tin disulfide single crystals. J.George, C.K.Valsala Kumari, K.S.Joseph (Dept. of Phys., Univ. of Cochin, Cochin, Kerala, India).

J. Appl. Phys. (USA), vol.54, no.9, p.5347-9 (Sept. 1983).

Absorption edge measurements in tin disulfide single crystals have been made. It is found that there is a shoulder in the absorption, just before the onset of band to band transitions, which is caused by transitions from the valence band to donor levels (due to a doubly ionizable sulfur vacancy) situated 0.17 eV below the conduction band. It is also found that there are three valence bands which originate by spin-orbit interaction and crystal field splitting. At room temperature (295K) the fundamental absorption starts at 2.070 ± 0.001 eV and the transition leading to this is an indirect forbidden one. The photoconductivity maxima, observed at 2.3 eV by earlier workers, is shown to be due to transitions from the third valence band to the conduction band. (19 refs.)

120004 Calculations of the mean-squared optical anisotropies of random-coil polypeptides. A.Lopez-Pineiro (Dept. de Quimica Fisica, Facultad de Ciencias, Univ. de Extremadura, Badajoz, Spain), M.P.Tarazona, E.Saiz.

J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.529-35 (June 1983).

Theoretical values of the mean-squared optical anisotropies $\langle\gamma^2\rangle$, of random-coil polypeptides of the twenty natural α-amino acids are calculated according to the valence optical scheme by the use of the rotational isomeric state model. The contribution of each repeat unit to the anisotropic part of the polarizability tensor of the chain $\hat{\alpha}_{=i}$ was computed by addition of previously optimized bond polarizabilities. Values of $\langle\gamma^2\rangle_1$ for single peptide units (identified for this calculation with molecules of the formula CH_3-CO-NH. CH_2R, where R is the side chain of each amino acid residue) range from 3.5 to 85.7 in units of 10^{-6}nm^6. The results of $\langle\gamma^2\rangle_x/x$ in the limit of $x\rightarrow\infty$ for homopolypeptides are roughly proportional to $\langle\gamma^2\rangle_1$ of the peptide unit. Ten actual proteins and three enzymes are also studied, their values of $\langle\gamma^2\rangle_x/x$ are almost identical and do not depend on the sequence of amino acids. (35 refs.)

120005 Anomalies in the optical and electrical properties of Cr-Al alloys. L.V.Nomerovannaya, V.A.Rassokhin (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Phys. Status Solidi a (Germany), vol.79, no.1, p.87-93 (Sept. 1983).

The frequency dependences of the real and imaginary parts of the complex dielectric constant in the spectral range of 0.069 to 5 eV and the temperature dependences of the resistance of the $Cr_{100-x}Al_x$ ($x\leq32$ at.% Al) alloy system are investigated. In alloys having 16 to 28 at.% of Al, a negative temperature coefficient of resistance, and a minimum metallic conductivity $\sigma(0)<1000$ Ω^{-1}, and a dielectrization of the optical properties is found, characterized by strong anomalous concentration and frequency dependences of the dielectric function in the infrared frequency range. From the analysis of the behaviour of the optical $\sigma(\omega)$ and the static $\sigma(0)$ conductivities it is concluded that the anomalies of optical and electrical properties result from the localization of free carriers near the Fermi level. (15 refs.)

120006 Crystalline ferroelectrics with glassy polarisation behaviour. G.Burns, F.H.Dacol (IBM Thomas J. Watson Res. Centre, Yorktown Heights, NY, USA).

Phys. Rev. B (USA), vol.28, no.5, p.2527-30 (1 Sept. 1983).

The authors report measurements of the optic index of refraction as a function of temperature, $n(T)$, in the crystalline ferroelectrics having the simple perovskite (ABO_3) structure. They show that these crystals possess a local, randomly oriented, nonreversible polarisation below a temperature T_d several hundred degrees above the ferroelectric phase-transition temperature T_c. Using a simple model, they account for this behaviour and understand quantitatively the values of T_d. This model, they believe, contains the basic physical understanding of ferroelectrics with a diffuse phase transition. (29 refs.)

120007 Optical properties of ferroelectric $(Pb_{1-x}Ba_x)_5$ Ge_3O_{11} for x=0 and 0.02. G.Burns, F.H.Dacol (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Phys. Rev. B (USA), vol.28, no.5, p.2531-4 (1 Sept. 1983).

The authors report accurate mesurements of the temperature dependence of the indices of refraction $[n(T)]$ in ferroelectric single crystals of $(Pb_{1-x}Ba_x)_5Ge_3O_{11}$ for $x=0$ and 0.02. Above the ferroelectric transition temperature T_c, $n(T)$ is linear with temperature. (It has been hoped that the $x=0.02$ sample would show nonlinear results similar to those observed in $BaTiO_3$.) Analyzing $n(T)$ below T_c in terms of the quadratic electro-optic effect, $[\Delta(n^{-2})]_{ij}=\Sigma_{k,l}g_{ijkl}P_kP_l$, reveals very large g values, 20-100 times larger than those observed in Pb perovskites. (18 refs.)

120008 Optical phenomena in $BaMnF_4$ near its phase-transition temperatures. R.V.Pisarev, B.B.Krichevtzov, P.A.Markovin, O.Yu.Korshunov (Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR), J.F.Scott.

Phys. Rev. B (USA), vol.28, no.5, p.2677-85 (1 Sept. 1983).

Measurements of indices of refraction, birefringence, and rotation of the optical ellipsoid $BaMnF_4$ near its incommensurate structural phase-transition temperature and near its two- and three-dimensional magnetic-ordering temperatures have been made. The results are compatible with a single structural phase transition at $T_I=251$K for the sample used. Small jumps of all measured quantities have been found at T_I that proves the transition to be of first order. The point-group symmetry below T_I is shown to be 2 (C_2) or lower, as a result assumed before but never confirmed directly. The optical ellipsoid rotates $\sim4'$ as temperature is lowered below T_I. Optical activity tensor component $G_{33}=5\times10^{-5}$ was measured below T_I. Quite unexpectedly the rotation of the optical ellipsoid and the optical activity were found to be temperature independent. Contrary to that, the anomalous part of the index of refractive close to T_I varies with temperatures as $\langle(\zeta^2+\eta^2)\rangle$ in both phases, where ζ and η are components of the order parameter. In the high-temperature phase $Ama2_1$ ($C_{2v}{}^{12}$) close to T_I this varies as $(T-T_I)^{1/2}$ in agreement with theoretical estimations. Fluctuational contributions to the indices of refraction and to the birefringence persist up to $\sim$350K. In the low-temperature phase the order-parameter contribution to the index of refraction is found to vary with the critical exponent $\beta=0.28$. The magnetic contribution to the refractive index at low temperatures is obtained, the highest value being $\sigma n_c\simeq1\times10^{-3}$. (26 refs.)

120009 Parametric distortion of the optical-absorption coefficient of semiconductors by an additional infrared laser. R.M.O.Galvao, L.C.M.Miranda (Divisao de Fisica Teorica, Inst. de Estudos Avancados, Centro Tecnico Aeroespacial, Sao Paulo, Brazil).

Phys. Rev. B (USA), vol.28, no.6, p.3593-6 (15 Sept. 1983).

The distortion of the optical-absorption coefficient of a direct-gap semiconductor is investigated when the semiconductor is subjected to an additional IR laser field. It is shown that, when the IR laser intensity increases, the absorption coefficient develops a tail below the zero-field gap. An application is made for the case of InSb irradiated by an intense CO_2 laser. (15 refs.)

120010 Investigation of the optical absorption of doped rutile. V.M.Arutyunyan, A.O.Arakelyan, G.A.Kurbatov, Zh.R.Panosyan, A.G.Sarkisyan, K.K.Sidorin, Yu.V.Shmartsev (State Univ., Erevan, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.3, p.543-4 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.942-4 (March 1983). [received: Oct. 1983]

The authors report the results of an investigation of the spectral dependence of the optical absorption coefficient (α) of single-crystal and polycrystalline samples of rutile both undoped and doped with chromium, vanadium, and aluminum. The spectral dependences of α for rutile single crystals were obtained in a wide spectral range where α varied from about 10^6 cm^{-1} to 1 cm^{-1}. (11 refs.)

120011 Optical properties of $In_{0.5}Ga_{0.5}P$ epitaxial films. D.Z.Garbuzov, E.V.Tulashvili, V.P.Evtikhiev, I.N.Arsent'ev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.551-2 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1281-5 (Nov. 1982). [received: Sept. 1983]

The authors report a study of the spectra of the refractive index and absorption coefficient for $h\nu<Eg$ in $In_{0.5}Ga_{0.5}P$ solid solutions. This material has attracted interest because of its direct gap structure with a gap size $E_g{}^{\Gamma}=1.9$ eV (300K). The $In_{0.5}Ga_{0.5}P$ lattice constant is the same as that of GaAs, substantially simplifying the procedure for fabricating $In_{0.5}Ga_{0.5}P$ epitaxial films. The specific technique used to synthesize $In_{0.5}Ga_{0.5}P$ epitaxial films on GaAs substrates by liquid-phase epitaxy has been described previously along with the luminescence properties of these films. There is, however, essentially no information available on the spectra of the refractive index or the absorption coefficient for $In_{0.5}Ga_{0.5}P$ epitaxial films. The present experiments were carried out to bridge this gap and to compare the optical properties of $In_{0.5}Ga_{0.5}P$ with those of $A^{III}B^V$ binary compounds. (6 refs.)

120012 Opalescence in $Na_{0.5}Bi_{0.5}TiO_3$ crystals. I.P.Pronin, P.P.Syrnikov, V.A.Isupov, G.A.Smolenskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.563-4 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1309-12 (Nov. 1982). [received: Sept. 1983]

Sodium bismuth titanate, $Na_{0.5}Bi_{0.5}TiO_3$ (NBT), is one of the complex perovskites in which identical crystal sites are occupied by ions of different species with difference valences. The most interesting aspect of the behavior of NBT is the onset of isotropy in this crystal at a certain temperature in the antiferroelectric region. At the isotropy temperature there is a very pronounced thermal hysteresis (on the order of 50°C). Single crystals of NBT, greenish-yellow in color, are opalescent at room temperature. It was observed visually that these crystals become transparent when heated. Since there is essentially no change in color, it was suggested that there is a change in the intensity of the light scattering. For a more objective estimate of the scattering the authors studied the temperature dependence of the optical transmission. They assumed that, whatever the contributions of the reflection and the absorption, they are relatively small and vary monotonically with the temperature. Accordingly, the transmission curves can be used to determine the change in the light scattering intensity with temperature. (6 refs.)

120013 On the optic-refractometric regularity of nonmetal isotropic substances. A.N.Borets.

Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1346-50 (Sept. 1983). In Russian.

The validity of optic-refractometric (OR) correlation is demonstrated on examples of 25 nonmetal substances. The OR correlation is more general and precise than other known relations. The OR-parameter (quasi-constant) η_3 practically coincides with the inverse value of the correction factor α in Slater's Xα-method. The OR-regularity of dispersion in a high-energy part of transparent region and the OR-criterion of nonmetallicity are discussed. (19 refs.)

120014 On refractometric evaluation of properties of boundary layers of elastomers. L.M.Pritykin, V.L.Vakula.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1887-91 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The method of calculation of density and coefficient of packing of elastomers in boundary layers is proposed based on ellipsometric measuring of refraction indexes on the interface. The relation of found characteristics with properties of elastomers in interphase and on the boundary with air is discussed. The proposed approach permits to be obtained the quantitative information about the behaviour of elastomers in conditions of interphase contact. (15 refs.)

120015 On the applicability of electron dynamic models for determining the refractive index of mixtures. W.Burckhardt, P.Bussemer, U.Deitrich (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.87-91 (1983). In English.

Experimental values of the optical index of glasses in two special binary compositions are compared with the predictions of electrodynamic models. The agreement is rather good for the composition As_2S_3-As_2Se_3 (uniform short range order). Deviations occur at the composition As_2Se_3-Se which are due to differences in the short-range order of the two original substances. (7 refs.)

120016 Electrodynamic models for the optical refractive index and their application to binary mixtures. U.Deitrich, P.Bussemer (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.93-8 (1983). In English.

Different macroscopic-electrodynamical models for the calculation of the dielectric function $\bar{\epsilon}(\omega,x)$ of a mixture (ω: frequency, x: composition) are discussed using a unifying point of view starting from the relationship between the macroscopic field E and the internal field E^{int}. Onsager's model of dipole coupling allows a direct derivation of the effective medium approximation (EMA) for binary mixtures. (16 refs.)

120017 Studies in some physical properties of amino acids. I. Specific rotations, apparent molal volumes and adiabatic compressibilities of *l*-amino acids in mixed solvents. D.V.Jahagirdar, S.U.Pankanti (Chem. Dept., Marathwada Univ., Aurangabad, India).
Indian J. Chem. A, vol.22A, no.3, p.195-7 (March 1983). [received: Oct. 1983]
Specific rotations, apparent molal volumes (ϕ_v) and adiabatic compressibilities (ϕ_{Ks}) have been determined for a few *l*-amino acids in aqueous solutions and in water-dioxane mixtures. The change in specific rotation is not identical for isodielectric mixtures, viz. ethanol-water, methanol-water and dioxane-water. The ϕ_v and ϕ_{Ks} have been utilised to calculate the hydration number (n_H) of *l*-tryptophan in 10, 20 and 40% dioxane-water mixtures. The n_H values obtained by the two methods show satisfactory agreement and point out that in the initial stages of addition to water, dioxane does not interfere in the primary hydration of *l*-tryptophan. 78.20F Birefringence

(inc. stress birefringence, flow birefringence, etc)

120018 Picosecond photoinduced optical anisotropy in trans-$(CH)_x$: direct measurement of soliton diffusion. Z.Vardeny (Dept. of Phys., Brown Univ., Providence, RI, USA), J.Strait, D.Moses, T.-C.Chung, A.J.Heeger.
J. Phys. Colloq. (France), vol.44, no.C-3, p.403-5 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Photoinduced dichroism caused by bleaching of the interband transition in trans-$(CH)_x$ was observed in the picosecond time domain. The bleaching is induced instantaneously and decays with time as $t^{-1/2}$, changing to a lower power after ~ 50 ps. Although the photoinduced bleaching persists to long times, polarization memory is lost after~10^{-9} s. The results provide a measurement of the diffusion constant of the charged excitations; $D \simeq 2 \times 10^{-2}$ cm^2 s^{-1} at 300K and 80K. (10 refs.)

120019 Applications of the modulated liquid crystal-linear dichroism (LC-LD) to spectro- and stereo-chemical problems. III. B.Samori (Facolta di Chimica Industriale, Bologna, Italy).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.385-97 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
For pt.II see J. Chem. Soc. Perkin Trans., vol.2, p.446 (1982). The instrument, apparatus, and some new details the set-up for measurements using LC-LD techniques are reported. Some applications of LC-LD information previously published by the author are collected and reviewed in order to give some examples of the usefulness of the technique in solving spectro- and stereo-chemical problems. The manner in which LC-LD information about the symmetry of electronic states can be applied both to assign electronic transitions and demonstrate that a molecule that is achiral in its electronic ground state can become chiral in an excited state, is presented. Distortions induced in solute molecules by liquid crystalline solvents can be demonstrated by LC-LD, and stereochemical models of induction of cholesteric mesophase have been proposed on the basis of LC-LD orientational information. (16 refs.)

120020 Orientation and relaxation in uniaxially stretched atactic polystyrene. D.Lefebvre, B.Jasse, L.Monnerie (Lab. de Phys.-chimie Structurale et Macromoleculaire, Ecole Superieure de Phys. et de Chimie Industrielles de la Ville de Paris, Paris, France).
Polymer (GB), vol.24, no.10, p.1240-4 (Oct. 1983).
Infrared measurements of the dichroic ratio of atactic polystyrene absorption bands provide a valuable method of determination of orientation as well as relaxation of chains during stretching. Different strain rates and temperatures of stretching were used. Orientation relaxation was analysed using Lodge's (1956) constitutive equation and a master curve was obtained at a reference temperature T_0=115°C. Orientation relaxation behaves similarly to mechanical relaxation and a scaling factor of 3.6×10^{-8} m^2 N^{-1} holds between the two sets of results. (16 refs.)

78.20H Piezo-, elasto- and acousto-optical effects

120021 High-pressure optical absorption and X-ray-diffraction studies in RbI and KI approaching the metallization transition. K.Asaumi, T.Suzuki, T.Mori (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Rev. B (USA), vol.28, no.6, p.3529-33 (15 Sept. 1983).
The pressure dependence of the fundamental optical absorption edges in RbI and KI crystals has been investigated up to 70 GPa at room temperature by using high-pressure apparatus of sapphire and diamond anvil types. The absorption edges in RbI and KI are found to show some complicated behaviors below ~5 GPa within the UV region. Beyond ~5 GPa, absorption edges decrease monotonically with increasing pressure up to 70 GPa. The X-ray-diffraction study shows that the CsCl-type crystal structure remains stable up to 67 GPa after the NaCl- to CsCl-type phase transition at 0.4 GPa for RbI and at 1.9 GPa for KI, respectively. The metallization pressures of RbI and KI are estimated to be approximately 85 and 115 GPa, respectively. (12 refs.)

120022 Influence of the polarization of injection laser radiation on the efficiency of the acoustooptic interaction in anisotropic crystals. V.A.Kondrat'ev, V.N.Morozov, Yu.M.Popov, G.I.Semenov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.387-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.638-40 (March 1983). [received: Oct. 1983]
A study was made of the polarization characteristics of the radiation emitted by double-heterostructure AlGaAs injection lasers and of the influence of these characteristics on the efficiency of scattering of laser radiation by volume acoustic waves in a crystal of paratellurite. The efficiency of the acoustooptic interaction increased linearly on increase in the degree of linear polarization of the incident radiation. When the plane of polarization of this radiation was rotated relative to the scattering plane by 90° from the optimal position, the efficiency of this interaction was more than halved. The central frequency of an ultrasonic cell for the interaction with radiation of wavelength $\lambda=0.9$ μ was 50 MHz and the efficiency of the interaction was ~50%. (3 refs.)

78.20J Electro-optical effects

120023 Comparative studies of mercury cadmium telluride single crystal and epitaxial. P.M.Raccah, U.Lee (Univ. of Illinois, Chicago, IL, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1587-92 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The authors have carried out a systematic study of mercury cadmium telluride (MCT), bulk single crystal and epilayers, using electrolyte electroreflectance (EER). Their results, and others discussed here, suggest that much of the unusual properties of this material are due to structural microdomains. Under mechanical stresses or chemical attack, the walls of these domains tend to move via the generation and propagation of defects associated with cationic diffusion. A typical consequence is the creation of *n*-type zones within a *p*-type matrix. They have calibrated their etch rate so as to be able to apply EER to the study of the profiles of epilayers with a depth resolution of 200 Å. The technique was applied to more than 100 samples of all origins. The results are summarized here in qualitative terms, such as typical profile features, as well as in quantitative terms, such as compositional variations and defect densities. EER results are integrated within the conceptual framework introduced above and compared to SIMS and microprobe results. (19 refs.)

120024 Computer simulation of a nematic guest-host display. F.Gharadjedaghi (ASULAB SA, Neuchatel, Switzerland).
J. Appl. Phys. (USA), vol.54, no.9, p.4989-93 (Sept. 1983).
The steady state electrooptical behavior of a dichroic type of display cell using a nematic mixture with positive dielectric anisotropy is considered. This study makes use of a mathematical simulation method. Numerical results obtained from this method are in very good agreement with experiment. The effect of physical and technological parameters of the system on the form of the transmission-voltage characteristic is studied and in particular the slope of this characteristic in the neighborhood of the threshold voltage. The role played by the twist angle is especially considered. (10 refs.)

120025 Electrooptical properties of thin films of polyheterocycles. M.Gazard, J.C.Dubois, M.Champagne, F.Garnier, G.Tourillon (Thomson-CSF Lab., Domaine de Corbeville, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.537-42 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Some conducting polyheterocycles prepared by electroinitiated polymerization as thin films on electrodes change colour reversibly when they are electrochemically cycled. As an example, polypyrrole is synthetized in an oxidized form and may be reduced reversibly between 0 and 0.7 volt vs. SCE. The modified electrode changes from brown to yellow during the cycling of the potential. Other colors may be obtained with other heterocycles. The electrochemical properties of some polyheterocylces have been determined and their characteristics—optical density, switching speed, ageing effects—are compared to those of other electrochromic organic materials. (11 refs.)

120026 Electro-optical behavior of a novel strong-weak and weak-weak anchored large-pitch cholesteric. H.P.Hinov, E.Kukleva, A.I.Derzhanski (Inst. of Solid State Phys., Sofia, Bulgaria).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.109-24 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The electro-optical behavior of strong-strong, strong-weak and weak-weak anchored tilted and reversely-tilted large-pitch cholesterics has been investigated. The weak anchoring has been achieved after rubbing with soap the previously mechanically-rubbed glass plates. Under a voltage excitation, the most important reversely-tilted weak-weak anchored cholesteric layers giving rise to a nearly-planar Grandjean-like texture showed the appearance of a Helfrich's instability, followed by a $\pi/2$ rotation of the helix and finally, a scroll texture which compactly disappeared into a completely unwinded cholesteric. When voltage was switched off, the unwinded cholesteric was returned to the initial Grandjean-like texture for the case of a low voltage ($U<3U_{th}$, where U_{th} is the threshold voltage for the Helfrich's instability) or has been transformed into a finger-print texture for higher voltages. This novel boundary-induced bi-stability is related to the weakness of the surface anchoring. In addition, attention has been paid on the important electro-optical behavior of the well-known, however insufficiently investigated, finger-print texture embedded into a homeotropic matrix. (70 refs.)

120027 Two-photon interband absorption of light in semiconductors in external parallel electric and magnetic fields. P.K.Katana (V.I. Lenin State Univ., Kishinev, USSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.89-98 (1 Sept. 1983).
The constant of the two-photon interband absorption of light (TPA) in a semiconductor placed in external, parallel quantizing electric and magnetic fields is calculated. It is shown that the TPA constant near each Landau level must have an oscillatory behaviour due the presence of discrete Stark levels, that is, at high electric field strengths the 'Stark ladder' must be observed. The following particular cases are considered: the one-photon absorption (OPA), the two-photon electro-absorption (TPEA), and the two photon magnetoabsorption (TPMA). (20 refs.)

120028 Kerr constants of random coil polypeptides. A.Lopez-Pineiro (Dept. de Quimica Fisica, Univ. de Extremadura, Badajoz, Spain), M.P.Tarazona, E.Saiz.
Polym. Bull. (Germany), vol.10, no.7-8, p.373-80 (Sept. 1983).
Calculations of average molar Kerr constants $<_mK>$ of polypeptides of the twenty natural α-aminoacids in the random coil state are presented. The computation was carried out according to the rotational isomeric states model with the values of energies, dipole moments and optical anisotropies of the repeating units reported elsewhere. In the case of homopolypeptides, the ratios $<_mK>/x$ extrapolated to $x \rightarrow \infty$ range approximately from -6000 to $+5000$ in units of $10^{-27} V^{-2} m^5 mol^{-1}$. Results obtained for ten actual proteins and three enzymes in the random coil state are also reported; their values of $<_mK>/x$ are very sensitive to the kind of aminoacid residues and to the sequence of those residues. (15 refs.)

120029 Numerical investigation of the plasma electroreflectance model at lead and indium electrodes. E.M.Podgaetskii, M.I.Urbakh (Inst. of Electrochem., Acad. of Sci., Moscow, USSR).
Sov. Electrochem. (USA), vol.19, no.1, p.55-60 (Jan. 1983). Translation of: *Elektrokhimiya (USSR)*, vol.19, no.1, p.61-6 (Jan. 1983). [received: Sept. 1983]
The plasma electroreflectance mechanism is discussed for lead and indium electrodes in terms of a microscopic theory of light reflection from metals. The calculation is performed for s- and p-polarized light. It is shown that the electroreflectance signal obtained in p-polarized light is determined, not only by the double-layer capacitance but also by the potential dependence of the characteristic length of electron density decay outside the metal. The results of the numerical calculations are compared with experimental data. (14 refs.)

120030 Electrogyration in $AgGaS_2$ and $CdGa_2S_4$ crystals. O.G.Vlokh, A.V.Tsarik, I.M.Nekrasova.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1334-8 (Sept. 1983). In Russian.
Electrogyration coefficients γ_{41} are determined for $AgGaS_2$ and $CdGa_2S_4$ crystals at wavelengths of 498 and 489 nm, which correspond to inversion points of the birefringence sign: $\gamma_{41}=2.03.10^{-12}$ m/V and $\gamma_{41}=1.52\times10^{-12}$ m/V. (10 refs.)

78.20L Magneto-optical effects

120031 The low triplet state of tetramethyl-1,3-cyclobutanedithione. III. Single-crystal Zeeman spectroscopy. J.Baiardo, M.Vala (Dept. of Chem., Univ. of Florida, Gainesville, FL, USA), I.Trabjerg.
Chem. Phys. (Netherlands), vol.80, no.3, p.305-15 (15 Oct. 1983).
For pt.II see ibid., vol.79, p.403 (1983). Pulsed, high-field Zeeman spectra of the lowest singlet-to-triplet transition in single-crystal tetramethyl-1,3-cyclobutanedithione (TMCBDT) have been measured. The analysis of the spectra was performed using an extension of the theory of Casto and Hochstrasser (1968) which allows for an arbitrary alignment of the magnetic field with respect to the principal crystal axes. The authors provide evidence that in TMCBDT (1) the lowest triplet is ^3A_u (D_{2h} molecular symmetry), (2) only one spin-orbit coupling route is active, (3) a substantial zero-field splitting (2.5 ± 1.0 cm^{-1}) is present, (4) the magnetic and molecular axes are rotated by 90°,and (5) the spin-orbit contribution to the triplet-state g value is small compared to its effect on the zero-field splitting parameters. (13 refs.)

120032 Spin-orbit splitting of Γ exciton bands in RbI and KI. R.Onaka, H.Iwamoto (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3248-53 (Sept. 1983).
The exciton absorption bands in Rb and KI are studied by means of magnetic circular dichroism spectra, and their effective g-values are obtained. From the sign of the g_{eff}-values, it is concluded that the lowest two sharp absorption bands, E_1 and E_2, are $(\Gamma_8{}^-; \Gamma_6{}^+)$ and $(\Gamma_6{}^-; \Gamma_6{}^+)$ excitons, respectively, which are split by the spin-orbit interaction of iodine $5p$ electrons. The higher energy bands, E_3 and E_4, are probably the exciton bands produced by excitation of halogen $5p$ electrons to the d-like conduction bands at X and L points in the Brillouin zone. (14 refs.)

120033 On the optimum method of analysis of Faraday rotation and ellipticity measurements in a metal-oxide-semiconductor system. R.F.O'Connell, G.Wallace (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.951-3 (1983).
The authors have previously calculated the Faraday rotation θ and ellipticity δ due to the two-dimensional electron gas at the oxide-semiconductor interface of a metal-oxide-semiconductor system. The results depend on such parameters of the system as the effective mass m^*, the relaxation time τ, and the electron surface concentration N, and in fact the motivation is to enable one to determine such parameters from measurements of θ and δ. Here they discuss the optimum method for the determination of these parameters from the data. In particular, they argue that it is more desirable to carry out measurements at fixed magnetic field B and variable photon frequency w, rather than at fixed w and variable B. They also demonstrate how the analysis can be used to determine the predicted dependence of τ on magnetic field, without explicit knowledge of m^* or N. (10 refs.)

120034 Relationship between Faraday rotation and Hall effect in amorphous rare-earth-transition-metal alloys. M.Hartmann (Philips Res. Labs., Hamburg, Germany), T.R.McGuire.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1194-7 (26 Sept. 1983).
The Faraday rotation and spontaneous Hall effect were investigated in amorphous thin films with compositions $(GdFe)_{1-x}M_x$ (M=Bi, Sn, Au). Bismuth and tin are found to increase the Faraday rotation, ϕ_F, the Hall resistivity, ρ_H, and the sample resistivity, ρ, while Au decreases ϕ_F, ρ_H, and ρ as compared to values observed for GdFe. Specifically, ϕ_F is proportional to the Hall angle (ρ_H/ρ). A model first proposed by Voigt is developed to account for this proportionality. (25 refs.)

120035 Identification of residual donors in high-purity epitaxial GaAs with the use of magneto-optical spectroscopy. D.C.Reynolds, K.K.Bajaj, C.W.Litton, E.B.Smith (US Air Force Wright Aeronautical Labs., Wright-Patterson Air Force Base, OH, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3300-5 (15 Sept. 1983).
The authors report the first identification of residual donors in high-purity vapor-phase epitaxial GaAs using the photoluminescence technique in the presence of applied magnetic fields. Identifications were made from complexes of the neutral-donor-bound-exciton type in which the transitions occurred between excited initial and final states of the complex. The same residual donors were identified from ionized-donor-bound-exciton complexes in the same crystal. These measurements were also made in applied magnetic fields. The magnetic field compresses the wave function which sharpens the optical transitions. It also separates the diffferent donors when viewed from neutral-donor-bound-exciton transitions. The magnetic field separation of different donors, when viewed from the ionized-donor-bound-exciton transitions, was not significant in fields up to 40 kG. An exchange energy of $\sim$30 μV was measured from the magnetic field splitting of the ionized-donor-bound-exciton π lines. (32 refs.)

78.20N Thermo-optical effects

120036 On the use of the thermal lens effect as a thermo-optical spectroscopy of solids. L.C.M.Miranda (Inst. de Estudos Avancados, Centro Tecnico Aeroespacial, Sao Jose dos Campos, Brazil).
Appl. Phys. A (Germany), vol.A32, no.2, p.87-93 (Oct. 1983).
A theoretical model for the thermal lens effect due to the absorption of modulated light by a solid is presented. The discussion includes an analysis of the modulation frequency response of the temperature rise in the solid. It is suggested that this effect may be used as a new technique for studying the thermo-optic properties of solids. (18 refs.)

120037 Fundamental optical properties of In halides. A.Borghesi, G.Guizzetti, L.Nosenzo, E.Reguzzoni, A.Stella (Dipartimento Fisica 'A. volta', Univ. di Pavia, Pavia, Italy), F.Levy.
Solid State Commun. (USA), vol.48, no.4, p.345-8 (Oct. 1983).
Reflectance and thermoreflectance spectra between 2 and 9 ev have been measured for InBr and InI crystals. A correlation between optical structures and electronic levels is proposed taking into account the X-ray photoelectron spectroscopy data and the expected similarity of In and Tl halides band scheme. (20 refs.)

78.30 INFRARED AND RAMAN SPECTRA AND SCATTERING

120038 Use of CuO in obtaining approximate depolarization ratios of colorless solids. D.P.Strommen, K.Nakamoto (Dept. of Chem., Marquette Univ., Milwaukee, WI, USA).

Appl. Spectrosc. (USA), vol.37, no.5, p.436-9 (Sept.-Oct. 1983).

The authors have developed a new method by which approximate depolarization ratios may be determined for colorless compounds in the solid state. Through the addition of CuO or carbon black, they were able to obtain reasonable values for vibrational modes of K_2SO_4, $Na[Ag(CN)_2]$, $W(CO)_6$, and benzophenone. The function of these colored additives appears to be that of reducing the depth of penetration of the laser beam and consequently attenuating the amount of reflected or refracted radiation which will have been scrambled with respect to polarization. (10 refs.)

120039 Raman spectra of sodium sulphamate single crystal. P.Muthusubramanian, A.Sundara Raj (School of Phys., Madurai Kamaraj Univ., Madurai, India).

Can. J. Chem. (Canada), vol.61, no.9, p.2048-52 (Sept. 1983).

Vibrational assignments are proposed for solid $NaNH_2SO_3$ on the basis of room temperature polarized Raman spectra of single crystals. Infrared data for the region 4000-50 cm $^{-1}$ of the polycrystalline sample are also presented. The results indicate that (1) there is no water of crystallization, (2) the hydrogen bonding is extremely weak, and (3) the strength of N-S bond is stronger than in sulphamic acid. (14 refs.)

120040 Surface-enhanced Raman spectroscopy of water: implications of the electromagnetic model. C.G.Blatchford, M.Kerker, D.-S.Wang (Clarkson Coll. of Technol., Potsdam, NY, USA).

Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.230-5 (9 Sept. 1983).

The electromagnetic model of surface-enhanced Raman scattering is used to show that in colloidal sols the failure to observe enhanced Raman signals from adsorbed water or even from a macroscopic layer of water near the surface is due not only to the small Raman cross section of water and the fact that any such enhanced signal is overwhelmed by that from the bulk water, but also because of the high wave number of the vibrational mode of water. (39 refs.)

120041 The role of cavity sites in surface-enhanced Raman scattering. H.Seki, T.J.Chuang (IBM Res. Lab., San Jose, CA, USA).

Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.393-6 (23 Sept. 1983).

Thermal desorption spectra (TDS) of pyridine from silver films deposited in ultra high vacuum are reported. Marked differences in the TDS are seen depending on the deposition conditions and the thermal history of the films, which have been correlated with surface-enhanced Raman scattering (SERS). These results as well as some of the observations in electrochemical systems are discussed in light of the recent Xe probe analysis carried out by Albano et al. (36 refs.)

120042 An investigation of the far infrared optical properties of $Hg_{1-x}Cd_xTe$. T.N.Casselman, G.L.Hansen (Honeywell Corporate Technol. Center, Bloomington, MN, USA).

J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1683-6 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).

Details results of a study of the optical absorption spectrum of *n*- and *p*-type $Hg_{1-x}Cd_xTe$ for wavelengths from below the band gap to 40 μm. The authors identify both intervalence band and multiphonon lattice absorption in the data, and have tentatively identified free electron absorption using Jensen's (1982) theoretical model. The intervalence band absorption data are compared to the predictions of a theoretical model. Tentative phonon frequency assignments are made for some of the more prominent multiphonon peaks. (7 refs.)

120043 Raman scattering in $Hg_{0.8}Cd_{0.2}Te$. P.M.Amirtharaj, Kwong-Kau Tiong, F.H.Pollak (Phys. Dept., Brooklyn Coll., City Univ. of New York, New York, NY, USA).

J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1744-8 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).

The authors report the first polarization dependent Raman scattering study in $Hg_{0.8}Cd_{0.2}Te$ from the (100) and (111) faces. The Raman spectra were recorded in the back scattering geometry at 77K using several lines of an Ar^+ laser near resonance with the E_1 optical gap. The study leads to an unambiguous identification of the HgTe and CdTe-like transverse optical (TO) and longitudinal optical (LO) phonon features. The HgTe-like TO and LO phonons occur at 122 ± 1 cm^{-1} and 140 ± 1 cm^{-1} and the CdTe-like LO phonon occurs at 156 ± 1 cm^{-1}; the CdTe-like TO-LO splitting was too small to be observable. The presence of a symmetry forbidden HgTe-like TO phonon from the (100) face indicates the presence of defects or disorder. A defect mode was observed at ~ 108 cm^{-1}. In addition, an extremely surface sensitive feature was seen at 132 cm^{-1} and has been tentatively assigned to a coupled LO phonon-intersubband excitation from the natural occurring surface inversion layer. A strong feature observed at 135 cm^{-1} may arise from clustering effects. (15 refs.)

120044 The effects of ion-implantation damage on the first-order Raman spectra of GaP. D.R.Myers, P.L.Gourley, P.S.Peercy (Sandia Nat. Labs., Albuquerque, NM, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5032-8 (Sept. 1983).

The authors have analyzed the effects of ion-implantation-induced damage on the first-order Raman spectra of GaP, and have correlated changes in the Raman spectra with direct measurements of implantation-induced surface stresses. The authors find that, at low ion fluences, the effects of implantation damage are to produce point defects that remove free carriers from doped material and to produce stresses in the undamaged regions. In this regime, the stress-induced shifts of the Raman lines can be predicted from the known elastic constants of undamaged GaP. At intermediate fluences, implantation damage alters the elastic properties of GaP so that the stress-induced shifts of the Raman lines are less than those predicted from the properties of the undamaged crystal. At higher doses, implantation-induced surface stresses exceed the elastic limit of the damaged material. This plastic deformation of the implanted surface is accompanied by a rapid broadening of the phonon lines in the first-order Raman spectra. (31 refs.)

120045 Characterization of transplutonium orthophosphates and trimetaphosphates by Raman spectrophotometry. D.E.Hobart (Dept. of Chem., Univ. of Tennessee, Knoxville, TN, USA), G.M.Begun, R.G.Haire, H.E.Hellwege.

J. Less-Common Met. (Switzerland), vol.93, no.2, p.359 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given. The authors study multimicrogram samples of crystalline transplutonium (Am-Es) orthophosphates and trimetaphosphates by Raman spectroscopy. The positions and relative intensities of the Raman spectra peaks obtained from the transplutonium orthophosphates were found to be quite similar to those of the lighter lanthanide (La-Gd) monoclinic orthophosphates and quite different from those of the heavier lanthanide (Tb-Lu) tetragonal orthophosphates. Also, Raman spectra of the trimetaphosphates were discernible from the Raman spectra of the orthophosphates. By applying the correlations established from Raman studies of the lanthanide orthophosphates and trimetaphosphates to the transplutonium compounds, it was possible (1) to assign the major Raman bands to specific phosphate vibrational frequencies, (2) to identify the stoichiometry and/or composition of the phosphate compounds and (3) to confirm the crystal environment of the compound. In addition to the above assessments, it was also possible to determine the presence of and follow the in-growth (via radioactive decay) of $^{249}BkPO_4$ into samples of $^{253}EsPO_4$ using the laser-excited fluorescence of the berkelium. (1 ref.)

120046 Vibrational study of the $[P_2S_6{}^{4-}]$ anion, of some MPS$_3$ layered compounds (M=Fe, Co, Ni, In$_{2/3}$), and of their intercalates with $[Co(\eta^5\text{-}C_5H_5)_2{}^+]$ cations. C.Sourisseau, J.P.Forgerit (Lab. de Spectrochemie et Raman, CNRS, Thias, France), Y.Mathey.

J. Solid State Chem. (USA), vol.49, no.2, p.134-49 (Sept. 1983).

The infrared and Raman spectra [10-3100 cm^{-1}] have been recorded for aqueous solutions and polycrystalling samples of $Na_4P_2S_6.6H_2O$ as well as for several lamellar MPS$_3$ (or $M_2P_2S_6$) compounds with M=Fe, Co, Ni, In$_{2/3}$ and their intercalates with cobalticenium cations. A complete assignment of the observed spectra is proposed and a normal coordinate analysis of the $[P_2S_6{}^{4-}]$ anion is carried out; this allows proposal of a new assignment, for the spectra of the layered MPS$_3$ host systems which is slightly modified with respect to prior work. A detailed analysis of the infrared and far-infrared spectra is also reported for the intercalates with $[Co(\eta^5\text{-}C_5H_5)_2{}^+]$ cations. From these results, it is concluded that the mechanism of the electronic transfer during the intercalation process depends on the nature of the metal: when M=Co or Ni the main reduction site is that P-P bond while when M=Fe (and perhaps also Mn) the reduction involves mainly the metal ion itself. (33 refs.)

120047 Infrared spectra of Cs_3CoCl_5. M.Natarajan, J.Quinn, E.A.Secco (Dept. of Chem., St. Francis Xavier Univ., Antigonish, Nova Scotia, Canada).

J. Solid State Chem. (USA), vol.49, no.2, p.258-61 (Sept. 1983).

The infrared spectra, transmittance, and polarized reflectance of Cs_3CoCl_5 are reported. The group theoretical analysis was executed and a vibrational assignment proposed on the basis of D_{4h} symmetry. Factor group and site effects are discussed. (8 refs.)

120048 Infrared study of the adsorption of $^{16}O_2$, $^{16}O^{18}O$ and $^{18}O_2$ on Cr_2O_3. P.J.M.Carrott, N.Sheppard (School of Chem. Sci., Univ. of East Anglia, Norwich, England).

J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2425-37 (Oct. 1983).

Absorption bands occur between 1030 and 850 cm^{-1} from the adsorption of oxygen $^{16}O_2$ on amorphous Cr_2O_3 and on crystalline α-Cr_2O_3 prepared according to the method of Zecchina et al. (1971). Broad overlapping absorptions occur for oxygen adsorbed on the amorphous oxide and multiple resolvable bands occur for crystalline α-Cr_2O_3. Through adsorption of pure $^{16}O_2$, pure $^{18}O_2$ and the $^{16}O_2 + ^{16}O^{18}O + ^{18}O_2$ equilibrium mixture it is clearly shown that all these absorptions arise from mono-oxygen surface species, probably approximating to Cr=O, on different sites. No bands from dioxygen species were observed. (17 refs.)

120049 Infrared spectroscopic study of pyridine adsorption on $MoO_3.NiO$ catalysts supported on fluorinated γ-Al_2O_3. L.G.Tejuca, C.H.Rochester (Dept. of Chem., Univ. of Dundee, Dundee, Scotland), A.L.Agudo, J.L.G.Fierro.

J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2543-58 (Oct. 1983).

Infrared spectra of adsorbed pyridine have been used to characterize Bronsted and Lewis acidic sites on fluorinated γ-Al_2O_3 (Al samples) and on $MoO_3.NiO$ supported on fluorinated γ-Al_2O_3 (MoNiAl samples). The Bronsted acidity of MoNiAl samples increased with increasing fluorine content. Also MoNiAl exhibited higher Bronsted acidity, but lower ability to form hydrogen bonds with pyridine, than Al samples. Partial desorption of pyridine at 673-873K revealed the presence of acid centres of different strengths. The strongest acid centres were probably associated with higher oxidation states of Mo or Ni. (21 refs.)

120050 Infrared studies of the effect of preadsorbed pyridine on the oxidation of butan-2-ol adsorbed on TiO_2. T.Nakajima, H.Miyata, Y.Kubokawa (Dept. of Appl. Chem., Univ. of Osaka Prefecture, Osaka, Japan).

J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2559-68 (Oct. 1983).

The influence of preadsorbed pyridine on the adsorption, dehydration and dehydrogenation of butan-2-ol on TiO_2 has been investigated by i.r. spectroscopy as well as by an analysis of the reaction products. Both reactions proceed via formation of butoxide species. In the presence of oxygen the major products from the butoxide are butenes, the formation of butanone being minor. The preadsorbed pyridine inhibits butene formation, while enhancing that of butan-2-one. In the absence of oxygen, only butenes are formed. On strong acid sites butanone formation is suppressed, butene formation being predominant. Adsorbed oxygen induces the production of basic sites which bring about butan-2-one formation. On weak acid sites butanone formation is the major reaction. (27 refs.)

120051 Laser Raman scattering spectroscopy of crystals. M.M.Sushchinskii, V.S.Gorelik.

J. Appl. Spectrosc. (USA), vol.38, no.1, p.80-93 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.91-110 (Jan. 1983). (40 refs.)

120052 Infrared reflectance and absorption of n-type InP. O.K.Kim, W.A.Bonner (Bell Labs., Murray Hill, NJ, USA).

J. Electron. Mater. (USA), vol.12, no.5, p.827-36 (Sept. 1983).

It has been shown that measurement of the infrared reflectance minimum frequency offers a simple, non-destructive method to determine carrier densities of n-type InP. Free carrier absorption has been measured for InP with carrier densities of $0.4\text{-}9 \times 10^{18}/cm^3$ in the spectral range of 1.1-10 μm and discussed in terms of optical phonon scattering and impurity scattering. In particular, the absorption at $\lambda = 1.3$ μm should be considered in the design of long wavelength photodetectors and light emitting diodes to improve external quantum efficiencies. (15 refs.)

120053 Preparation and properties of high quality polyacetylene. P.Knoll, H.Kuzmany, P.Surjan, M.Kertesz (Inst. fur Festkorperphys., Univ. of Vienna, Vienna, Austria).

J. Phys. Colloq. (France), vol.44, no.C-3, p.155-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).

By very careful sample preparation a trans-polyacetylene film was grown which showed an unusual weak high frequency component in the C=C stretch mode Raman line if excited with 4579 Å laser light. This is good evidence that the dispersion effect is of extrinsic origin rather than due to hot luminescence from long undisturbed conjugations. Degradation of the sample by irradiation hardly changes the line shape of the modes but increases the background scattering whereas oxidation enhances the high frequency part of the C=C stretch mode. A calculation of Raman line shapes within an extended version of the interrupted conjugation model gave very good agreement with experimental results and proved the very strong square root-like dependence of the transition matrix elements on the number of double bonds at least for short and medium long segments. (12 refs.)

120054 Doping and degradation of polyacetylene by nitric acid. D.Billaud, M.A.Haleem (Lab. de Chimie du Solide Mineral, Univ. de Nancy I, Nancy, France), S.Lefrant, S.Krichene.
J. Phys. Colloq. (France), vol.44, no.C-3, p.175-8 (June 1983). In French. (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The reaction of HNO_3 on trans $(CH)_x$ leads to two different reactions (doping and degradation) which have been followed by various physical measurements: variation in time of the electrical resistivity, IR and Raman spectroscopies and EPR. (5 refs.)

120055 Resonance Raman scattering induced by polyacetylene and derivatives. S.Lefrant (Lab. de Phys. Cristalline, Univ. de Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.247-54 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Recalls the main results obtained in Raman scattering on polyacetylene $(CH)_x$, cis or trans, and concentrates on the experimental point of view. New results are presented, essentially coming from the use of new excitation wavelengths, in the deep red region (λ_L=752.5 nm), and in the UV range (λ_L=333.6 nm). These results are discussed with the use of the theoretical models proposed by other authors. (22 refs.)

120056 Structural aspects of polyacetylene from resonance Raman scattering. H.Kuzmany (Inst. fur Festkorperphys., Univ. Wien, Wien, Austria).
J. Phys. Colloq. (France), vol.44, no.C-3, p.255-60 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The dispersion effect of resonance Raman scattering in trans-$(CH)_x$ is analysed within a model where the polymer consists of a distribution of undisturbed conjugations along the chains. The model is justified by the strong sample dependence of the dispersion and by the good agreement between calculated and observed line shapes. From the analysis of high quality samples 50% of the material was found to be in segments longer than 25 double bonds. Doping cis-$(CH)_x$ with AsF_5 is shown to induce isomerization and disorder. For more than 5% doping isomerization is complete and the resonance effect disappears from the highly doped crystalline areas. (17 refs.)

120057 Structural properties of trans $(CH)_x$ from absorption and resonant Raman scattering spectra analysis. G.P.Brivio, E.Mulazzi (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.261-5 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
A theoretical analysis of structural properties of trans$(CH)_x$ from resonant Raman scattering spectra is presented, taking into account the contribution of long and short conjugation length chains. (7 refs.)

120058 Near IR-optical absorption of undoped and doped $(CH)_x$. H.Kiess, G.Harbeke, B.J.Curtis, R.Keller (Labs. RCA Ltd., Zurich, Switzerland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.285-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The IR absorbance of undoped and weakly F, Cl, Br and I doped polyacetylene was measured in the spectral region from 0.125 to 1.05 eV. Doping induced absorption bands are observed which are not in quantitative agreement with existing soliton theory in terms of band position and magnitude of absorption. In addition the authors find very narrow metastable lines, in particular for doping with chlorine, at photon energies between 0.55 and 0.95 eV depending on the level of electrical conductivity. (9 refs.)

120059 Photo induced infrared active phonons in trans polyacetylene. Z.Vardeny, J.Orenstein, G.L.Baker (Phys. Dept., Technion-Israel Inst. of Technol., Haifa, Israel), J.Orenstein, G.L.Baker.
J. Phys. Colloq. (France), vol.44, no.C-3, p.325-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors measured photogenerated IR active phonons in trans-$(CH)_x$ by the photoinduced absorption technique. A correlation was found to exist with a photoinduced absorption band in which electronic transitions are involved. The results show photoproduction of free charged defects with long lifetimes. (16 refs.)

120060 Dispersion curves and resonant Raman spectrum of trans polyacetylene. R.Tubino (Istituto di Chimica delle Macromolecole, CNR, Milano, Italy), L.Piseri, G.Dellepiane, P.Piaggio.
J. Phys. Colloq. (France), vol.44, no.C-3, p.329-32 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The lattice dynamics of trans-polyacetylene is discussed and compared with the vibrational C=C and C—C stretching frequencies of short polyenes. The widths, the shape and the position of the Raman bands and their variation with the laser frequency are interpreted in terms of the lattice dynamical model. Some consideration on the selective resonant enhancement as a function of the lifetime of the photoexcitation are also presented. (12 refs.)

120061 Extended range optical absorption spectra of electrochemically doped trans $(CH)_x$. T.E.Jones, J.C.Hicks, D.L.Stierwalt, D.M.Cavanaugh, D.M.Gottfredson (Naval Ocean Systems Center, San Diego, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.333-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Thin (1000 Å) films of $(CH)_x$ were grown on KBr substrates to allow extended range optical absorption measurements to be performed from approximately 0.04 eV to 2.5 eV (300 cm^{-1} to 20000 cm^{-1}). Doping with ClO_4^- and AsF_6^- was performed and the IR spectral features were correlated with the midgap absorption and the interband transition. (10 refs.)

120062 Raman study of doped polyacetylenes. E.Faulques, S.Lefrant (Lab. de Phys. Cristalline, CNRS, Univ. de Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.337-40 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors present Raman scattering results obtained on doped polyacetylene films, using a variety of dopants including electron acceptors (I_2, Br_2, SbF_5, ClO_4, $FeCl_3$) and electron donors (Li for example). They show that a cis-trans isomerization is always induced upon doping. Compared to an undoped trans-$(CH)_x$, the doping process leads to a shortening of the trans sequences, if the model of the chain length distributions is valid. For all doped samples, an additional band is observed close to the C=C stretch Raman band at about 1600 cm^{-1}. (10 refs.)

120063 Optical properties of heavily doped polyacetylene films. O.Bernard (Groupe de Dynamique des Phases Condensees, Univ. de Sci. et Technol. du Languedoc, France), M.Palpacuer, C.Benoit, M.Rolland, M.J.M.Abadie.
J. Phys. Colloq. (France), vol.44, no.C-3, p.345-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The infrared transmission of thin films of polyacetylene has been measured for various doping levels ($0 \leq \gamma \leq 7\%$). The analysis of results shows that modes ω_1 (1400 cm^{-1}) and ω_2 (900 cm^{-1}) arising from structural defects are stable for $\gamma > 2\%$, and they persist in the metallic state. The authors show that ω_2 mode cannot be the pinned mode. (8 refs.)

120064 Raman scattering induced by undoped and doped polyparaphenylene. S.Krichene (Lab. de Physique Cristalline, CNRS, Univ. de Paris-Sud, Orsay, France), S.Lefrant, G.Froyer, F.Maurice, Y.Pelous.
J. Phys. Colloq. (France), vol.44, no.C-3, p.733-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Raman scattering results on polyparaphenylene samples prepared by two different methods are presented. The best spectra are obtained with an excitation wavelength in the UV range and the Raman bands are peaked at 1216 cm^{-1}, 1276 cm^{-1} and 1598 cm^{-1} for λ_L=334.8 nm. A comparison with Raman spectra induced by oligomers leads to a correlation between the intensity of the Raman band at $\simeq$1220 cm^{-1} and the number of phenyl rings present in the studied material. (5 refs.)

120065 Poly(para phenylene): Some properties related to the synthesis method. G.Froyer, J.Goblot, J.L.Guilbert, F.Maurice, Y.Pelous (CNET, Lannion B-ROC/TIC, Lannion, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.745-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Poly(para phenylene) can be obtained by different methods. The authors show the difference between two materials in terms of optical absorption, IR spectroscopy, DC conductivity and AsF_5 doping. According to these converging results, the chains of the polymer obtained by the Yamamoto method are shorter than those of the Kovacic polymer. (7 refs.)

120066 Vibrational spectra and structure of undoped and doped polyparaphenylene. Z.Iqbal (Inst. of Inorganic Chem., Univ. of Zurich, Zurich, Switzerland), H.Bill, R.H.Baughman.
J. Phys. Colloq. (France), vol.44, no.C-3, p.761-4 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Infrared and Raman spectroscopic data on undoped and AsF_5-doped polyparaphenylene (PPP), are presented. The results are discussed in terms of the normal mode calculation of Rakovic et al. (1982) and the bipolaron defect model of the doped polymer proposed by Bredas et al. (1982). (9 refs.)

120067 Infrared and optical properties of $TMTSF_2X$. C.S.Jacobsen (Phys. Lab. III, Tech. Univ. of Denmark, Lyngby, Denmark), D.B.Tanner, K.Bechgaard.
J. Phys. Colloq. (France), vol.44, no.C-3, p.859-65 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Some infrared and optical properties of the $TMTSF_2X$-materials are presented with special emphasis on the derivation of band structure parameters. The infrared conductivity of $TMTSF_2PF_6$ reflects the electron molecular vibration coupling, but also contains several unexplained features. (12 refs.)

120068 Far-infrared properties of $(TMTSF)_2ClO_4$ at low temperatures. H.K.Ng, T.Timusk (Dept. of Phys., McMaster Univ., Hamilton, Ontario, Canada), K.Bechgaard.
J. Phys. Colloq. (France), vol.44, no.C-3, p.867-72 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors report on a study of the reflectance of $(TMTSF)_2ClO_4$ in the spectral region 5-400 cm^{-1} between 2K and 58K. Kramers-Kroning analysis of the data shows that there is a region of low conductivity below 30 cm^{-1} in the *a* direction. There are two peaks (7 cm^{-1} and 25 cm^{-1}) in this gaplike region and one at 25 cm^{-1} is destroyed by a magnetic field of 2 kgauss. They attribute the region of high conductivity above 30 cm^{-1} to the Holstein process of phonon emission. (17 refs.)

120069 Far infrared properties of $(TMTSF)_2ClO_4$. W.A.Challener, P.L.Richards (Lawrence Berkeley Labs., Univ. of California, Berkeley, CA, USA), R.L.Greene.
J. Phys. Colloq. (France), vol.44, no.C-3, p.873-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The far infrared properties of $(TMTSF)_2ClO_4$ have been measured for frequencies between 4 and 40 cm^{-1}. At 2K, phonon-like peaks in reflectance are seen at 7 and 29 cm^{-1}. Increasing the temperature to 80K causes these peaks to gradually disappear, but not to shift appreciably in frequency. Radiation-induced defects substantially reduce the height of the 29 cm^{-1} peak. Experiments at 2.3K and 4.2K show no change in the 29 cm^{-1} peak with a magnetic field of up to 40 kG applied parallel to the c*-axis. These results suggest a coupled electronic-molecular vibration origin for these features. They are incompatible with the recently proposed interpretation of the 29

cm^{-1} feature as a quasione-dimensional superconductive pseudogap. (13 refs.)

120070 Peierls instability of the organic linear chain semiconductor TEA $(TCNQ)_2$ [Raman study]. E.F.Steigmeier, H.Auderset (Labs. RCA Ltd., Zurich, Switzerland), D.Baeriswyl, M.Almeida, K.Carneiro.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1445-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Raman spectra are reported on the organic linear chain semiconductor TEA $(TCNQ)_2$ between 4 and 300K. From the coupling coefficient, mostly of intermolecular modes, a measure for the order parameter variation of the Peierls distortion with temperature is derived. It shows a transition (3-dimensional ordering temperature T_{3d}) near 300K. The correlation of Raman with infrared results suggests a value of 1000 cm^{-1} (125 meV) for the Peierls pseudogap at 300K. (15 refs.)

120071 Infrared studies of phase transitions in single- and two-chain organic charge transfer conductors. R.Bozio, C.Pecile, P.Tosi (Inst. of Phys. Chem., Univ. of Padova, Padova, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1453-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The vibronic infrared absorptions of $MEM(TCNQ)_2$ are discussed in relation to the electronic- and spin-Peierls transitions and to the structural disorder. The roles of the donor and acceptor chains in the Peierls transitions of TMTTF-TCNQ, and HMTTF-TCNQ are demonstrated. (8 refs.)

120072 Spectral studies of the phase transitions in $MTPP(TCNQ)_2$ and $MEM(TCNQ)_2$. R.Swietlik, A.Graja (Inst. of the Molecular Phys., Polish Acad. of Sci., Posnan, Poland).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1457-60 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Infrared reflection and absorption spectra have been used to study the phase transitions in $MTPP(TCNQ)_2$ and $MEM(TCNQ)_2$ salts. The pronounced spectral changes due to the phase transition has been related to the observed spectral modifications. (13 refs.)

120073 Plasma reflectance of the one-dimensional organic metals of the type $(arene)_2XF_6$(arene=perylene, pyrene or fluoranthene; X=P, As, Sb). H.P.Geserich, B.Koch, W.Ruppel, R.Wilckens (Inst. fur Angewandte Phys., Univ. Karlsruhe, Karlsruhe, Germany), D.Schweitzer, V.Enkelmann, G.Wegner, G.Weiners, H.J.Keller.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1461-4 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors have investigated the spectral position and the form of the plasma edge of different radical cation salts of the type $(arene)_2XF_6$ as a function of the type of the organic donor molecule, and of the charge transfer between donor and acceptor molecules. (11 refs.)

120074 Far-infrared properties of trimethylammonium idodide tetracyanoquinodimethane. J.E.Eldridge, N.Fortier, F.E.Bates (Phys. Dept., Univ. of British Columbia, Vancouver, BC, Canada), J.S.Miller.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1465-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The authors present the powder absorption spectrum of (TMA)(I)(TCNQ) in the far-infrared as a function of temperature. Below 160K new absorption features appear and others increase in intensity. This behaviour supports the electron and neutron diffraction evidence of a distortion on the TCNQ chains below the first phase transition temperature of 159K (in the deuterated sample). (16 refs.)

120075 The low-temperature optical properties of TTF-TCNQ in the far-infrared. J.E.Eldridge, F.E.Bates (Phys. Dept., Univ. of British Columbia, Vancouver, BC, Canada).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1469-72 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The bolometric response of a crystal of TTF-TCNQ has been used to give indirectly the reflectivity R at 12K. The optical properties have been obtained from a Kramers Kronig analysis. The conductivity shows a strong resonance at 35 cm^{-1} attributed to the phase mode of the pinned charge-density wave, and strong mid-gap absorption due possibly to solitons. The calculated absorption coefficient agrees with that measured for powdered samples. (9 refs.)

120076 Vibrational spectroscopy of mixed stack organic semiconductors: comparison with segregated stack systems. A.Girlando, C.Pecile, A.Painelli (Inst. of Phys. Chem., Univ. of Padova, Padova, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1547-50 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The effects of the electron-molecular vibration interaction on the vibrational spectra of organic semiconductors with different type of stack are reviewed. The perturbation due to such interaction on the Raman frequencies of compounds characterized by regular mixed stack structure is shown. (9 refs.)

120077 The effect of substituents at benzoic ring on the parameters of cholesteryl benzoates infrared spectra in phase transitions. A.D.Laskovetz, I.I.Gorina, L.S.Gorbatenko, I.G.Chistyakov, G.V.Mikhailenko (Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.175-82 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Infrared spectra of cholesteryl benzoates, ortho and para Br cholesteryl benzoates, para ethoxy cholesteryl benzoates in crystalline, cholesteric and isotropic states as well as in dilute carbon chloride solutions have been obtained. The behavior of the absorption band of carbonyl group (C=O) stretching vibrations in cholesteryl benzoates was investigated. The results obtained are indicative of the strengthening of local intermolecular interactions in the cholesteric phase. (13 refs.)

120078 Effect of an electric field on the low frequency Raman spectrum of $KNbO_3$. T.Shigenari (Dept. of Engng. Phys., Univ. of Electro-Communications, Tokyo, Japan).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.63-5 (3 Oct. 1983).
The effect of an electric field on the low-frequency B_2 mode at 56 cm^{-1} in a $KNbO_3$ crystal has been observed as a small shift of the frequency in Raman spectrum. It means that the mode is not due to the disorder-induced TA modes with a flat dispersion but is a Brillouin zone center optical mode. However, the mode does not show clear ferroelectric soft-mode behavior as usually observed in other ferroelectrics. (7 refs.)

120079 Photoinduced IR-active vibrations in trans-$(CD)_x$: a three-mode system. Z.Vardeny (Dept. of Phys., Solid State Inst. Technion, Haifa, Israel).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1221 (26 Sept. 1983).
In a recent letter Blanchet et al. (1983) extended photoinduced absorption measurements of trans-polyacetylene to lower energy than obtained before, see Vandeny et al. (1983), for both isotopes, $(CH)_x$ and $(CD)_x$. While in (CH_x) three strong IR-active vibrations (IRAV) are photoinduced, only two IRAV were observed in $(CD)_x$, at $\omega_1=400$ cm^{-1} and at $\omega_2=1045$ cm^{-1}. This appeared strange, since from doping-induced IRAV and from resonant Raman scattering (RRS) it is known that $(CD)_x$ is also a three-mode system. Because of the asymmetry of the mode at 1045 cm^{-1}, it was suggested that two vibrations may be contained in this line, but high-resolution examination of the line failed to resolve it. The authors report a high-resolution photoinduced absorption measurement of $(CD)_x$ at 80K obtained with a double integration technique using a setup described before, see Vardeny et al. (1983), in which the authors have observed the third IRAV in $(CD)_x$. (4 refs.)

120080 Raman scattering resonant with quasi-two-dimensional excitons in semiconductor quantum wells. J.E.Zucker (Columbia Univ., New York, NY, USA), A.Pinczuk, D.S.Chemla, A.Gossard, W.Wiegmann.
Phys. Rev. Lett. (USA), vol.51, no.14, p.1293-6 (3 Oct. 1983).
Raman scattering resonant with quasi-two-dimensional excitons in GaAs-(Al_xGa_{1-x})As heterostructures shows enhancement profiles in agreement with exciton structure measured in other optical spectra. The profiles have characteristic asymmetries in the incoming and outgoing resonances that are specific to the exciton-optical-phonon interaction in quantum wells. Direct evidence of the degree of exciton confinement appears in the Raman spectra. (25 refs.)

120081 Interference between allowed and forbidden Raman scattering by longitudinal-optical phonons in GaAs. J.Menendez, M.Cardona (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1297-9 (3 Oct. 1983).
The amplitudes for the allowed and the forbidden (intraband Frolich) scattering by LO phonons are shown to interfere near resonances. This fact is illustrated with measurements on a (100) surface near the $E_0{}^+\Delta_0$ gap of GaAs. (13 refs.)

120082 Plasma reflection and hole optical effective mass in p-HgTe. V.I.Ivanov-Omskii, A.Sh.Mekhtiev, S.A.Rustambekova, E.N.Ukraintsev (Space Res. Sci. Industrial Enterprise, Acad. of Sci., Baku, Azerbaijan SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.159-69 (1 Sept. 1983).
The results of plasma reflection investigations in p-HgTe are decribed. It is show, that the plasma reflection spectrum shift towards small energies and the decrease of their depths with increasing temperature cannot be explained by the dielectric anomaly of the zero gap semiconductor due to the $\Gamma_8 \rightarrow \Gamma_8$ transition only. The analysis of the experimental results shows that the optical effective mass value has both, a temperature and concentration dependence. Such a dependence may be explained in the frame of the Kane theory, if the renormalization of the energy-spectrum of holes due to exchange electron-electron interaction is taken into account. (28 refs.)

120083 Comparison of fast electron and thermal annealing of proton bombarded silicon-X-ray and IR spectroscopy study. K.Biskupska, J.Tatarakiewicz, K.Wieteska (Inst. of Nuclear Res., Swierk, Poland).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K13-15 (Sept. 1983).
This note is the continuation of the authors' previous X-ray and IR spectroscopy study (see ibid., vol.66, p.K101, 1981) of thermal annealing of some silane band intensities and changes in contrast shape of proton bombarded silicon. They have noticed that a 600°C annealing step leads to the microscopic deformation of the sample. They present more details of their results as compared with fast electron annealing. Dislocation-free, 5 Ωcm, P-doped silicon single crystals were used. 9 MeV proton implantations were carried out at the INR linear accelerator ANDRZEJ. (4 refs.)

120084 Theory of far-infrared absorption in superconducting composites. J.Garner, D.Stroud (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2447-51 (1 Sept. 1983).
A simple model is described for the frequency-dependent conductivity of normal-superconducting composites. The superconducting component is characterised by the Mattis-Bardeen conductivity, and the composite conductivity is determined via the effective-medium approximation. Near the percolation threshold p_c there is strong absorption below twice the superconducting gap. Scaling arguments indicate that the authors' results have validity beyond mean-field theory. The model is in qualitative agreement with recent experiments on granular NbN films. (31 refs.)

120085 Raman studies of vitreous SiO_2 versus fictive temperature. A.E.Geissberger, F.L.Galeener (Palo Alto Res. Center, Palo Alto, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3266-71 (15 Sept. 1983).
The first-order Raman spectra of vitreous SiO_2 have been studied as a function of sample fictive temperature T_F for $900°C \leq T_F \leq 1550°C$. Three observations were made: (1) The broad features assigned to vibrations associated with the continuous random network of v-SiO_2 shift in frequency in a manner consistent with densification by reduction of the average Si-O-Si angle θ; (2) the sharp 'defect' lines at 492 and 606 cm^{-1} show little or no shift in frequency; (3) both defect line intensities exhibit Arrhenius behavior, $\exp(-\Delta E/k_B T_F)$, with well-defined activation energies ΔE of 0.14 and 0.40 eV, respectively. These observations are interpreted using a central-force network dynamics model and changes in the number of planar threefold and regular fourfold ring defects. (18 refs.)

120086 Importance of temperature-dependent optical properties for Raman-temperature measurements for silicon. G.E.Jellison, D.H.Lowndes, R.F.Wood (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3272-6 (15 Sept. 1983).
A standard relation of Raman scattering in the resonant regime is that the Raman matrix element R is well represented by $K\, d\epsilon/dE$, where ϵ is the dielectric function, E is the photon energy, and K is a constant. However, the only experimental check of this relationship in silicon [Renucci et al., Phys. Rev. B 11, 3885 (1975)] concluded that it was only approximately valid. It is shown for silicon in the resonant regime that the agreement between the measured values of the Raman matrix element squared, $\sigma=|R|^2$ and

$K^2|d\epsilon/dE|^2$, is very good indeed, if accurate values of the dielectric function are used. With the use of recently obtained temperature-dependent optical functions of silicon, the absorption coefficient, the Raman matrix element squared, the index of refraction, and the normal-incidence reflectivity are determined and shown to be strong functions of temperature in the resonant regime. The Stokes to anti-Stokes intensity ratio is calculated and found to compare favorably with values found in the literature for samples held at constant temperature. It is concluded that the temperature dependence of the optical properties must be included in any interpretation of measurements to determine the temperature from the Stokes to anti-Stokes intensity ratio. (20 refs.)

120087 Theory of phonon sideband resonances in Raman scattering from semiconductors. K.P.Jain, R.Gupta, N.C.Kothari (Dept. of Phys., Indian Inst. of Technol., New Delhi, India), M.Balkanski, M.Jouanne.
Phys. Rev. B (USA), vol.28, no.6, p.3362-71 (15 Sept. 1983).
A general many-body theory of phonon sidebands (replicas) of electronic transitions in semiconductors with shallow impurities is formulated. It is found that, in addition to the usual contribution to one-phonon sideband Raman amplitude due to the ordinary electron-phonon interaction term, there is another contribution which includes the effect of interaction between band electrons and electrons localized on the impurity site. The present theory, which is consistent with scattering from phonons and electronic transitions, is used to calculate the relative Raman amplitudes of $1s \rightarrow 2s$ electronic transition between the lithium acceptor states in ZnTe:Li and its LO-phonon sideband. Good agreement with experiment is obtained for electron-phonon interaction V, about 15 meV, and electron-electron interaction, J, ranging between 20 and 30 meV. (18 refs.)

120088 Raman scattering, defect luminescence, and phonon spectra of ^{7}LiH, ^{6}LiH, and ^{7}LiD crystals. A.Anderson, F.Luty (Dept. of Phys., Univ. of Utah, Salt Lake City, UT, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3415-21 (15 Sept. 1983).
Two types of phonon spectra, obtained by Ar^+-ion-laser irradiation of lithium hydride crystals, have been observed and analyzed for the three isotopic components ^{6}LiH, ^{7}LiH, and ^{7}LiD. Two-phonon Raman spectra of pure crystals were measured at 300 and 10K. One-phonon spectra were obtained from measurements of the resolved sideband structure of a strong zero-phonon emission line around 600 nm. This emission is produced by defects of very weak electron-phonon coupling, which are present in crystals either irradiated or containing a slight nonstoichiometric excess of Li. Both Raman and luminescence spectra show in their detailed resolved structure pronounced isotope shifts allowing a classification of the phonon modes involved. Comparison with data from neutron scattering and lattice-dynamics calculations gives very close agreement and identifies the modes as originating essentially from X and L points at the Brillouin-zone edges. Isotope effects on the zero-phonon lines of the defect luminescence are also observed and discussed. (14 refs.)

120089 Infrared spectra at room and at low temperature of single crystals of 3(4-chlorophenyl)2-cyanopropenonitrile. R.Bugueno-Hoffmann, J.Meinnel (Lab. de Phys. Cristalline, CNRS, Rennes, France).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.771-5 (1983).
The oriented single crystals of 3(4-chlorophenyl)2-cyanopropenonitrile, assignments at ambient and liquid nitrogen temperature, are reported for most of the bands, observed from 4000-300 cm^{-1} in the IR spectra. It is interesting to notice that remarkable crystal field effects were pointed out in the spectra. Neither the temperature dependence in the i.r. nor the specific heat between 40-7K and differential thermal analysis between 293 and 120K revealed the existence of a transition. (10 refs.)

120090 Infrared spectral investigation of orthovanadates and CrO_6 groups in $TlM^{II}Cr_2(VO_4)_3$ compounds. M.A.Nabar, D.S.Phanasgaonkar (Dept. of Chem., Univ. of Bombay, Bombay, India).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.777-9 (1983).
The IR spectra of triple orthovanadates $TlM^{II}Cr_2(VO_4)_3$ (where M=Co, Ni, Cu, Mg, Ca, Sr, Ba or P's) have been obtained in the region 4000-200 cm^{-1} and are discussed with the aid of site group analysis. The complexity of the spectra is attributed to the possibility of VO_4^{3-} groups being located on two sites of different symmetries as well as to appearance of vibrational modes corresponding to condensed CrO_6 lattice. (14 refs.)

120091 Studies on polynuclear molybdates in the aqueous solution by laser Raman spectroscopy. K.Murata, S.Ikeda (Dept. of Chem., Osaka Univ., Osaka, Japan).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.787-94 (1983).
Polynuclear molybdates in the aqueous solution were investigated by the use of laser Raman spectroscopy. It was found from Raman measurements and chemical analysis of salts that two species of $Mo_6O_{19}^{2-}$ and $Mo_{12}O_{37}^{2-}$, except for $Mo_7O_{24}^{6-}$ and $Mo_8O_{26}^{4-}$ to be known, exist in the weakly acidic solutions. These species play an important role in the formation of heteropolymolybdate such as 12-molybdophosphate. The intensity in the Raman spectra was normalized by using an internal standard of sodium nitrate. This normalization made it possible to investigate some chemical equilibria of polynuclear species in detail. The formation constant of $Mo_7O_{24}^{6-}$ to be determined from this procedure agrees with that to be previously reported by the use of potentiometry. (29 refs.)

120092 The vibrational spectrum of anisole. W.J.Balfour (Dept. of Chem., Univ. of Victoria, Victoria, BC, Canada).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.795-800 (1983).
The infrared and Raman spectra of $C_6H_5OCD_3$, $C_6D_5OCH_3$ and $C_6D_5OCD_3$ have been recorded in the liquid state. Vibrational assignments have been made and values for most of the fundamental vibrations have been obtained and correlated with those of $C_6H_5OCH_3$. Studies of the ultraviolet absorption spectrum have provided gas-phase data on a number of totally symmetric modes. (11 refs.)

120093 Water overtone and combination bands in the near-infrared spectrum of $M_2FeCl_5.H_2O$ (M=Cs,K) at cryogenic temperatures. P.J.McCarthy (Dept. of Chem., Canisius Coll., Buffalo, NY, USA), I.M.Walker.
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.827-34 (1983).
Polarised crystal spectra of $Cs_2FeCl_5.H_2O$ have been measured at 10K in the range 3900-20000 cm^{-1} (2550-500 nm). The two ligand field spectra (8000-20000 cm^{-1}) agree with those in the literature. Three distinct spectra were obtained in the 3900-7500 cm^{-1} range. The symmetry, intensity and energy of the bands permit their assignment principally as combination and overtone vibrations of the bound water. The plane of the water molecule is calculated to lie about 32° above or below the *bc* plane of the crystal. Limited assignments are offered for the more complex crystal system, $K_2FeCl_5.H_2O$. (15 refs.)

120094 Infrared and Raman spectra of trans-$[MX_2(H_2O)_4]^+$ type complex ions (M=Ti(III), V(III) and Cr(III) and X=Cl and Br). D.Michalska-Fong (Todd Wehr Chem. Building, Marquette Univ., Milwaukee, WI, USA), P.J.McCarthy, K.Nakamoto.
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.835-42 (1983).
The infrared and low-temperature Raman spectra of $Cs_3VCl_6.4H_2O$, $Cs_2CrCl_5.4H_2O$, $Cs_2TiCl_5.4H_2O$, $Cs_2VBr_5.4H_2O$, and related compounds have been measured in the region from 4000 to 200 or 100 cm^{-1}. Normal coordinate calculations have been carried out on the trans-$[MCl_2(H_2O)_4]^+$ structure (M=V(III), Cr(III) and Ti(III)) derived from X-ray analyses of the first two compounds. The presence of the trans-$[MX_2(H_2O)_4]^+$ type (X=Cl and Br) ion in all the compounds studied has been confirmed by the similarity of their vibrational spectra. (16 refs.)

120095 Raman tensor of covalent semiconductors. L.Brey, C.Tejedor (Dept. de Fisica del Estado Solido, Univ. Autonoma, Madrid, Spain).
Solid State Commun. (USA), vol.48, no.4, p.403-6 (Oct. 1983).
The Raman cross section in covalent semiconductors is analysed by means of simple tight-binding models. The required dependence of the model Hamiltonian upon the ionic displacements is estimated from the variation of the electronic susceptibility of a crystal under hydrostatic pressure. The results for the Raman tensor are in satisfactory agreement with both experimental data and previous computations. Some results for the optical deformation potentials are presented as well. (21 refs.)

120096 Structure of vibrational spectra of $Cd_{1-x}Hg_xTe$ solid solutions. S.P.Kozyrev, L.K.Vodop'yanov, R.Triboulet (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.361-4 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.635-41 (March 1983). [received: Oct. 1983]
An investigation was made of the lattice reflection spectra of $Cd_{1-x}Hg_xTe$ ($0 \leq x \leq 0.8$) solid solutions recorded in the spectral range 20-90 μm at $T=85K$. Two separate CdTe-and HgTe-like reststrahlen bands with intensities typical of two-mode systems were investigated. A fine structure was observed for compositions with $x=0.1$-0.6 in the region of the CdTe-like band. These spectral features were explained by a harmonic model postulating the dependences of the frequencies and oscillator strengths of the lattice vibrations of the composition x and allowing for the tendency of formation of clusters from cations of one kind (Cd or Hg) around Te anions. The optical vibrations were calculated allowing only for the elastic interaction between the nearest neighbors in the equations of motion; forces acting over longer distances were allowed simply by introducing an effective field. The reflection spectra calculated on the basis of this model agreed with the experimental results on the assumption that the cluster-formation parameter was sufficiently large ($\beta=0.6$). (12 refs.)

120097 Influence of an external environment on the vibrational spectra of SeO_3^{2-} and SO_3^{2-} impurity anions in KCl and KBr crystals. V.V.Boiko, I.Ya.Kushnirenko, V.I.Vaidanich (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.380-4 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.667-74 (March 1983). [received: Oct. 1983]
An investigation was made of the structure of the infrared absorption spectra of SeO_3^{2-} and SO_3^{2-} anions formed in alkali halide (KCl and KBr) crystals in the course of additional doping with Ca^{2+} and Ba^{2+} cations. A study was made of the influence of the crystal environment and of defects (Me^{2+} cations, vacancies) in the immediate vicinity of anions on their local symmetry. A calculation was made of vibrations of anions of the C_{3v} symmetry in the case when the local symmetry was reduced to C_s. The structure of the spectra was identified, the force constants with the Se-O and S-O bonds were determined, and the changes in these constants as a result of reduction in the local symmetry of the anions were found. (13 refs.)

120098 Lattice reflection spectra of TlS_xSe_{1-x} solid solutions. R.A.Aliev, K.R.Allakhverdiev, R.M.Sardarly, N.Yu.Safarov (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.520-1 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR),* vol.25, no.3, p.904-5 (March 1983). [received: Oct. 1983]
The authors have investigated the long-wavelength infrared reflection spectra of the TlS_xSe_{1-x} solid solution system. They have found the composition dependences of the frequencies of the infrared-active phonons, and established mixed one- and two-mode dependences of the optical phonon frequencies on the composition. (6 refs.)

120099 Raman scattering and symmetry of vibrational modes in SnI_4 crystals. A.V.Bobyr', I.S.Gorban', V.A.Gubanov, G.I.Salivon, T.N.Sushkevich, V.V.Friezel'.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1327-34 (Sept. 1983). In Russian.
Vibrational frequencies of the Raman active modes of SnI_4 crystals were obtained from the polarized Raman spectrum. Group-theoretical analysis of the symmetry of the vibrational modes in the centre of the Brillouin zone was performed. A correlation diagram was constructed to demonstrate the correspondence between the vibrational modes of the crystal and modes of the SnI_4 molecule, the nature and specific features of the low-frequency spectrum have been examined. (5 refs.)

120100 Dynamic intermolecular effects in C_2Br_4 single crystal. G.E.Krasnyanskii, Yu.P.Tsyashchenko, N.E.Ralko.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1343-6 (Sept. 1983). In Russian.
A quantitative evaluation is performed for relative intensities of intramolecular vibration Davydov splitting components ν_9 and ν_{11} in the C_2Br_4 crystal infrared absorption spectrum. The comparison of these with experimental ones shows that the use of the dipole-dipole interaction potential makes it possible to give a complete quantitative description of dynamic intermolecular effects in the C_2Br_4 crystal. (6 refs.)

78.35 BRILLOUIN AND RAYLEIGH SCATTERING

120102 Theory of inelastic light scattering processes in $(CH)_x$. E.J.Mele (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.267-72 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Outlines an analysis of the Stokes lineshape dispersion in trans$(CH)_x$ which attributes the effect to the excitation energy dependence of the relaxation pathway for the polymer following photoexcitation rather than to Raman scattering in short trans segments. (16 refs.)

120103 Dynamical light scattering. W.Przygocki (Inst. Wlokien Sztucznych, Politech. Lodzka, Lodz, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.1, p.1-3 (Jan. 1983). In Polish. [received: Oct. 1983]
The physical principles of the method of dynamical light scattering are discussed. The applications of this method to the measurement of the diffusion coefficient of macromolecules and to studies on the dynamical properties of polymers are considered. (22 refs.)

120104 The effect of a small amount of difficult-soluted impurity on light scattering by aqueous solutions of nonelectrolytes. E.P.Kulikova, M.F.Vuks, L.V.Shurupova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.91-4 (Aug. 1983). In Russian.
The effect of a small amount of difficulty-soluble impurity (anthracene) on the intensity of light scattering in aqueous solutions of *t*-butanol, acetonitrile and dioxan has been studied. A small amount of anthracene increases the intensity of light scattering due to the desorption of anthracene microcrystals on the border of two coexisting microphases with different structure in that region of concentrations where the cooperative change of the solution structure takes place. (12 refs.)

120105 Light scattering from a Na_2O-SiO_2 glass with metastable phase separation. W.Rohmann (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.107-12 (1983). In English.
Using a particle model for diffusion-controlled growth in a metastable immiscible system proposed by Frank (1950) and Zener (1949) the parameters of scattering particles have been determined by one and two parameter fitting of the scattering curves to experimental data for a Na_2O-SiO_2 glass. It is concluded that two-parameter-fitting is a suitable method to determine particle radii and the parameter characterizing the refraction index profile. (5 refs.)

78.40 VISIBLE AND ULTRAVIOLET SPECTRA

120106 Solvatochromic behaviour of ferrodiin and ferroin. C.C.Deb, D.K.Hazra (Dept. of Chem., Univ. of North Bengal, Darjeeling, India), S.C.Lahiri.
Indian J. Chem. A, vol.22A, no.3, p.234-6 (March 1983). [received: Oct. 1983]
The solvent dependence of the spectral behaviour of ferrodiin and ferroin has been examined in various solvents. The results indicate a slight solvent dependence of the charge-transfer band (ν_{max}) of $Fe(LL)_3{}^{2+}$, but it is not as pronounced as in the case of $Fe(LL)_2(CN)_2$(L-L=diamine). The behaviour of hydrogen bonding solvents is different from that of dipolar aprotic solvents. (15 refs.)

120107 Poly(2,2′-bithiophene): an electrochromic conducting polymer. M.A.Druy, R.J.Seymour (Fundamental Res. Lab., GTE Labs. Inc., Waltham, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.595-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors present the optical properties of poly (2,2′ bithiophene) and show that this material exhibits electrochromic behavior. (11 refs.)

120108 Doping of polyparaphenylene—a spectroscopic study of thin transparent films. B.Tieke, Ch.Bubeck, G.Lieser (Inst. fur Makromolekulare Chemie, Univ. Freiburg, Freiburg, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.753-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
p- and n-type doping of poly-1,4-phenylene as well as the reaction of the doped polymer with moisture were studied by absorption spectroscopy, using thin transparent films of the polymer. (13 refs.)

120109 Theoretical interpretation of the vacuum ultraviolet reflectance of liquid helium and of the absorption spectra of helium microbubbles in aluminium. A.A.Lucas, J.P.Vigneron, S.E.Donnelly (Inst. for Res. in Interface Sci., Facultes Univ. Notre-Dame, Namur, Belgium), J.C.Rife.
Phys. Rev. B (USA), vol.28, no.5, p.2485-96 (1 Sept. 1983).
The position and width of the helium resonance line $1^1S_0 \rightarrow 2^1P_1$ are calculated for a high-density helium fluid. The theory aims at understanding the reflectivity data of Surko et al. for the low-temperature liquid-vapour interface and the absorption data of Rife et al. for room-temperature, high-pressure helium bubbles in aluminium. The theoretical ingredients of the model are (i) the long-range dipole interaction of an excited 2*P* atom with the rest of the fluid and with the metal substrate; (ii) the short-range Pauli pseudorepulsion arising from othogonalisation of the 2*p*-electron wave function with the 1*s* ground-state orbital of neighbouring atoms; (iii) a statistical treatment of the high-density fluid based either on the experimentally measured radial pair distribution function of low-*T* liquid He, or on the Percus-Yevick distribution function of hard spheres and the theoretical equation of state of Young et al. for the He fluid in the bubbles; (iv) the standard static line-broadening theory to calculate the effect of Pauli repulsion on the line shapes. The theory provides a reasonably accurate understanding of the observed spectra in both the liquid and high-density gas, and can serve as a sound basis for interpretation of vacuum ultraviolet spectra in other gas-metal combinations. (37 refs.)

120110 The origin of anomalous temperature dependences of intensities of spin-forbidden d-d transitions in octahedral complexes. A.v.MalakhoVskii, G.G.Vasiljev (L.V. Kirensky Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Solid State Commun. (USA), vol.48, no.4, p.353-6 (Oct. 1983).
It is shown that anomalous temperature dependences of intensities of spin-forbidden d-d transitions, observed in octahedral magnetically-ordering complexes in a paramagnetic phase and in particular in hexagonal $RbMnCl_3$, investigated by the authors, can be accounted for by a pair-vibrational mechanism, which represents two simultaneous events: breaking of selection rules for spin during pair absorption by exchange coupled ions and breaking of those for parity during an ordinary electronic transition in one of the ions of the pair due to excitation of odd-parity vibrations. (12 refs.)

120111 Reflection spectra of $LiTaO_3$ in the fundamental absorption region. A.M.Mamedov (S.M. Kirov State Univ., Baku, Azerbaidzhan SSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.514-15 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.894-6 (March 1983). [received: Oct. 1983]
The author has used the method of vacuum ultraviolet spectroscopy to study the electron spectra of single crystals of lithium tantalate $LiTaO_3$, which is a member of a large family of oxygen-octahedral crystals. The measurements were carried out to determine the role of the TaO_6 octahedra in the electron band structure of lithium tantalate and to obtain information on the spectra

of high-energy excitations, which is still lacking in spite of extensive experimental and theoretical investigations of the electron structure of oxygen-octahedral ferroelectrics. (8 refs.)

78.45 STIMULATED EMISSION

(see also 42.65C in nonlinear optics)

120112 Stimulated emissions from Er^{3+} ions at 1.7 μm in self-activated oxygen-containing Er crystals. A.A.Kaminskii, A.G.Petrosyan (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1645-7 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1910-11 (Nov. 1982).
The effect of SE generation by Er^{3+} ions at ~110K on the waves of the additional channel $^4S_{3/2} \to {}^4I_{9/2}$ (range ~1.7 μm) high-Er^{3+} crystals with a garnet (space group $O_h{}^{10}-Ia3d$) and perovskite ($D_{2h}{}^{16}-Pbnm$) structure whose initial state ($S_{3/2}$) is also submitted to strong concentration quenching due to cross relaxation was studied. This study is based on the results of a study of the real intensity of spectral transitions of Er^{3+} ions in fluorine and oxygen-containing crystals. (15 refs.)

120113 Gain saturation in photoexcited semiconductors. A.Ron (Dept. of Chem. & Solid State Inst., Technion, Haifa, Israel), A.Ron, E.Cohen.
Phys. Rev. B (USA), vol.28, no.6, p.3324-9 (15 Sept. 1983).
A model is presented which provides a satisfactory explanation of the spectral shape of the stimulated emission in highly photoexcited (direct-gap) semiconductors at low temperatures. The model assumes the existence of an electron-hole plasma which fills a fraction of the excited volume depending on the excitation intensity. The processes in the plasma are electron and hole generation by the external excitation, recombination by stimulated emission, and particle relaxation within the plasma by collisions. The last one is described by a cross section which depends on the particle-energy separation from the Fermi surface. The coupled rate equations for the electrons (holes) and the radiation field are solved under steady-state conditions. The calculated stimulated-emission spectra show a red shift as a function of a parameter which is proportional to the product of the excitation intensity and stripe length. The result explains well the red shift and saturation of stimulated-emission spectra observed in GaAs by Shaklee et al. (1973). (18 refs.)

78.50 IMPURITY AND DEFECT ABSORPTION IN SOLIDS

120114 Determination of the nitrogen doping of liquid phase epitaxy GaP and $Ga_xIn_{1-x}P$ alloys by optical absorption and photoluminescence. V.Thierry-Mieg, A.Marbeuf, J.Chevallier, H.Mariette (Lab. de Phys. des Solides, CNRS. Meudon-Bellevue, France), M.Bugajski, K.Kazmierski.
J. Appl. Phys. (USA), vol.54, no.9, p.5358-62 (Sept. 1983).
Optical absorption and photoluminescence have been used to determine the nitrogen concentration in liquid phase epitaxy GaP and $Ga_xIn_{1-x}P$ layers. Both methods give the same variation of nitrogen concentration. The same nitrogen maximum concentration of $[N]=8\times10^{17}$ cm^{-3} has been found in GaP and in $Ga_{0.998}In_{0.002}P$ grown at 900°C and $P_{NH3}>10^{-3}$ atm. In $Ga_xIn_{1-x}P$, it has been shown that the nitrogen concentration incorporated in the layer decreases as the indium amount increases, for indium concentrations less than 5%, in samples prepared with identical growth conditions. (21 refs.)

120115 Induced absorption and metastable states in ZnS:Mn and ZnS. J.M.Noras (Dept. of Phys., Univ. of Bradford, Bradford, England).
J. Phys. C (GB), vol.16, no.28, p.5517-21 (10 Oct. 1983).
The absorption and excitation spectra of a strong photoinduced band found in samples of ZnS:Mn at 6 and 77K are reported. The process involves first the population of a metastable level and subsequently excitation to a higher level, which shows the induced absorption. The centre responsible is not identified. (2 refs.)

120116 Boron impurity anti-site defects in p-type gallium-rich gallium arsenide. J.Woodhead, R.C.Newman, I.Grant, D.Rumsby, R.M.Ware (J.J. Thomson Phys. Lab., Univ. of Reading, Reading, England).
J. Phys. C (GB), vol.16, no.28, p.5523-33 (10 Oct. 1983).
It is shown that gallium arsenide crystals grown from gallium-rich melts encapsulated in boric oxide contain boron impurities, some fraction of which occupy arsenic lattice sites. In compensated material these acceptor defects are in negative charge state and give rise to infrared absorption due to localised vibrational modes (LVM) at 601 cm^{-1} ($^{11}B_{As}$) and 628 cm ^{1}($^{10}B_{As}$). The authors demonstrate for the first time that in p-type material neutral B_{As} defects are present although they give no detectable LVM absorption: their presence is revealed by tuning the position of the Fermi level, E_F, to the point where it coincides with the acceptor electronic level. This is achieved by introducing deep-hole traps by electron irradiation and then fine tuning of E_F is effected by varying the temperature of the sample. They estimate the B_{As} acceptor level to be somewhat greater than 0.2 eV above the valence band and there is a possibility that it is the previously reported level at 0.23 eV. The level at 0.077 eV is probably due to an intrinsic defect. (34 refs.)

120117 Role of molecular anions in the formation of complex centers in cesium iodide detectors. L.P.Smol'skaya, T.A.Kolesnikova.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.129-32 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.150-4 (Jan. 1983).
It may be assumed that one of the reasons for the detrimental effect on the scintillation properties of detectors in the presence of oxygen-containing impurities is the formation of complexes containing activator ions and the oxygen-containing impurity ions. In the present work the authors have attempted to observe such complexes using IR spectroscopy and studied their distribution in the crystal. (16 refs.)

78.55 PHOTOLUMINESCENCE

120118 Time-resolved total internal reflection fluorescence spectroscopy of polymer films. H.Masuhara, N.Mataga (Dept. of Chem., Osaka Univ., Toyonaka, Japan), S.Tazuke, T.Murao, I.Yamazaki.
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.415-19 (23 Sept. 1983).
Using total internal reflection, the possibility of a subnanosecond fluorescence spectroscopy for elucidating photophysical and photochemical processes of polymer surface is demonstrated. The thickness which can be studied under the present experimental conditions is of the order of 0.01 μm. (9 refs.)

120119 Theory of coherence effects in time-dependent delayed fluorescence. II. Application to two- and three-dimensional crystals. A.Fort, V.Ern, V.M.Kenkre (Lab. de Spectroscopie et d'Optique du Corps Solide, Univ. Louis Pasteur, Strasbourg, France).
Chem. Phys. (Netherlands), vol.80, no.3, p.205-11 (15 Oct. 1983).
A recently developed theory of the effects of transport coherence of triplet excitons on the time dependence of delayed fluorescence in molecular crystals is applied to two- and three-dimensional crystals. Manifestations of anisotropy are studied for arbitrary coherence and it is shown that the mean-square-velocity tensor can be extracted explicitly in the coherent limit. (7 refs.)

120120 Singlet exciton migration in a random organic two-component system containing physical and chemical traps. G.Peter, B.Ries, H.Bassler (Fachbereich Phys. Chem., Philipps-Univ., Marburg, Germany).
Chem. Phys. (Netherlands), vol.80, no.3, p.289-97 (15 Oct. 1983).
Steady-state as well as time-dependent fluorescence studies have been carried out near 80K on glassy mixed layers of anthracene and phenanthrene doped with tetracene and containing incipient anthracene dimers, as physical traps. The efficiency of energy transfer from initially excited anthracene ('donor') sites to tetracene ('supertrap') has been measured as a function of donor concentration c_D. The results are interpreted in terms of a superposition of two transfer pathways: (i) Random walk of excitations across the donor ensemble to either tetracene or anthracene dimers and (ii) single step Forster transfer from the excited dimers (excimers) to tetracene. The efficiency of process (i) is in quantitive accord with the predictions of the 2D version of the Loring, Anderson and Feyer theory assuming diple-dipole coupling. (39 refs.)

120121 Fluorescence and its Nd^{3+} concentration dependence of Nd-doped SiO_2 glasses prepared by plasma torch CVD. K.Arai, H.Namikawa, K.Kumata, Y.Ishii, H.Tanaka, I.Iida (Electrotech. Lab., Ibaraki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L397-9 (July 1983).
The time resolved fluorescence spectra and their Nd^{3+} concentration C_{Nd} dependence were observed in Nd-doped SiO_2 glasses prepared by plasma torch CVD. The $^4F_{3/2}$ radiative emissions observed consist of a fast (FDC, $\tau_m \simeq 0.35\ \mu s$) and a slow (SDC, $\tau_m \simeq 470\ \mu s$) decay component. The FDC are characterized by the intensity ratio ($^4F_{3/2}$-$^4I_{11/2}$/$^4F_{3/2}$-$^4I_{9/2}>1$), but the SDC by the inverse ratio and the spectral shifts to the longer wavelength. The SDC increases and reaches almost constant values in higher C_{Nd}. The FDC cannot be observed in very low C_{Nd} region, but increases abruptly in higher C_{Nd}. The FDC is ascribed to the Nd^{3+} in the clustering microstructure and the SDC is ascribed to the isolated Nd^{3+} in crystal field unique to unitary SiO_2 glass. (5 refs.)

120122 Study of two different deep levels in undoped LEC SI-GaAs by photoluminescence spectroscopy. T.Kikuta, K.Ishida (Optoelectronics Joint Res. Lab., Kawasaki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L409-11 (July 1983).
Undoped LEC SI-GaAs crystals can be classified into two groups with respect to the deep PL emission band. One group dominantly exhibits emission peak energy at 0.8 eV, and the other at 0.65 eV. The profile along the growth direction and the wafer diameter for resistivity was similar to that for the 0.8 eV PL peak intensity in the 0.8 eV dominant crystals, while it was opposite to that for the 0.65 eV PL peak intensity in the 0.65 eV dominant crystals. The presence of these emission bands was found to depend on the growth conditions. Results suggest that two deep levels related to different origins are present in undoped LEC SI-GaAs. (13 refs.)

120123 Bound-exciton luminescence of Cu-doped ZnSe. S.-M.Huang (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan), Y.Nozue, K.Igaki.
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L420-2 (July 1983).
As an experimental approach to clarify the correlation between doped impurity and native defects, copper was doped at a low temperature to high-purity ZnSe crystals with controlled deviation from stoichiometry by a previous heat treatment under molten Zn or saturation pressure of Se. Photoluminescence was measured and examined as a function of deviation from stoichiometry. The site selection doping of Cu was achieved by controlling native defect concentrations. I_1^{deep} lines are known to arise from acceptors of two different origins, V_{Zn} and Cu_{Zn}. (10 refs.)

120124 Photoluminescence and lattice mismatch in InGaAs/InP. T.Yagi, Y.Fujiwara, T.Nishino, Y.Hamakawa (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L467-9 (July 1983).
A new photoluminescence (PL) band in LPE InGaAs layers nearly lattice-matched to InP has been observed at 0.69 eV at 77K. This PL band has a strong correlation with the degree of the lattice mismatch between InGaAs and InP, and the intensity shows the minimum at the lattice mismatch of $-0.08\sim-0.07\%$. The in-depth profile of the PL intensity has been also measured, the result showing that the intensity slightly increases in the interface region of InGaAs and InP, though the PL intensity of the InGaAs edge emission is nearly constant in the InGaAs layer. These results are well explained by considering the difference of the lattice parameters of InGaAs and InP at both the LPE growth and room temperature, and might suggest the existence of some defects introduced during the epitaxial growth by the lattice mismatch between InGaAs and InP. (8 refs.)

120125 Deep-level luminescence in Ni-diffused GaAs. Y.Fujiwara, A.Kojima, T.Nishino, Y.Hamakawa (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L476-8 (July 1983).
The deep-level photoluminescence associated with the Ni deep acceptor has been investigated in various kinds of Ni-diffused GaAs. It has been found that the luminescence related to the Ni deep acceptor drastically changes from the surface to the deep region of Ni-diffused GaAs. In particular, the luminescence previously attributed to Ni-S pairs is strongly observed near the surface of all the GaAs samples doped with a variety of donor impurities. The in-depth profile measurements on these Ni-related luminescence intensities have revealed the builtup of S atoms in the vicinity of the surface region of Ni-diffused GaAs, which is probably due to the redistribution of the background S donors in GaAs bulk crystals during the high-temperature diffusion of Ni into GaAs. (10 refs.)

120126 Synthesis and luminescent properties of solid solutions $Tb_xCe_{1-x}BO_3$. B.F.Dzhurinskii, L.Z.Gokhman, A.V.Osiko, L.N.Zorina, N.N.Soshchin (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1494-7 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1739-43 (Oct. 1982). [received: Sept. 1983]
Solid solutions were synthesized in the system $CeBO_3$-$TbBO_3$. The luminescence spectra of Tb^{3+} in the matrix $CeBO_3$ were identified at 77 and 300K. It was shown that all lines in the visible part of the spectrum arise due to $^5D_4 \rightarrow {}^7F_J$ transitions. The most intense group of lines corresponds to the transitions $^5D_4 \rightarrow {}^7F_5$ in the region 5420 Å. The solid solution $Tb_{0.05}Ce_{0.95}BO_3$ with the highest concentration of terbium has the highest luminescence intensity. (8 refs.)

120127 Low temperature photoluminescence of *n*-type GaInAsP layers grown on InP by liquid phase epitaxy. B.Beaumont, G.Nataf, J.C.Guillaume, C.Verie (Lab. de Phys. du Solide et Energie Solaire, CNRS, Valbonne, France).
J. Appl. Phys. (USA), vol.54, no.9, p.5363-8 (Sept. 1983).
Layers of the quaternary alloy $Ga_xIn_{1-x}As_yP_{1-y}$ ($x\sim0.1$, $y\sim0.3$) were grown on InP(100) substrates by super-cooling liquid phase epitaxy. Tellurium was used for *n*-type doping in the range $8\times10^{17}-5\times10^{19}$ cm^{-3}. A good homogeneity of the composition of the layers was obtained at the surface. No microprecipitates of tellurium were detected by a scanning electron microscope. Systematic studies of luminescence at low temperature were used to characterize the samples, with a particular attention focused on the degeneracy of the conduction band. Calculations of the line shapes were performed based on a recombination mechanism involving acceptor-like states of the valence band and conduction band filling effects. Good agreement was obtained between calculated and experimental line shapes. The Fermi level in quaternary alloys is found to be lower than predicted by theoretical calculations using band structure properties developed in the past for definite III-V compounds such as GaAs and InP. It is suggested that this could be related with disorder electronic effects. (30 refs.)

120128 X-ray induced luminescence in crystalline SiO_2. P.J.Alonso, L.E.Halliburton, E.E.Kohnke, R.B.Bossoli (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5369-75 (Sept. 1983).
The X-ray induced 'blue' emission from commercially available, high-quality synthetic quartz has been studied between 80 and 300K. Three overlapping bands, each having a different quenching temperature, have been experimentally resolved in the as-grown crystals. These bands peak at 440, 425, and 380 nm; their half-widths are 0.64, 0.75, and 0.92 eV; and they thermally quench in the 120-160, 170-210, and 220-270K regions, respectively. An intense electron irradiation at room temperature or an electrodiffusion (sweep) in a hydrogen atmosphere eliminates the band at 380 nm. The results suggest that the 380-nm band arises from recombination of an electron with a hole trapped adjacent to an alkali-compensated aluminum ion (i.e., an Al-M^+ center). The origins of the bands at 440 and 425 nm remain unknown. As an application of these results, a screening test is described which could assist quality control during selection of quartz bars for use in precision frequency control devices. (16 refs.)

120129 Amorphous properties of excimer luminescence in poly(*N*-vinylcarbazole) films. Y.Nozue, T.Hisamune, T.Goto (Dept. of Phys., Tohoku Univ., Sendai, Japan), H.Tsuruta.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2983-5 (Sept. 1983).
The emission properties of poly(*N*-vinylcarbazole) films have been investigated by monochromatic light excitation at 4.2K. The luminescence of the weakly bound excimer (the second excimer) shows the shift of the peak energy with varying excitation energy. This phenomenon is interpreted as due to the amorphous properties of the carbazole chromophores of the polymer. It is elucidated that the excimer is the localized exciton relaxed by the intercarbazole interaction at the excimer-forming site. (5 refs.)

120130 Relaxation of the 2s hot excitons in alkali iodides. H.Nishimura (Dept. of Appl. Phys., Osaka City Univ., Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3233-43 (Sept. 1983).
In the 2s exciton absorption region, remarkable oscillation structures with the energy interval of the LO phonon have been observed in the luminescence excitation spectra. The oscillation structures for 1s free exciton luminescence, E_x luminescence and impurity luminescence are in phase with one another, and the structures for σ luminescence and π luminescence are also in phase with each other. The structure of the former group is, however, out of phase with the structure for the latter group. These two series of the oscillation structures are discussed by introducing several relaxation processes of 2s hot excitons, such as cascade relaxation, self-trapping and interband scattering, and the rates of the processes are estimated. (12 refs.)

120131 Relaxation processes of free excitons in KBr:Na. K.Toyoda, K.Nakamura, Y.Nakai (Dept. of Phys., Osaka Dental Univ., Hirakata, Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3254-9 (Sept. 1983).
Excitation spectra of luminescence due to Na ions in KBr:Na crystals have been investigated in detail at LHeT by varying the Na content. Quantum efficiency of the luminescence shows a characteristic change according to whether the exciting energy is above or below the peak energy of the first exciton band (E_h- or E_l-excitation). Two different processes are suggested for the relaxation of the free exciton. Excitons created by E_l-excitation have much longer lifetime than those created by E_h-exciton. The diffusion length of the exciton produced under E_l-excitation is estimated to be nearly 17 lattice distances (110 A), while the diffusion length of the exciton produced under E_h-excitation is very small. (13 refs.)

120132 Excitation and decay of H4 luminescence in diamond. A.T.Collins (Wheatstone Lab., King's Coll., London, England), M.F.Thomaz, M.I.B.Jorge.
J. Phys. C (GB), vol.16, no.28, p.5417-25 (10 Oct. 1983).
Photoluminescence and cathodoluminescence decay time measurements have been carried out for the H4 (2.499 eV) centre in diamond. The photoluminescence decay time increases progressively from $\simeq$ 19 to 23 ns as the energy of the exciting light is increased from 2.6 to 4.0 eV, and the cathodoluminescence decay curves are non-exponential. Luminescence excitation measurements reveal a previously unreported absorption band peaking at about 3.2 eV in the ultraviolet spectral region; absorption of light in this band produces H4 luminescence. The range of decay times noted above is believed to be due, at least in part, to transitions from the higher excited levels via the 2.499 eV excited state. The decay time of 19 ± 1 ns measured with photoexcitation at 2.6 eV shows no significant variation with temperature, and this represents the most likely value of the radiative lifetime of the 2.499 eV centre. (14 refs.)

120133 Investigation of laser-induced luminescence and polarisation change in ferroelectric $AgNa(NO_2)_2$ in the time domain. H.Happ, C.Thoma (II. Phys. Inst., Univ. zu Koln, Germany).
J. Phys. C (GB), vol.16, no.28, p.5535-42 (10 Oct. 1983).
The luminescence in ferroelectric $AgNa(NO_2)_2$ induced by excitation of the lowest triplet state of the NO_2^- ions is measured in the time domain for temperatures between 3.1 and 330K including the region of the ferroelectric phase transition. From 50 to 330K the intensity decays exponentially and the time constant follows a $1/T$ law up to 280K. Between 10 and 40K the decay curve is complex. The ferroelectric phase transition at 312K is clearly exhibited in the temperature dependence of the initial intensity of luminescence and the time constant. In addition, the response of the spontaneous polarisation induced by transfer of excitation energy to the lattice is measured in the time domain. The time constant of the response shows critical slowing down at T_c. (12 refs.)

120134 Influence of the crystal structure on the luminescence properties of rare earths. G.Le Flem, C.Parent, C.Fouassier (Univ. de Bordeaux, CNRS, Talence, France).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.383-8 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The influence of the crystal structure on the luminescence properties of rare earths can be reviewed by starting from two complementary points of view. (i) The use of rare earth ions such as Nd^3, Eu^{3+} and Gd^{3+} as local structural probes allows precise investigations of crystal structures to be performed. Recent results concerning the appearance of multisites in complex systems such as stabilized zirconia or sodium rare earth orthophosphates are discussed. (ii) Typical luminescence properties can be deduced directly from the crystal structure. Clear correlations have been established for families of materials with specific applications, e.g. low self-concentration quenching in neodymium microlasers, requirements for a 4f-4f Eu^{2+} emission and efficiency of Ce^{3+}-Tb^{3+} transfer. (13 refs.)

120135 Luminescence of high pressure phases of Eu^{2+}-activated alkaline earth borates and silicates. G.Y.Adachi, K.-I.Machida, J.Shiokawa (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.389-98 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
High pressure phases of EuB_2O_4, MB_2O_4-Eu^{2+} ($M \equiv Ca,Sr$), $EuSiO_3$ and $MSiO_3$-Eu^{2+} were synthesized at pressures of 30-150 kbar. The pressure-temperature phase diagram of EuB_2O_4 consists of the following four regions: phases I, III and IV, and a region of phase separation into EuB_4O_7 and $Eu_2B_2O_5$. The band emissions of the high pressure of EuB_2O_4 and SrB_2O_4-Eu^{2+} are assigned to $(4f)^7$-$(4f)^6(5d)$ transitions of the Eu^{2+} is about 100 times higher than that of phase I of the corresponding borate. This is firstly due to the fact that the Eu^{2+} ions in phase IV are effectively surrounded by BO_4 tetrahedra of the three-dimensional B_3O_6 network such that their interaction with neighbouring Eu^{2+} ions is restricted. Secondly, the phase transformation appears to reduce the lattice vibration of the borate network, thus decreasing non-radiative processes. The application of pressures of up to 150 kbar on $EuSiO_3$ resulted in the formation of the new high pressure phases δ and δ'. The emission intensities of $CaSiO_3$-Eu^{2+} and $SrSiO_3$-Eu^{2+} also increased appreciably (by a factor of 20-40) when the host lattices transformed into δ-$CaSiO_3$ and δ'-$SrSiO_3$. (28 refs.)

120136 Spectral properties of liquid polar solutions under conditions of dynamic inhomogeneous orientational broadening. A.N.Rubinov, V.I.Tomin.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.33-50 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.42-61 (Jan. 1983). (27 refs.)

120137 Form of the fluctuation distribution function of fluorescent molecules over electron transition frequencies. E.S.Voropai, V.A.Saechnikov, A.M.Sarzhevskii.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.118-23 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.138-44 (Jan. 1983).
An attempt is made to determine criteria which permit drawing some conclusions about the form of the distribution function of molecules in a rigid solution with respect to the 0-0 transition frequency on the results of spectra measurements. (21 refs.)

120138 Transient photoluminescence in cis-polyacetylene. G.Fasol (Max-Planck-Inst. fur Festkorperforschung, Stuttgart-Busnau, Germany), R.H.Friend.
J. Phys. Colloq. (France), vol.44, no.C-3, p.341-3 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have observed photoluminescence from cis-polyacetylene prepared by the Luttinger route. They report a similar spectrum to that previously observed for Shirakawa material, with a broad photoluminescence band centred at 1.9 eV with superimposed structure attributed to resonance Raman scattering. The lifetime of the luminescence is less than the measurement system response time of 5 ns. (10 refs.)

120139 Anisotropic ligand polarization contributions to the Laporte-forbidden transition probabilities of open-shell metal complexes. B.Stewart (Dept. of Chem., Univ. of Glasgow, Glasgow, Scotland).
Mol. Phys. (GB), vol.50, no.1, p.161-71 (Sept. 1983).
The inclusion of ligand polarizability components making up the symmetric anisotropy tensor $\alpha^{(2)}$ in the ligand polarization analysis of the d-d or f-f transition probabilities of open-shell metal coordination compounds is found to account for the known cases where the corresponding mean polarizability approximation fails. For a given point group symmetry of the metal complex, the addition of the ligand polarizability anisotropy to the dynamic coupling treatment generates the number of intensity parameters required group theoretically for a given multipole transition of the metal ion. (33 refs.)

120140 Direct luminescence evidence for the degenerate electron-hole plasma formation in $A^{II}B^{VI}$ semiconductors. M.S.Brodin, V.M.Bandura, M.G.Matsko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi b (Germany), vol.119, no.1, p.83-7 (1 Sept. 1983).
The emission spectra of ZnTe and ZnSe crystals are investigated at $T=4.2K$ at high excitation densities by a Coumarin 30 and 120 dye laser. It is shown that for excitation densities $R_{exc}>0.1$ MW/cm^2 the emission spectrum of ZnTe exhibits the P-band due to inelastic exciton-exciton scattering. For $R_{exc}>6$ MW/cm^2 the emission of a degenerate electron-hole plasma (EHP) is observed. These emission bands may be differentiated by scanning the exciting quanta energy in the short-wavelength tail region. (11 refs.)

120141 Photoluminescence decay in amorphous silicon alloys. B.Rauscher (Forschungslab. Siemens AG, Munchen, Germany), B.Bullemer.
Phys. Status Solidi a (Germany), vol.79, no.1, p.161-6 (Sept. 1983).
The photoluminescence (PL) decay of undoped a-Si:H, a-Si:O, H, and a-Si:C, H alloys during the first microsecond after excitation is investigated. In all alloys the fastest decay is observed for the short-wavelength PL photons, this is attributed to charge carriers trapped in shallow localized states tunneling to deeper states. This tunneling process competes with the radiative recombination. The nonradiative recombination at nonzero temperatures is interpreted as a thermal activation of the trapped charge carriers to the mobility edges followed by diffusion to nonradiative recombination centres. Whereas the initial decay is thereby accelerated, the radiative decay time in the long-term decay is observed to be prolonged if the temperature rises from 30 to 75K. (13 refs.)

120142 Dependence of photoluminescence on temperature in dislocated silicon crystals. M.Suezawa, Y.Sasaki, K.Sumino (Res. Inst. for Iron, Steel, & Other Metals, Tohoku Univ., Sendai, Japan).
Phys. Status Solidi a (Germany), vol.79, no.1, p.173-81 (Sept. 1983).
The intensities of photoluminescence lines D1 through D4 and also of the background component that are characteristic in a dislocated silicon crystal are measured as a function of the temperature. All of them become weaker as the temperature is raised. Such behaviour is interpreted in a quantitive way with the model in which two different kinds of traps, one with a shallow level and the other with a deep level, participate in the radiative recombination process giving rise to each photoluminescence line. The shallower levels are designed to the levels associated with hole traps that are drawn from the valence band by the deformation potential of a dislocation, and are in the range 4 to 12 meV above the top of the valence band. The deeper levels are proposed to be associated with electron traps due to the antibonding states of reconstructed bonds at the dislocation core, being located in the range 0.16 to 0.35 eV below the bottom of the conduction band. (17 refs.)

120143 The effect of low oxygen concentrations on the photoluminescence of vitreous selenium. B.T.Kolomiets, T.N.Mamontova, A.V.Chernyshov (A.F. Ioffe Phys. Tech. Inst., Acad. of Sci., Leningrad, USSR), G.Z.Vinogradova, N.V.Demokritova.
Phys. Status Solidi a (Germany), vol.79, no.1, p.K89-92 (Sept. 1983).
Considering that the disagreement between previous data and their interpretation could be due to differences in the concentration of impurities present, in particular of oxygen, the authors have undertaken a study of photoluminescence (PL) in g-Se samples containing an exactly known amount of oxygen. The oxygen content in selenium was determined from the variation of the SeO_2 absorption band intensity at 930 cm^{-1}. (6 refs.)

120144 Energy transfer and luminescence in $RbMn_xMg_{1-x}F_3$. J.Danko, D.Pacheco, B.DiBartolo (Dept. of Phys., Boston Coll., Chestnut Hill, MA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2382-8 (1 Sept. 1983).
An investigation, directed toward an understanding of the concentration-dependent characteristics of Mn-Mn energy transfer has been carried out in $RbMn_xMg_{1-x}F_3$ via a detailed luminescence study from 4 to 120K. The emission of $RbMn_xMg_{1-x}F_3$ down to a 40 at.% Mn^{2+} concentration consists of two distinct Mn^{2+} bands which are featureless except in the case of the stoichiometric system. The bands are attributed to two localised traps positioned below the lowest excited level of Mn^{2+}. The variation of the spectra and of the decay patterns with temperature indicate a 'boil-off' mode of decay for the shallower trap and nonradiative decay to the ground state for the deeper trap. The details of the kinetics have allowed the authors to calculate the rate of energy transfer to the shallower luminescence trap for the various samples. It can be concluded that an efficient non-diffusion-limited transfer of excitation exists in $RbMn_xMg_{1-x}F_3$ down to at least 40 at.% Mn^{2+} concentration. Indirect trap-to-trap transfer, present in $RbMnF_3$, is not probable in the nonstoichiometric samples due to the increased presence of quenching sites. (15 refs.)

120145 The lifetime of the fluorescent excited state of liquid cyclohexane. L.H.Luthjens, M.P.De Haas, H.C.De Leng, A.Hummel (Interuniv. Reactor Inst., Delft, Netherlands), G.Beck.
Radiat. Phys. & Chem. (GB), vol.19, no.2, p.121-3 (1982). [received: Oct. 1983]
The average lifetime of the fluorescence of liquid cyclohexane was determined by means of pulse radiolysis with a time resolution of *ca.* 100 ps and found to be 0.95 ns. (12 refs.)

120146 Magnon fluorescence of Eu-chalcogenides stimulated by intense laser radiation. O.A.C.Nunes (Dept. de Fisica, Univ. de Brasilia, Brasilia, Brazil).
Solid State Commun. (USA), vol.48, no.2, p.159-63 (Oct. 1983).
The excitation of magnons induced by intense laser radiation in the electron subsystem of Eu-chalcogenides (magnon fluorescence) is considered. The kinetic equation for the magnon population is obtained from which the magnon excitation rate is calculated. It is found that under certain conditions the excitation rate may become greater than the magnon relaxation rate and the magnon system may reach instability. (15 refs.)

120147 Luminescence and magnetic resonance in post-hydrogenated microcrystalline silicon. F.Boulitrop, A.Chenevas-Paule (CENG, Grenoble, France), D.J.Dunstan.
Solid State Commun. (USA), vol.48, no.2, p.181-4 (Oct. 1983).
The authors report photoluminescence, EPR and ODMR studies of plasma hydrogenated LPCVD microcrystalline silicon thin films. Apart from the dangling bond EPR resonance which is similar to that observed in *a*-Si:H, and possibly the emission at 1.3 eV, they find emission bands and resonance signals quite unlike those observed in normal *c*-Si and *a*-Si:H. They conclude that *μc*-Si:H cannot be regarded purely as crystallites of pure silicon embedded in a matrix of *a*-Si:H. (11 refs.)

120148 The complexes of platinum, their optical properties and their changes in optical glasses. S.Gebala (Inst. Fizyki Politech. Wroclawskiej, Wroclaw, Poland), J.Sarzynski.
Szklo & Ceram. (Poland), vol.34, no.1, p.10-12 (Jan.-Feb. 1983). In Polish. [received: Oct. 1983]
The light transmission and luminescence is compared in the glasses which were melted in ceramic crucibles and in those remelted in the platinum crucibles. In the latter group of glasses the red and yellow luminescence is ascribed to the Pt^{2+} and Pt^{4+} complexes, the excitation spectrum and the absorption bands of which are in the range of 300 to 500 nm. Also the occurrence of Pt^0 has been observed in the absorption bands. The thermal treatment may, apparently, cause the reduction $Pt^{4+} \rightarrow Pt^{2+} \rightarrow Pt^0$. (7 refs.)

120149 Luminescence of oxygen in alkali halide crystals containing mercury-like activators. V.V.Pologrudov, E.N.Karnaukhov, A.G.Shneider (Sci.-Res. Inst. of Appl. Phys., A.A. Zhdanov State Univ., Irkutsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.365-7 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.642-6 (March 1983). [received: Oct. 1983]
Luminescence untypical of metal impurities or of O_2^- centers was observed on optical excitation of KCl, KBr, and KI crystals containing oxygen in the form of O_2^- and either Tl^+ or Pb^{2+} ions. A study was made of the excitation and luminescence spectra, of the temperature dependences of the luminescence and electrical conductivity, and of the luminescence decay kinetics. The results were analyzed within the framework of a model allowing for the fact that excitation creates a one-electron chemical bond between an absorbing O_2^- ion and a spatially separated electron activator trap. The bond is formed by an optical electron. (7 refs.)

120150 Characteristics of the spectral and luminescence properties of Nd^{3+} ions in γ-La_2S_3 semiconductor single crystals. A.A.Kamarzin, A.A.Mamedov, V.A.Smirnov, V.V.Sokolov, I.A.Shcherbakov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.328-31 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.557-62 (March 1983). [received: Oct. 1983]
Radiative transitions from states located above the $^4F_{3/2}$ metastable state were observed in a γ-La_2S_3:Nd^{3+} semiconductor single crystal. An analysis of the temperature dependences of the radiation spectra using time resolution spectroscopy, an analysis of the excited-state decay curves, and a comparison of the emission and absorption spectra were used to identify the intermultiplet transitions observed in the emission spectrum. It was found that neodymium ions could be excited in the fundamental absorption band of the host. (10 refs.)

120151 Degradation of the electronic excitation of the $^4F_{3/2}$ state of Nd^{3+} ions in a γ-La_2S_3 single crystal. A.Kamarzin, A.A.Mamedov, V.A.Smirnov, V.V.Sokolov, I.A.Shcherbakov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.336-9 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.569-73 (March 1983). [received: Oct. 1983]
An investigation is made of processes of population and relaxation of the $^4F_{3/2}$ neodymium upper active level in a γ-La_2S_3 semiconductor single crystal and the energy transfer microparameters are determined. Nonradiative transfer of energy from a continuous set of traps to the $^4F_{3/2}$ upper active level of neodymium was observed when the sample was excited with $\lambda=0.53$ μ radiation and cross relaxation from excited states located above the $^4F_{3/2}$ upper active level was identified. (11 refs.)

120152 The effect of rare-earth admixture on GaSe crystals radiation in the indirect transition. O.V.Fialkovskaya, P.A.Skubenko, Yu.P.Gnatenko, Z.D.Kovalyuk.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1351-4 (Sept. 1983). In Russian.
Polarization and temperature dependences of the luminescence spectra are investigated for rare-earth doped GaSe single crystals. It is shown that the use of Nd and Gd dopants in 0.01-0.1 wt.% concentrations considerably enhances the intensity of the luminescence 2.061 eV energy band. This is explained by emission of indirect bound excitons. The localization of indirect excitons is assumed to be due to localized lattice deformation arising from doping. (6 refs.)

120153 Characterisation of silicon crystals by means of photoluminescence measurements. W.Ziegler, R.Nebelung, N.Stein, H.Roppischer, F.Dybowski, S.Heide.
Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.153-63 (1983). In German.
Methods for obtaining photoluminescence spectra over the excitation range 0.75 eV to 1.2 eV are shown for arsenic-implanted silicon, both before and after laser-annealing. Lateral variation of luminescence at two wavelengths is also shown for P+ implantation, and the effect of anodic oxidation is indicated. Finally, luminescence measurements were made on a sample which was progressively sectioned to a depth of 500 nanometers. Measurements at 4.2K, 77K and 300K are recommended. (10 refs.) *G.M.E.*

120154 Fluorescence spectra and crystal field analysis of rare earth oxyhalides and oxysulfates doped with trivalent europium and terbium. J.Holsa.
Helsinki Univ. Technol., Espoo, Finland thesis, 1983. Espoo, Finland: Helsinki Univ. Technol. (1983), 58 pp.
A crystal field (c.f.) analysis of Eu^{3+} doped RE oxyhalides, REOX:Eu^{3+}, (RE=Y, La and Gd; X=Cl, Br and I) and Tb^{3+} doped RE oxychlorides, REOCl:Tb^{3+} (RE=Y, La, and Gd), was conducted on the grounds of the corresponding fluorescence spectra. The sets of c.f. parameters calculated on the basis set of 49 $^7F_{JM}$ levels reproduce the experimental energy level schemes within rms deviations of 4-8 cm^{-1}. The strength of the crystal field decreases with decreasing ionic size of the host cation and with increasing ionic size of the host anion. Similar results were obtained for the REOCl:Tb^{3+} series. The evolution of the c.f. parameter values from REOCl:Eu^{3+} to REOCl:Tb^{3+} is in agreement with the results of an electrostatic point charge calculation and may thus be used to predict the c.f. effect in other RE^{3+} ions in REOCl. The calculation of individual parameter values by this model was not possible because of strong 'covalency' effects in RE oxyhalides. The Racah parameters and the spin-orbit coupling constant were calculated from the REOCl:Eu^{3+} and REOBr:Eu^{3+} excitation spectra. (82 refs.)

120155 Radiative recombination with the participation of isoelectronic traps in solid solutions $In_{1-x}Ga_xP_{1-z}As_z$ doped with bismuth. O.N.Ermakov.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.133-7 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.155-60 (Jan. 1983).
Photoluminescence and cathodoluminescence were used to investigate the radiative recombination properties of $In_{1-x}Ga_xP_{1-z}As_z$:Bi solid solutions as a function of composition. The role of Bi impurity and isoelectronic centres is discussed. (15 refs.)

120156 Analysis and classification of layer-by-layer heterogeneities of microstructures. A.I.Drobyshev, I.V.Ogurtsova, Turkin Yu.I..
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.107-9 (Aug. 1983). In Russian.
Possible classification of layer-by-layer heterogeneities of microstructures using dispersive analysis is considered. Layer-by-layer analysis of monocrystalline plates of gadolinium-gallium garnet is carried out by means of emission spectroscopy with a hollow cathode discharge. Experimental results reveal three types of layer-by-layer heterogeneity in the objects analysed. (3 refs.)

78.60K Thermoluminescence

120157 Effect of γ-irradiation on the thermoluminescence of phosphorescent zinc sulphide. J.K.Zope (Dept. of Phys., Shivaji Univ., Kolhapur, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.816-17 (Oct. 1982). [received: April 1983]
Thermoluminescence (TL) measurements are made on γ-ray irradiated and unirradiated zinc sulphide powder samples. Phosphorescent zinc sulphide powder was irradiated by ^{60}Co γ-ray source of 1.55 MeV strength, for a period of 2 and 3 hr respectively. It is observed that the (TL) glow peak maximum shifts to lower temperature for the irradiated samples. The density of carriers is calculated for the irradiated and unirradiated samples. Applying Beaven's approach, the order of kinetics is determined. An analysis of the glow curves shows that the order of kinetics remains the same though the density of carriers increases in the irradiated samples. (9 refs.)

120158 Optical absorption and thermoluminescence of bismuth-doped NaCl single crystals irradiated with X-rays. M.R.Sen, A.V.K.Rao, K.V.Rao (Dept. of Phys., Indian Inst. of Technol., Kharagpur, India).
J. Mater. Sci. (GB), vol.18, no.10, p.3072-8 (Oct. 1983).
The optical absorption in the wavelength range 200 to 800 nm of Bi-doped NaCl single crystals (0.08 and 1.3 mol.%) before and after X-ray irradiation for different times, has been measured. The partial thermal bleaching characteristics of NaCl:Bi (1.3 mol.%) irradiated for one hour have been studied. The thermoluminescence (TL) curves of the doped samples irradiated for one hour have been recorded. These measurements indicate conversion of Bi^{3+} to Bi^{2+} in the doped samples with X-ray irradiation; however, when NaCl:Bi (1.3 mol.%) is X-ray irradiated for larger times than one hour, Bi^+ and Bi^0 seem to be formed also. (11 refs.)

120159 Trapping parameters for peak XII in LiF TLD-100. S.P.Kathuria (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India), S.V.Moharil.
J. Phys. D (GB), vol.16, no.10, p.2011-16 (14 Oct. 1983).
Isothermal decay of TL peak XII recorded at five different temperatures, viz. 680, 693, 701, 711 and 719K, is shown to be non-exponential. The data when fitted into the May and Partridge equation yield the order of kinetics value between 1.3 and 1.4. Activation energy E and frequency factor s are determined independent of each other from isothermal decay data using a recently suggested method. Also the trapping parameters E and s are determined using a new method based on the fundamental TL equations of Antonov-Romanovski. The values obtained by the two methods are 1.83 eV and 1.76 eV for E and 2.8×10^{11} s^{-1} and 2.1×10^{11} s^{-1} for s respectively and these are in good agreement with each other. (9 refs.)

120160 Trapping parameters for non-saturation doses. S.V.Moharil (Dept. of Phys., Nagpur Univ., Nagpur, India), S.P.Kathuria.
J. Phys. D (GB), vol.16, no.10, p.2017-21 (14 Oct. 1983).
In recent papers the authors (see ibid., vol.16, p.425, 1983) have described methods for obtaining trapping parameters from thermoluminescence curves. The methods are applicable when the traps are filled to saturation concentration. Here, the problem of obtaining trapping parameters from TL curves recorded under non-saturation conditions is discussed. (11 refs.)

120161 Effect of post-irradiation deformation on thermoluminescence spectra of KCl:Ca and NaCl:Ca crystals. J.Manam (Dept. of Phys., Indian Inst. of Technol., Kharagpur, India), R.K.Gartia, V.V.Ratnam.
Phys. Status Solidi a (Germany), vol.79, no.1, p.167-71 (Sept. 1983).
The effect of post-irradiation deformation on the thermoluminescence spectra of KCl:Ca and NaCl:Ca crystals is studied. Deformation does not cause any appreciable change in the recombination mechanisms and sites as revealed by the occurrence of the peaks in TL emission in the same spectral regions. The deformation causes only a preferential redistribution of the traps as revealed by the changes in the relative intensities of the emissions occurring in almost the same regions. The results in KCl:Ca are in conformity with observations of Arsenovici and Townsend (1972) on the redistribution of F-centres by F-light bleaching, whereas in NaCl:Ca they are in disagreement. (9 refs.)

120162 Thermoluminescence of thallium-doped BaFCl. K.Somaih (Dept. of Phys., Post-Graduate Coll. of Sci., Osmania Univ., Saifabad, India), V.Hari Babu.
Phys. Status Solidi a (Germany), vol.79, no.1, p.237-42 (Sept. 1983).
The effect of doping of Tl upon thermoluminescence, its emission and optical absorption in flux grown BaFCl crystals is investigated. Besides an increase in luminescence output, X/γ-irradiations of BaFCl:Tl crystals produce three

additional glow peaks at 450, 465, and 500K and a TL emission spectrum at 460 nm. Optical absorption studies reveal two small bands at 340 and 650 nm. Room temperature annealing studies indicate that the three glow peaks at 450, 465, 500K and the optical absorption band at 650 nm are more stable than others present in undoped crystals. Thus the additional glow peaks are attributed to the detrapping of electrons from the substantial number of metastable energy levels as populated by the thallium impurity and subsequent radiative recombination with holes. The trap depth and frequency factor are calculated employing various methods. (12 refs.)

120163 Analysis of thermoluminescence data dominated by second-order kinetics. R.Chen, D.J.Huntley, G.W.Berger (Dept. of Phys., Simon Fraser Univ., Burnaby, British Columbia, Canada).
Phys. Status Solidi a (Germany), vol.79, no.1, p.251-61 (Sept. 1983).
In the analysis of the thermoluminescence glow curves, and in particular when applied to TL dosimetry and TL dating of archaeological and geological samples, a first order behaviour of the peaks involved is usually implicitly assumed. In this work the TL response for second order kinetics is described and shown that the usual analysis, in which a linear growth of TL with excitation dose is assumed, is correct to a good approximation provided that the curves are first shifted in temperature so that their peaks coincide. This is true for a single isolated peak and for a series of overlapping peaks. (26 refs.)

120164 Fractional order of kinetics and its variation with trap occupancy in LiF TLD-100. S.P.Kathuria, C.M.Sunta (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K77-80 (Sept. 1983).
Moharil (1981) has used the authors' data to recompute the TL (thermoluminescence) parameters. Based on his computations he agreed with the fractional order but contradicted the conclusion that the numerical value of the order of kinetics changes with trap occupancy, until the intensity of the glow peak has fallen to less than 20% of its saturated value at 165°C. The authors point out the errors in Moharil's treatment which led him to the paradoxical result like negative value of activation energy and thereby to contradict their conclusion. (7 refs.)

120165 Reply to 'Fractional order of kinetics and its variation with trap occupancy in LiF TLD-100' by S.P. Kathuria and C.M. Sunta. S.V.Moharil (Dept. of Phys., Nagpur Univ., Nagpur, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K81-4 (Sept. 1983).
For comment see ibid., vol.79, p.K77 (1983). Kathuria and Sunta concluded from the isothermal decay of peak V of LiF TLD-100 that when traps are filled to saturation concentration, the order of kinetics (b) varied from 1 to 1.6 for decay times up to 3 min. A steady value (1.6) is obtained thereafter. This variation was not apparent in the glow curve, when Chen's method was used for calculating the trapping parameters. The reason given was that a sufficient number of traps were emptied and a constant b value was attained before any of the temperatures T_1, T_m, or T_2 could be reached. (4 refs.)

120166 Trap-level spectroscopy using the 'nonequilibrium-phase-transition model' of thermally stimulated luminescence. A.G.I.Dalvi, M.D.Sastry, B.D.Joshi (Radiochem. Div., Bhabha Atomic Res. Centre, Bombay, India).
Phys. Rev. B (USA), vol.28, no.5, p.2441-6 (1 Sept. 1983).
By considering thermally-stimulated-luminescence (TSL) phenomena as analogous to a nonequilibrium phase transition, it is shown that TSL obeying both first- and second-order kinetics can be uniquely characterised by the transition temperature T_c which is identified as the temperature at which the rate of decay of luminescence is maximum under near-isothermal conditions. The trap depth E, the frequency factor (for $T \ll T_c$) s_0, and T_c are shown to be related by the equation $2\exp(E/kT_c)=s_0(\tau/\xi)$ (where τ is the characteristic electron-hole recombination time and ξ a constant of proportionality associated with electron-hole recombination kinetics). (24 refs.)

120167 The field fluctuational model of thermally stimulated processes in ferroelectric $LiNbO_3$. I.Tale, T.Tale (Inst. for Solid State Phys., Latvian State Univ., Riga, Latvian SSR), J.Rosa.
Solid State Commun. (USA), vol.48, no.2, p.135-7 (Oct. 1983).
The thermally stimulated processes in the *X*-irradiated $LiNbO_3$ crystals were studied by the fractional glow technique. The trap ionization with unusually high values of the mean activation energy and the effective frequency factor as well as decreasing the activation energy of the traps when the temperature increased from 150-180K were observed. The authors suggest that all these effects are due to the ion-fluctuation process (the electric field generated by thermal reorientation of dipoles). (9 refs.)

78.60M Sonoluminescence, triboluminescence

120168 Triboluminescence of fluorites. G.N.Chapman (Phys. Dept., Open Univ., Milton Keynes, England), A.J.Walton.
J. Phys. C (GB), vol.16, no.28, p.5543-51 (10 Oct. 1983).
The room-temperature triboluminescent spectra of single crystals of CaF_2:1% Tb, CaF_2:1% Dy, CaF_2:1% Sm and CaF_2:1% Eu have been recorded using a high-gain image intensifier spectrograph. The spectra, obtained as the crystals were cut with a diamond-impregnated circular saw, show significantly more structure than that recorded in the room-temperature photoluminescent spectra. In fact the triboluminescent spectra show structure comparable with that seen in liquid-nitrogen-temperature photoluminescent spectra. Although the details of the excitation mechanism remain obscure, the triboluminescent spectra undoubtedly arise from the rare-earth dopants. It is suggested that the observed splitting of the lines attributable to the triply ionised rare-earth dopants is due to the rapidly changing crystal fields within the vicinity of a growing crack. Spectral measurements made on a natural fluorite mineral show that part, but not all, of the triboluminescent emission produced on cutting an irradiated sample may have a thermoluminescent origin. (25 refs.)

120169 Pressure and temperature dependence of the mechanoluminescence of γ-irradiated alkali halide crystals. B.P.Chandra, M.Elyas, B.Majumdar (Dept. of Phys., Government Sci. Coll., Raipur, India).
Phys. Status Solidi a (Germany), vol.79, no.1, p.95-102 (Sept. 1983).
The intensity of mechanoluminescence (ML) produced during application and release of uniaxial pressure, in γ-irradiated KBr, KCl, KI, LiF, and NaCl crystals decreases with the number of applications and releases of the pressure. The ML intensity of γ-irradiated KBr, KCl, LiF, and NaCl crystals increases with the temperature; however, the ML intensity of γ-irradiated KI crystals decreases with the temperature. The ratio of the ML intensity during the release of the pressure to the ML intensity during the corresponding number of applications of the pressure, decreases with the temperature of the crystals. Assuming that the movement of dislocations is responsible for the ML excitation, the pressure and temperature dependence of the ML is discussed. The activation energy related to the increase in the number of dislocations with the temperature is estimated from the ML measurement and it is found to be 0.24, 0.25, 0.24, and 0.32 eV for γ-irradiated KBr, KCl, LiF, and NaCl crystals respectively. (14 refs.)

78.65 OPTICAL PROPERTIES OF THIN FILMS

120170 Electroreflectance and crystal structure of thin zinc sulfide films. J.A.Lahtinen, T.Tuomi.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.97-102 (1983).
Electroreflectance spectra of polycrystalline ZnS:Mn thin films grown by atomic layer epitaxy and electron beam evaporation techniques for electroluminescent devices are measured in the photon energy range from 3.0 eV to 4.5 eV. From the E_0 direct electron transition peaks observed at 3.74 eV and 3.71 eV it is concluded that the crystal structure of the ZnS thin films grown by atomic layer epitaxy is almost hexagonal 2 H whereas that of the films grown by electron beam evaporation is close to polytype 4 H or 6 H. (20 refs.)

120171 Methods of determining optical constants of thin semiconductor films using normal incidence reflectance and transmittance data. D.R.Mckenzie, R.C.McPhedran, N.Savvides (School of Phys., Univ. of Sydney, Sydney, New South Wales, Australia), L.C.Botten, P.J.Martin, R.P.Netterfield.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.110-17 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Techniques for determining the optical constants of thin absorbing films are described and applied to the evaluation of the optical constants of carbon and silicon amorphous semiconductor films prepared by magnetron sputtering and ion beam sputtering techniques. The results are discussed with emphasis on the nature and origin of the optical gaps. (6 refs.)

120172 Physical and electrochemichromic properties of RF sputtered tungsten oxide films. K.Miyake, H.Kaneko, N.Suedomi, S.Nishimoto (Faculty of Engng., Yamaguchi Univ., Ube, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.5256-61 (Sept. 1983).
The physical and electrochemichromic properties of RF sputtered tungsten oxide films from a compressed powder WO_3 target have been investigated. This report mainly concerns the dependence of the properties on the total pressure of the sputtering atmosphere. The oxide films, 5000-5300 Å thick, were deposited on substrates maintained at 200°C under total pressures of 5×10^{-3}-8×10^{-2} Torr in an atmosphere of Ar gas or Ar-5% O_2 mixture. The physical and electrochromic properties of the oxide films prepared are dependent on the total pressure during deposition. The electrical resistivity ranges from 4.75×10^{7} to 3.33×10^{11} Ω cm depending on the pressure. From X-ray analysis, the films prepared under pressures of 5×10^{-3}-1.5×10^{-2} Torr were found to be crystalline and assigned a composition of $WO_{2.83}$. The films prepared under pressures of 1.8×10^{-2}-8×10^{-2} Torr were found to be amorphous. Electrochemical coloration of these oxide films was observed using an asymmetric cell, and the coloration characteristics of the oxide films were found to be dependent on the electrical resistivity and structure of the films. The amorphous films with high resistivity have good electrochromic properties, but the crystalline films with low resistivity are hardly colored. The optical band gap, refractive index, and density of the oxide films are described. (14 refs.)

120173 Optical properties of laser-melt-quenched Au-Si alloys. E.Huber, M.von Allmen (Inst. of Appl. Phys., Univ. of Bern, Bern, Switzerland).
Phys. Rev. B (USA), vol.28, no.6, p.2979-84 (15 Sept. 1983).
Glassy films of Au-Si alloys were produced by nanosecond laser quenching in the composition range from 25-93 at.% Si. Reflection and transmission coefficients as well as electrical conductivity were measured from 1.4 to 5.4 eV. The complex dielectric function, obtained from Kramers-Kronig analysis, is presented. The optical properties of the Au-Si system over the whole phase diagram can be described using a Lorentz-Drude model with a free-electron term and a single-resonance bound-electron term. The authors conclude that two electronic transitions occur in the system: Si switches between the metallic and the semiconducting state at about 30 at.% Si, whereas Au switches from the metallic to a dielectric state at about 85 at.% Si. These two transitions of the constituents separate three regions of markedly different electronic behavior in the alloy. (41 refs.)

120174 Interference effects in detachment of surface electromagnetic waves from the edge of a metal substrate. E.A.Yakovlev, V.A.Sychugov, A.A.Khakimov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.364-5 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.611-12 (March 1983). [received: Oct. 1983]
It is shown that the distribution of surface electromagnetic waves in the far-field zone has distinct maxima and minima. It is shown that interference in a surface electromagnetic wave, which becomes detached from the edge of a metallized substrate, with a wave which is scattered by a device used to excite the surface wave and which propagates along the substrate, can account satisfactorily for the nature of the resultant distribution of radiation. (4 refs.)

120175 Influence of structure and surface behaviour on thin film light scattering. G.Schirmer, E.Hacker, U.Bergner, A.Biedermann, H.-G.Walther (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.77-85 (1983). In German.
Light scattering from optical films arises primarily from the structural irregularities in the volume as well as from microrough interfaces. In this work the authors describe some structural and interfacial influences on the stray light from optical films made of SiO_x, TiO_2 and Ta_2O_5 as well as mixtures made of Ta_2O_5/SiO_x and Ta_2O_5/TiO_2. 78.70 OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION

78.70B Positron annihilation

(see also 71.65 Positron states)

120176 Positron annihilation as a probe of electronic density in the two-dimensional conductor 1T-TaS_2. F.Boileau, B.Geffroy, R.Paulin (Inst. Nat. des Sci. et Tech. Nucleaires, CENS, Gif sur Yvette, France), P.Molinie, L.Zuppiroli.
J. Phys. (France), vol.44, no.10, p.1157-66 (Oct. 1983).
Tantalum disulfide is a layered compound with quasi-two-dimensional electronic conduction. The particular topology of the 2D-Fermi surface causes the onset of charge density waves which drive a metal-to-insulator phase transition in two steps. Three standard positron annihilation techniques have been used to sample the electronic density and momentum distributions in this compound as a function of temperature from 4 to 400K. The positron lifetime is 261(2)ps at 300K (single component) and does not change very much with temperature. It increases to 293(2)ps in a sample containing 1% of irradiation induced defects. The anisotropy of the momentum distribution is clearly visible both in angular correlation and Doppler broadening experiments. (22 refs.)

120177 On the temperature dependence of the positron annihilation spectrum from a single crystal of zinc. P.Rice-Evans, A.A.Berry, I.Chaglar (Dept. of Phys., Bedford Coll., London, England).
J. Phys. F (GB), vol.13, no.10, p.2197-201 (Oct. 1983).
The Doppler-broadened positron annihilation spectrum from a single crystal of zinc has been studied as a function of temperature and of the direction of photon emission. An anisotropy in the behaviour of the spectrum line height parameter was observed in the prevacancy temperature region with linear slopes $0.60\times10^{-4}K^{-1}$ in the [0001] direction and $1.02\times10^{-4}K^{-1}$ for [1010]. Optimum fittings with the two-state trapping model gave differing values for the monovacancy formation enthalpy, implying an inadequacy in the present understanding of the prevacancy rise. (13 refs.)

120178 The annihilation of the positron: a nondestructive research tool. A.E.Hughes.
Rev. Polytech. (Switzerland), no.8bis, p.1018-20 (Aug. 1983). In French.
The positron was discovered half a century ago. In the last fifteen years (1968-83), research on the way in which positrons are annihilated by electrons in solids can provide much information on defects in crystal lattices. This has led to the development of a new method of nondestructive testing. (no refs.) *J.S.*

78.70D X-ray absorption and absorption edges

120179 Theoretical studies of the X-ray absorption near-edge structures (XANES) of hydrogen adsorbed metals. T.Matsuura, T.Fujikawa, H.Kuroda (Faculty of Engng., Yokohama Nat. Univ., Yokohama, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3275-82 (Sept. 1983).
The authors theoretically investigate the possibility of obtaining information about hydrogen adsorption on meals by XANES spectroscopy. The theoretical method used in this study was proposed by the present authors. Three metals are chosen for the substrates; Ni, W and Pt. The calculated results show that the XANES spectroscopy is useful only for H on W system. In the other two systems observable changes caused by hydrogen adsorption are not observed in the XANES spectra.

120180 Experimental atom-to-solid L-level shifts for Ce, Sm, Gd, and Er. G.Materlik (DESY, Hamburg, Germany), B.Sonntag, M.Tausch.
Phys. Rev. Lett. (USA), vol.51, no.14, p.1300-3 (3 Oct. 1983).
The X-ray L absorption spectra were measured for the atomic rare-earth elements Ce, Sm, Gd, and Er. From the energy positions of well resolved absorption lines at threshold in comparison to the corresponding solid-state spectra the atom-to-metal shifts of the core-level binding energies have been determined. For Sm and Er which undergo a valence change on formation of the solid the shifts differ by more than 6 eV from those of Ce and Gd which have the same configuration in the atom and the solid. (19 refs.)

120181 Study of Cu K edge in some copper (II) octahedral complexes. P.Bhattacharya, A.R.Chetal (Dept. of Phys. & Math., Indian School of Mines, Dhanbad-Bihar, India).
Phys. Status Solidi b (Germany), vol.119, no.1, p.179-83 (1 Sept. 1983).
The K-absorption edge of copper in the complexes $Cu(LH)_2SO_4.4H_2O$, $Cu(LH)SO_4.4H_2O$, and $Cu(phen)(xant)_2$ is investigated using a Cauchois-type bent crystal X-ray spectrograph. The peaks A, B, and C observed in the edges are explained on the basis of molecular orbital theory. Peak positions are correlated with partial charge on the central metal ion. It is observed that the peak A shifts to the low-energy side while the peaks B and C shift to the high-energy side as the partial charge on an absorbing ion in the complex increases. (22 refs.)

120182 Data analysis in extended X-ray-absorption fine structure: determination of the background absorption and the threshold energy. J.J.Boland, F.G.Halaka, J.D.Baldeschwieler (Div. of Chem. & Chem. Engng., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.2921-6 (15 Sept. 1983).
Two approaches for the determination of the background absorption (μ_0) in the extended X-ray-absorption fine structure (EXAFS) are presented. Both methods, experimental and computational, take advantage of the damping of the EXAFS amplitude resulting from the convolution with Gaussian functions of different widths. In the experimental method two or more spectra are collected with the use of different spectrometer slit widths, resulting in spectra of different resolutions for the same sample. In the computational approach the convolution is accomplished via a convolution algorithm. The interesection points of the resulting spectra are used to generate μ_0. At the absorption edge, the spectra intersect at a unique point, which is shown to be a measure of the threshold energy, E_0. Illustration of the two methods for background removal is given for a copper-foil sample. The computation approach is superior to the experimental method of damping the EXAFS spectra to give μ_0. (10 refs.)

120183 *K*-shell excitation of D_2O and H_2O ice. Photoion and photoelectron yields. R.A.Rosenberg, P.R.LaRoe, V.Rehn (Michelson Labs., Naval Weapons Center, China Lake, CA, USA), J.Stohr, R.Jaeger, C.C.Parks.
Phys. Rev. B (USA), vol.28, no.6, p.3026-30 (15 Sept. 1983).
The yield of photoelectrons and photoions from condensed H_2O and D_2O ice near and above the oxygen *K* edge is reported. Results of studies in the near-edge region indicate that Rydberg excitations, which are quenched in the bulk, survive, to some extent, on the surface. Analysis of the extended X-ray absorption fine structure of the photoelectron yield above the edge yields an oxygen-oxygen scattering phase shift in good agreement with theory. (36 refs.)

120184 Extended X-ray-absorption fine-structure study of anharmonicity in CuBr. J.M.Tranquada, R.Ingalls (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3520-8 (15 Sept. 1983).
The extended X-ray-absorption fine structure (EXAFS) above the Cu and Br *K* edges in CuBr has been measured at 72, 210, and 295K. The first-shell contributions were isolated by Fourier filtering the EXAFS data, and the resulting single-shell data were analyzed using the ratio method. It is found that the third and fourth cumulants of the nearest-neighbor distance distribution are quite significant even at 210K and cannot be ignored when making least-squares fits to amplitude ratios and phase differences. At 295K the authors obtain values of $(0.37\pm0.05)\times10^{-3}$ Å^3 and $(0.72\pm0.12)\times10^{-4}$ Å^4 for the third and fourth cumulants, respectively, as well as an anharmonic contribution of $(0.16\pm0.12)\times10^{-2}$ Å^2 to the mean-square relative displacement. The data cannot be explained by a disorder model in which a Cu ion is allowed to occupy four equivalent off-center sites as well as its ideal position; the non-Gaussian contribution must be due to intrinsic anharmonicity. Interpretation of the results in terms of an anharmonic effective single-particle potential for the Cu ions indicates that the fourth-order potential term is just as important as the third and cannot be neglected. This model gives a reasonable description of the temperature dependence of the second, third, and fourth cumulants. (45 refs.)

120185 Anomalous saturation of mixed valence in cerium-based systems as studied by X-ray absorption. R.D.Parks, S.Raaen, M.L.denBoer, V.Murgai (Dept. of Phys., Polytech. Inst. of New York, New York, NY, USA), T.Mihalisin.
Phys. Rev. B (USA), vol.28, no.6, p.3556-8 (15 Sept. 1983).
The mixed valence of cerium-based metallic systems, as determined, for example, by X-ray-absorption experiments, never rises above 3.2-3.3. The L_{III} absorption-edge studies reported here show that this saturation effect occurs abruptly as a function of lattice constant (or composition) in the pseudobinary system $Ce(Pd_{1-x}Rh_x)_3$, in which it is possible to vary both continuously and rapidly the electronic properties. The saturation anomaly (at the valence 3.21) occurs at $x\approx0.2$, the composition where anomalous saturation effects have been previously observed in the magnetic susceptibility, electronic specific heat, and electrical resistivity. The values of the latter quantities at $x\approx0.2$ suggest a valency of $\sim$4, when interpreted within the promotional model. (11 refs.)

120186 Near-in fine structure of the $L_{2,3}$ absorption spectrum of metallic titanium. V.N.Sivkov, A.S.Vinogradov (A.A. Zhdanov State Univ., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.515-17 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.897-9 (March 1983). [received: Oct. 1983]
More detailed information on the near-in fine structure of the $L_{2,3}$ absorption spectra of Ti can be obtained by determining the spectral dependence of the absorption cross section σ for metallic titanium directly by the transmission method. The near-in fine structure of the $L_{2,3}$ absorption spectra of titanium was investigated by the X-ray photoabsorption method using an RSM-500 X-ray spectrometer-monochromator. The structure was determined using bremsstrahlung emitted by a tungsten anode of an X-ray tube. (11 refs.)

120187 The anisotropy of X-ray emission spectra for 2H-MoS_2 single crystals. Yu.M.Yarmoshenko, V.M.Cherkashenko, E.Z.Kurmaev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.103-12 (Sept. 1983).
The angular dependence of the polarised X-ray S $K\beta_1$ and Mo $L\beta_{2,15}$ spectra of single-crystal 2H-MoS_2 has been studied. A discussion of the experimental data obtained is performed on the basis of a local symmetry analysis of atoms. (19 refs.)

120188 Measurements of relative intensities of L shell X-rays in some high Z elements. S.Kumar, N.Singh, R.Mittal, K.L.Allawadhi, B.S.Sood (Dept. of Phys., Punjabi Univ., Patiala, India).
Natl. Acad. Sci. Lett. (India), vol.5, no.10, p.345-7 (Oct. 1982). [received: Oct. 1983]
The L shell X-ray relative intensities $I(L_{\alpha+1})/I(L_\beta)$ and $I(L_{\alpha+1})/I(L_\gamma)$ for Ta and $I(L_\alpha)/I(L_l)$, $I(L_\alpha)/I(L_\beta)$ and $I(L_\alpha)/I(L_\gamma)$ for Au, Hg, Tl and Bi have been measured for 59.57 keV gamma ray excited fluorescent X-rays. The experimental results are found to agree well with theory. (5 refs.)

120189 The forbidden transition $L_1N_{6,7}$ in Europium-63. B.D.Shrivastava, D.C.Gaur (School of Studies in Phys., Vikram Univ., Ujjain, India).
Natl. Acad. Sci. Lett. (India), vol.5, no.12, p.431-3 (Dec. 1982). [received: Oct. 1983]
Using a 40 cm curved mica crystal spectrograph of the transmission type, a new diagram line at λ 1536.7 XU corresponding to the forbidden transition L_1 $N_{6,7}$ in europium has been reported for the first time. This has been possible by successfully eliminating the K-spectrum of copper which is usually present in the commercially available demountable X-ray tubes. (8 refs.)

120190 Angular dependent X-ray K emission bands of sulphur in SnS_2 and MoS_2. W.Muller, G.Wiech (Sektion Phys., Univ. Munchen, Munich, Germany), A.Simunek.
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.66-8 (3 Oct. 1983).
For the metal dischalcogenides SnS_2 and MoS_2 the angular dependent K emission bands of sulphur were measured and calculated. Results are presented for take-off angles 15° and 70°. The characteristic features of the emission bands are related to the s, p, d character and the energy localization of the valence electrons. (16 refs.)

120191 Angular dependences of the spectra of soft X-ray excitation potentials of single crystals. B.E.Blekher, I.A.Brytov, V.V.Korablev.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.368-71 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.647-52 (March 1983). [received: Oct. 1983]
The existence of a nonmonotonic angular dependence of the amplitude in the spectra of soft X-ray excitation potentials was detected for the first time for single crystals. The effect was explained by the dynamic theory of diffraction. (12 refs.)

120192 Transmission of electromagnetic radiation through ferromagnetic metals via oblique magnons?. L.Kraus, D.Fraitova (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.417-20 (26 Sept. 1983).
A general secular equation for propagation vectors of waves propagating into a magnetically saturated ferromagnetic metal was obtained by a simultaneous solution of the Maxwell equations and Gilbert's equation of motion. It is shown that magnons propagating at oblique angles with respect to the normal of the surface of a tangentially magnetized sample have their penetration depths comparable with the classical skin-depth. It is proposed that oblique magnons may contribute to the transmission of electromagnetic radiation through a ferromagnetic metal. (15 refs.)

120193 Extended appearance-potential fine-structure analysis of Fe (110) surface. T.Ishida (Government Industrial Res. Inst., Osaka, Japan), H.Maeda, N.Kamijo, K.Ueda.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2973-5 (Sept. 1983).
In order to study the surface structure of a material, a method for detecting the extended appearance-potential fine-structure has been developed by measuring the peak-to-peak height of a particular Auger signal. Since Auger electron spectroscopy is highly sensitive to surface elements, the detection method is considered to be very useful to study atomic surface structures. The Fourier transform of the detected extended appearance-potential fine-structure curve of Fe (110) surface has exhibited a prominent peak at 2.47 Å, which is about 0.01 Å less than the nearest-neighbour bulk spacing in iron. (6 refs.)

120194 Intergranular segregation phenomena studied by AES. M.P.Seah (Div. of Materials Applications, NPL, Teddington, England).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.177-91 (1983). (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
Grain boundary segregation is an important phenomenon for the mechanical behaviour of many materials as well as their electrical and kinetic integrity. The most common method of characterisation is by Auger electron spectroscopy (AES). In this review the basic principles and limitations of the characterisation by AES will be defined in terms of detectability, the spatial resolution of the information, the quantification of the measurement and the aspects of characterisation that are directly possible. The intentions of the measurments are twofold: (i) diagnostic and (ii) to build a reliable predictive theory for segregation and for the effects of segregants on materials' behaviour. The developments of the theory for both the equilibrium segregation and the kinetics are illustrated by examples of AES studies from many laboratories in simple binary systems, in ternaries, and more complex commercial steels. This allows a clear framework to be established for most materials. (63 refs.)

120195 Low energy electron contributions to appearance potential and disappearance potential spectra. TiL_3. R.Konishi, M.Kinoshita, Y.Miyada, S.Kato (Dept. of Electronics, Tottori Univ., Tottori, Japan).
Oyo Buturi (Japan), vol.52, no.6, p.522-8 (June 1983). In Japanese.
In the present experiments, the electron energy distributions contributing to the $L_{3,2}$ Auger electron appearance potential (AEAP) and disappearance potential (DAP) spectra were studied. The specimens were evaporated Ti films, which were exposed up to 150 Langmuir O_2. In the case of the virgin surface before the exposure, the energy value of the L_3 dip of AEAP spectrum did not change when the low energy true secondary electrons were removed using retarding potential method. However, after the O_2 exposure, shifts of 0.4~0.6 eV were observed. The intensity of the $L_{3,2}$ DAP spectrum involving inelastically scattered electrons increases more than that of the pure DAP spectrum. The L_3 dip of DAP spectrum shifts to the higher energy side after the O_2 exposure. The probing depth of AEAP spectroscopy is larger than DAP spectroscopy. (11 refs.)

120196 Investigation of in-situ sputtered a-Si(H) by AES. J.Zemek, S.Koc (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.183-7 (July-Sept. 1983).
An in-situ Auger Electron Spectroscopic (AES) study of a-Si(H) and reference samples of freshly cleaved silicon (111) surface is reported. Further, the adsorption of oxygen up to the dose of 10^8 L has been investigated. Samples of a-Si(H) display a suppression of the Si $L_{23}M_{23}M_{23}$ transition and weaker tendency of their surface to molecular adsorption and oxidation. The dominant changes in spectra are attributed to Si-H bond character. (9 refs.)

120197 A simulation model for the secondary electron emission from metals. Application to the study of the Auger electron emission of aluminium. M.Cailler (Lab. de Phys. du Metal, Ecole Nat. Superieure de Mecanique, Nantes, France), J.-P.Ganachaud.
Scanning Electron Microsc. (USA), pt.1, p.85-97 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
In the authors' simulation, for the L_{23} VV Auger line of aluminium, the total Auger electron creation rate obtained by simulation is nearly 0.012 $Å^{-1}$ per incident electron near the surface for a primary energy of 1 keV and a normal incidence. The escape function estimated by the same method gives a result (~0.5) lower than that given by the exponential attenuation law. The discrepancy could come from the escape cone from the surface plasmon creation effects and from the elastic collisions suffered by Auger electrons along their path. The Auger yield obtained by multiplying the creation rate and the escape function is about 0.006 at 1 keV. The simulation model also allows a quantitative description of the secondary emission and of the transmission of electrons through thin films. (46 refs.)

120198 Low-energy electron energy-loss spectra associated with reconstructed structure on Si (111) surface. Y.Shigeta, K.Maki (Dept. of Phys., Yokohama City Univ., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L391-3 (July 1983).
Low energy electron energy-loss spectra from the Si (111) surface were obtained under a surface wave resonance condition under which the wave vector of diffracted electrons is parallel to a row of the 1/7-order superlattice rods in 7×7 structure. A peak related to a surface dangling bond at 1.5 eV in the energy-loss value ΔE, and a peak due to the excitation of a surface plasmon at $\Delta E=8.5$ eV are enhanced at each height. Surface plasmon peak shifts to 10.5 eV when the condition is not satisfied. When the surface changes from a 7×7 structure to a 1×1, the decrease in these peak heights is also observed. (7 refs.)

120199 Energy spectrum of electrons of solid solutions in the TiC-TiN system. E.A.Zhurakovskii, M.I.Lesnaya, K.S.Proskurka, A.A.Sotnik (Inst. of Problems of Materials Sci., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.10, p.1478-82 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1721-5 (Oct. 1982). [received: Sept. 1983]
The results of the investigation of the spectra of solid solutions in the TiC-TiN system showed that it consists of individual, partially overlapping bands, which are generally related to the carbon and nitrogen 2s and 2p states and on the Ti 3d and 4s states and that the chemical bonding gradually changes its character from almost covalent in the solid solutions close in composition to TiC to metallic-covalent in the solid solutions close in composition to TiN. (14 refs.)

120200 Energy spectra of backscattered electrons for solid films and double layers by use of Werner's analytic model. S.Rogaschewski (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.149-59 (Sept. 1983).
Expressions for the energy spectrum of electrons backscattered from solid films and double layers as a function of incident electron energy, angle of incidence, film thickness, and atomic number of target are derived from Werner's analytic model (1978). Values calculated from these expressions agree well with existing experimental and Monte Carlo data. (31 refs.)

120201 Orientation dependence of core edges from anisotropic materials determined by inelastic scattering of fast electrons. R.D.Leapman, P.L.Fejes, J.Silcox (School of Appl. & Engng. Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2361-73 (1 Sept. 1983).
Electron-energy-loss spectra have been measured in the region of the *K* edges in graphite and hexagonal boron nitride. The fine structure is found to be strongly dependent on the crystal orientation and momentum transfer. Angular distributions of peaks in the spectrum have been recorded from crystals with the *c* axis parallel and at 45° to the beam direction. These agree well with the theoretical distributions for transitions to π^* and σ^* final states in a hybridised atomic-orbital model. Peaks in the energy-loss spectrum are compared with band calculations of the ground-state density of states. Some correspondence is found between these but there is also evidence of core excitons. (43 refs.)

120202 Double losses and overtones in electron-energy-loss studies of surface vibrations: the role of lateral interactions. J.C.Ariyasu, D.L.Mills (Dept. of Phys., Univ. of California, Irvine, CA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2389-402 (1 Sept. 1983).
Within a simple model of an ordered overlayer of adsorbed molecules on a crystal surface, the authors develop a theory of two-phonon losses in the regime of small-angle scattering, where dipole losses dominate. Two features which correspond to a double loss and excitation of an overtone are identified in the model, and they study the role of lateral interactions on each of the these. They find that the lateral interactions shift the overtone relative to the double loss; the overtone loss band may also have both its width and shape influenced significantly. The implications of these results are discussed, most particularly as they relate to estimates of dissociation energies by the Birge-Sponer extrapolation procedure. (13 refs.)

120203 Surface ion-electron emission from metals. M.Soszka, W.Soszka (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.255-61 (Sept. 1983).
Ion bombardment of the nickel polycrystalline target covered by adsorbed and contaminant particles leads to the escape of surface electrons with discrete energies which are characteristic for covering particles (surface ion-electron emission—SIEE). Surface electrons leave the polycrystalline target in distinctly defined directions relative to the escape of the recoil particles but independently of the incident angle. This fact suggests that anisotropy has an elementary character and, probably, it is connected with a manner of electron creation. From angular profiles the energy spectrum of surface electrons was reconstructed. The position of the peaks on the reconstructed energy distribution curve is extremely stable in the time. It was found that SIEE depends on the bombarding time, ion beam density, energy of projectiles and gas exposure of the target. A simple model of the surface ion-electron emission from the real surface of metals is discussed. (6 refs.)

120204 Modification of the surface due to ion bombardment: an XPS study. F.Werfel, E.Suoninen.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.171-6 (1983).
XPS valence band measurements have been used to observe the surface alteration of transition metal oxides due to Ar^+ ion bombardment. V_2O_5 and MoO_3 surfaces change under ion bombardment to lower oxidation states. Sputtering of Pd metal causes drastic XPS valence band changes. (17 refs.)

120205 Detection of surface atoms by energy analysis of scattered primaries and recoiled secondaries from CsBr under Ar^+ and Ar^{2+} bombardment. J.A.Schultz, R.Kumar, J.W.Rabalais (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.214-18 (9 Sept. 1983).
Time-of-flight (TOF) and electrostatic sector analysis (ESA) have been used to measure particles scattered and sputtered by direct recoils and surface recoils during 3 keV Ar^+ and 6 keV Ar^{2+} bombardment of CsBr at forward and backscattering angles. Charge fractions of scattered argon and recoiling surface atoms are obtained. Hydrogen and oxygen surface impurities are detected predominantly as directly recoiled neutrals. (17 refs.)

120206 A double rainbow interpretation of rotational energy transfer in energetic NO/Ag(111) collisions. H.Voges, R.Schinke (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.245-50 (9 Sept. 1983).
The mechanism of rotational energy transfer in energetic ($E \lesssim 1$ eV) NO/Ag(111) collisions is investigated in quantal rigid-rotor/static-surface calculations. Reasonable agreement with recent experimental results is obtained for the case of a strongly asymmetric interaction potential which leads to two well-separated rotational rainbows at low and at high $E_{\rm rot}$, respectively. (24 refs.)

120207 Erosion of polymer thin films during ion bombardment. M.Braun, B.Emmoth, G.M.Mladenov, H.E.Satherblom (Res. Inst. of Phys., Stockholm, Sweden).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1383-7 (1983).
Thin films of photoresist material (PMMA and AZ 1450J) have been irradiated by H^+ and He^+ ions in the low MeV energy region. The composition and thickness of the irradiated layers were determined by RBS techniques. It was found that the composition of the PMMA layer is subject to a drastic change in the initial state of the ion bombardment. The erosion rates of the polymer materials were also measured and were found to vary between 100-20000 atoms/incoming ion. This could not be explained by conventional sputtering theories. It is assumed that these high erosion rates and compositional changes are connected with the electronic losses of the bombarding ions, giving rise to a bond breaking phenomenon of the resist molecules. (17 refs.)

120208 Sputtering negative carbon ions from cesiated graphite surfaces. A.Pargellis, M.Seidl (Dept. of Phys., Stevens Inst. of Technol., Hoboken, NJ, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1388-93 (1983).
The sputtering of negative carbon ions from graphite targets bombarded with Cs^+ ions has been studied. The energy of the Cs^+ ions has been varied from 200 V to 20 kV. The targets studied were polycrystalline, pyrolytic and vitreous graphite. The negative ion yield strongly depends on the amount of cesium adsorbed on the surface and intercalated into the bulk of the graphite. The optimum C^- ion yield is 0.5 to 0.6 C− ions per incident Cs+ ions for a bombarding energy of 10 keV and for a target temperature of 200°C. The yield is independent of the graphite structure. In addition to C^- ions, negatively charged clusters of carbon ions up to C^-_{19} were sputtered from polycrystalline and pyrolytic graphite. Sputtering from vitreous graphite produces only light clusters, up to C^-_4. (21 refs.)

120209 Chemical sputtering of carbon by sub-eV atomic hydrogen: new results and a critical comparison with previous data relevant to fusion applications. P.C.Stangeby, O.Auciello, A.A.Haasz (Inst. for Aerospace Studies, Univ. of Toronto, Downsview, Ontario, Canada).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1425-9 (1983).
The production of methane on carbon (papyex) surfaces under sub-eV atomic hydrogen bombardment has been measured in an ultrahigh vacuum system subjected to special cleaning procedures. These results and previously published methane yield results are compared and their applicability to fusion technology is assessed. A critical analysis of the available data leads to the following conclusions: (i) The inconsistent methane yields spanning four orders of magnitude are most likely due to different experimental procedures. (ii) The monotonically decreasing methane yield as a function of sample temperature, obtained by some groups, is most probably due to the fact that deactivated surfaces were exposed to hydrogen bombardment. (iii) The methane yields which present a maximum at a certain temperature in the range 700-850K resulted from bombardment of activated surfaces; and (iv) the shift in temperature at which the methane yield maximum occurs in the different studies may be due to temperature nonuniformities over the exposed surfaces and/or different states of activation. (21 refs.)

120210 Electron transfer in the reflection of ions/atoms from metal surfaces using the time-dependent Newns-Anderson Hamiltonian. K.L.Sebastian (Inst. fur Phys. Chemie, Univ. Munich, Munich, Germany).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.39-43 (3 Oct. 1983).
A procedure for taking electron correlation into account in the transfer of electrons to or from ions/atoms reflected from metal surfaces is suggested. The procedure makes use of the fact that the time-development operator for a two-body Hamiltonian can be written as a functional average of the time-development operator for a one-body Hamiltonian. Using this, the transfer probability is written as a functional integral. Finding the stationary path of the 'action' of this functional integral leads to time-dependent Hartree-Fock (TDHF) like equations. These equations are more complicated than TDHF equations, but have the advantage of going beyond the TDHF theory. (8 refs.)

120211 Neutral-atom scattering from random isolated adsorbate atoms on clean metal surfaces: oxygen and carbon monoxide on nickel (001). J.Ibanez, N.Garcia (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Canto Blanco, Madrid, Spain), J.M.Rojo.
Phys. Rev. B (USA), vol.28, no.6, p.3164-72 (15 Sept. 1983).
The intensity I of the specular beam of a helium nozzle beam scattered from a Ni(001) surface has been measured as a function of adsorbate coverage Θ for both oxygen and CO exposures at 350K for different angles of incidence. A linear relationship is found between ln (I/I_0) (I_0, the intensity of the specular beam from the clean surface) and Θ up to $\Theta=0.15$ monolayer of O on Ni and $\Theta=0.1$ monolayer of CO on Ni. A model is proposed in which the scattering is governed by the repulsive part of the gas-surface potential, the latter being described by a hard-wall corrugation. A constant attractive well depth and a temperature-dependent vibration amplitude of the atoms are also incorporated into the model. The adsorbate atoms are treated as a shot noise on a flat metal surface. By means of suitable averaging, a formula is found that explains the linear dependence indicated. From the best fit of the model to the experimental data, a set of parameters describing the corrugation of a single adsorbate is derived. Cross sections for the helium-adatom scattering are 65 and 26 Å² for CO and O, respectively. The corresponding corrugations have been fitted with Gaussians of height 0.62 Å (for CO) and 0.32 Å (for O). (26 refs.)

120212 Comparison of specular H-atomic-beam intensity and C^+ secondary-ion yield at thermally activated decrease of a carbon layer on a Ni (110) surface. H.Kaarmann, H.Hoinkes, H.Wilsch (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Phys. Rev. B (USA), vol.28, no.6, p.3561-3 (15 Sept. 1983).
The thermally activated disappearance of a carbon layer on a Ni (110) surface was investigated by the scattering of atomic hydrogen and by secondary-ion mass spectrometry. Decreasing C coverage at surface temperatures kept constant in each case at values between 650 and 750K resulted in an exponential decrease of specular H-beam intensity as well as C^+ secondary-ion yield. This decrease in both cases fits first-order kinetics (presumable diffusion into the bulk) with an identical rate constant as a function of surface temperature and results finally in a preexponential frequency $\nu=10^{(10\pm1)}$ s^{-1} and an activation energy $E_A=1.8\pm0.2$ eV. (9 refs.)

120213 Secondary ion mass spectroscopy applications in semiconductor technology: III-V compound and other material structures. T.Ambridge (British Telecom Res. Labs., Ipswich, England).
Scanning Electron Microsc. (USA), pt.1, p.31-43 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
Secondary ion mass spectrometry (SIMS) is becoming widely applied to problems in semiconductor technology, as exemplified by the following: a) trace analysis down to 1 part in a thousand million (ie about 5×10^{13} cm^{-3}) is routinely achieved for many important donors and acceptors (e.g. Si, Se, Te, B, in GaAs). b) detailed depth profiles in GaAs grown by molecular beam epitaxy have clearly identified two problems: i) close compensation of intentional S donors by Mn acceptors, at the mid 10^{15} cm^{-3} level, incorporated from a spurious source; ii) absence of intended Sn donors, but presence of Te donors at the mid 10^{17} cm^{-3} level, ascribed to impurity of the As source material; c) the uniformity of low dose Se ion implantation (2.25×10^{12} cm^{-2} at 225 keV energy) over a 50mm diameter GaAs wafer has been mapped, confirming it to be within better than about ±10%, except within an unexpected uniplanted region which was revealed. More advanced applications to multilayer III-V alloy semiconductor structures (for lasers), integrated circuits, and optical fibres are briefly touched upon. Strong emphasis is placed on the complexities, and potential pitfalls in SIMS data interpretation, related to mass interferences, surface contamination, choice of instrumental conditions and the quantification procedures. 79.40 THERMIONIC EMISSION

120214 Emission characteristics of single-crystal LaB_6 cathodes with large tip radius. Y.Furukawa, M.Yamabe, T.Inagaki (Fujitsu Labs. Ltd., Atsugi-shi, Japan).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1518-21 (1983).
Emission characteristics of single-crystal LaB_6 cathodes of ⟨100⟩, ⟨110⟩, ⟨111⟩, ⟨210⟩, ⟨310⟩, and ⟨321⟩ orientations, with large tip radius (100 μm), were investigated. In cathodes of small tip radius (less than 10 μm) emission from the conical face is dominant, as it has the small area of the top surface. Cathodes of large tip radius have a large emission area at the top surface, which includes various crystal faces, according to the orientation and the cone angle. It has become clear that it is important to use as the tip axis the orientation having rotational symmetry and a crystal face of low work function at the cathode top to get good beam uniformity. In this respect the ⟨100⟩ cathode was found to be superior to cathodes of other orientations. Emission characteristics of the ⟨100⟩ cathode during long-term operation were investigated. A flat (100) face was formed at the top due to LaB_6 material consumption, and emission characteristics reflecting this tip shape were measured. (8 refs.)

79.60 PHOTOEMISSION AND PHOTOELECTRON SPECTRA

120215 Core-level photoelectron spectroscopy of surfaces and adsorbates. T.-C.Chiang (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Comments At. & Mol. Phys. (GB), vol.13, no.6, p.299-309 (1983).
Recent experiments in photoemission from core levels for surfaces and adsorbates are reviewed. Core level shifts for single crystal surfaces relative to the bulk as well as core level shifts induced by adsorption are discussed. The relationships between the observed shifts and the surface electronic properties and the surface atomic structures are illustrated. Several examples are adsorbed rare gases, semiconductor and metals surfaces and their interfaces are presented. (22 refs.)

120216 XPS studies of vanadium and vanadium oxides. J.Kasperkiewicz, J.A.Kovacich, D.Lichtman (Phys. Dept., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.123-32 (Sept. 1983).
XPS (ESCA) measurements are presented of the X-ray-induced photoelectron lines and Auger transitions of metallic vanadium and of two vanadium oxides. The oxidation states of vanadium are compared and discussed for vanadium in the maximal valence state, with a $3d^0$ electron configuration, and in the state with a $3d^1$ electron configuration. (11 refs.)

120217 d-orbital-directed X-ray photoemission from some transition-metal fluoride single crystals and associated calculations. K_2FeF_5. K.Broomfield, P.M.A.Sherwood (Dept. of Inorganic Chem., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1321-9 (Sept. 1983).
Angle-resolved photoemission energy distributions (PED) have been obtained from the valence and core regions of a single crystal of potassium iron(III) fluoride (K_2FeF_5) using Mg $K\alpha$ radiation. Ground state SCF $X\alpha$ calculations on the $FeF_6{}^{3-}$ cluster showed that the bonding e_g and t_{2g} orbitals had more metal 3*d* character than the antibonding orbitals of the same symmetry type, so that one could expect to see *d*-orbital-induced angular variation in most regions of the spectrum. The observed PED were found to be consistent with the matrix-element model when both *p*- and *d*-orbital effects were taken into account, and peak separations were determined by an SCF $X\alpha$ transition-state calculation on the $FeF_6{}^{3-}$ cluster. (11 refs.)

120218 XPS spectra of $BF_4{}^-$ doped polypyrrole in states of different conductivity. R.Erlandsson, I.Lundstrom (Dept. of Phys. & Measurement Technol., Linkoping Univ., Linkoping, Sweden).
J. Phys. Colloq. (France), vol.44, no.C-3, p.713-15 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have measured the N(1s) binding energy of polypyrrole in states of different conductivity using XPS. The conductivity changes were produced either electrochemically or chemically by a base/acid treatment. In both cases reversible effects on the N(1s) photoelectron spectrum were observed. (6 refs.)

120219 Cooper-minimum effects in the photoionization cross sections of 4*d* and 5*d* electrons in solid compounds. G.Rossi, I.Lindau (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA), L.Braicovich, I.Abbati.
Phys. Rev. B (USA), vol.28, no.6, p.3031-42 (15 Sept. 1983).
The authors present experimental determinations of the cross section for photoionization for 4*d* and 5*d* valence states in transition and noble metals and at the interfaces that these metals form with elemental semiconductors (group IV) in the photon-energy range $h\nu=70$-200 eV. A description of the technique used to obtain cross sections σ from photoemission measurements is provided, and a phenomenological discussion of the strong dependence of σ on the distortion of the initial-state *d* wave function in the solid environment with respect to the atomic case and in solid-state compounds with respect to pure metals is proposed. A strong reflection of the chemistry involving the *d* states on the photoionization probability is found, in particular, at the Cooper minimum. The use of photoemission at the Cooper minimum to study interfaces and compounds involving 4*d* and 5*d* states is discussed with the support of data relevant to commonly investigated systems, as well as an application to a less-studied refractory-metal-Si interface, namely, Mo/Si. (44 refs.)

120220 Characterization of thin Nb_3Sn diffusion layers on Nb (110): low-energy electron-diffraction and photoemission studies. R.J.Smith, A.Ghosh (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3043-8 (15 Sept. 1983).
The authors have carried out low-energy electron-diffraction and ultraviolet photoemission spectroscopy studies of the surface structures formed by annealing Sn overlayers deposited on Nb (110) substrates at room temperature. In addition to the usual ring patterns observed by electron diffraction, they observe a preferred azimuthal orientation with Nb_3Sn [100] parallel to Nb [111] in the surface plane. The photoemission results show three regimes of Sn coverage extending from submonolayer Sn structures to the limit of thick islands of Sn, the latter being a prerequisite to forming the *A*15, Nb_3Sn structure. The contribution of the Sn 4*p* states to the electronic structure is followed as a function of Sn coverage. The evolution of the photoemission spectra as a function of sample annealing shows the trend through the *A*15 structure to the relatively inert $p(1\times1)$ phase of Sn on Nb. (14 refs.)

120221 Investigation of the electronic band structure of gold by means of spin-polarized photoelectrons. G.Borstel, M.Wohlecke (Fachbereich Phys., Univ. Osnabruck, Osnabruck, Germany).
Phys. Rev. B (USA), vol.28, no.6, p.3153-9 (15 Sept. 1983).
The light-induced spin polarization of photoelectrons from Au (111) and Au (111)+K is calculated within a spin-dependent three-step model of photoemission. The comparison of experimental and theoretical data for several different values of the work function Φ shows that one may obtain a satisfactory agreement between theory and experiment for all Φ, if one assumes an upshift in energy by 1.1-1.5 eV for low-lying unoccupied relativistic augmented-plane-wave bands. (25 refs.)

120222 Spin-density calculations for core-electron photoemission and Auger electron line shapes, X-ray-edge exponents, and solid-state shifts. T.T.Rantala (Dept. of Phys., Univ. of Oulu, Oulu, Finland).
Phys. Rev. B (USA), vol.28, no.6, p.3182-92 (15 Sept. 1983).
Spin-polarized density-functional conduction-electron screening calculations for core ionization and Auger transition for elements Li, Be, Na, Mg, Al, and Ca are performed. The screening is described by conduction-electron scattering phase shifts obtained from selfconsistent-field ab initio calculations. Both spins are treated separately in order to study the spin-polarization effects. The core-electron states are resolved by a Hartree-Fock-Slater method, which makes it possible to apply the same local-density exchange and correlation approximation to all electrons, including the conduction electrons. X-ray-edge exponents and X-ray photoelectron (XPS) line singularity indices are extracted from the phase shifts. Auger line singularity indices are also evaluated. In the case of Na, Mg, and Al metals the results agree with those of the previous spin-symmetric calculations and experimental values. The screening of Li and Be is, however, strongly spin-polarized, which both increases the singularity index and decreases the edge exponents. This partly explains the broad *K* edge of Li. The spin-polarized method seems to be necessary to describe the peculiar conduction-electron response to the core hole in Ca. The screening in this case is localized in energy, totally spin polarized, and of *d*-electron type. This should cause very broad X-ray edges and the most asymmetric XPS and Auger lines. By performing the corresponding free-atom calculations with the same method, the solid-state shifts (extra-atomic energies) for the photoelectron energies (binding energies) and Auger electron energies are obtained. The density-functional results agree better with the experiments than the results of the excitonic model or excited-atom model, for example. In the case of Ca the shift values are exceptionally large due to the localized *d*-electron screening. (49 refs.)

120223 Vacancy effects in the X-ray photoelectron spectra of TiN_x. L.Porte (Lab. de Phys.-Chimie Minerale, Univ. de Lyon I, Villeurbanne, France), L.Roux, J.Hanus.
Phys. Rev. B (USA), vol.28, no.6, p.3214-24 (15 Sept. 1983).
The electronic structures of titanium nitrides TiN_x have been investigated by X-ray photoelectron spectroscopy over the entire composition range of the rocksalt structure ($0.5\lesssim x\lesssim1$). The valence-region spectrum of stoichiometric TiN is consistent with results of band-structure calculations. The filling of a

defect state at about 2-eV binding energy with decreasing x is explicitly demonstrated. Experimental results are compared with different models for calculation of the electronic structure of anion-deficient rocksalt transition-metal compounds. Variation of the core-level binding energies indicates a decrease of the ionicity in TiN_x with decreasing x. The Ti $2p$ satellite structure found for nearly stoichiometric samples is discussed in terms of screening of the core hole by the conduction electrons. (55 refs.)

120224 Photoelectron emission and reflection in dynamic scattering of an almost parallel X-ray beam. M.V.Kruglov, E.A.Sozontov, I.K.Solomin.
Sov. Phys.-Solid State (USA), vol.25, no.3, p.372-4 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.653-7 (March 1983). [received: Oct. 1983]
The angular dependences of photoelectron emission and reflection were measured and calculated for a low-divergence beam diffracted by strongly asymmetric monochromators. Use was made of K_a radiation emitted by Cu and V targets. A strong enhancement of the anomalous change in photoelectron emission was observed. An analysis was made of the influence of a small but finite beam divergence on the measurements. The calculated and experimental results were in satisfactory agreement with the reasons for the residual discrepancies between them were considered. A comparison was made of the relative usefulness of two- and three-crystal configurations in the determination of the angular dependences of photoelectron emission. (20 refs.)

120225 The influence of local perturbation on the electron density of sodium-tungsten bronzes. R.V.Vedrinskii, E.V.Vinnikov, S.A.Prosandeev, V.P.Sachenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1408-13 (Sept. 1983). In Russian.
Photoelectron spectra of 4f core shell of W in Na_xWO_3 bronzes have been studied by Green's function method. For the ReO_3 structure electron Green's function has been obtained and applied in calculations using the Slater-Koster formalism. Results show that interpretation of $4f$ PES of W in terms of 'shape-up' satellites is not correct. (11 refs.)

79.70 FIELD EMISSION AND FIELD IONIZATION

120226 Mechanism for explosive emission. A.M.Martsinovskii, V.G.Yur'ev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.565-6 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1312-16 (Nov. 1982). [received: Sept. 1983]
The rapid heating of a microscopic fine tip by a field-emission current results in the explosion of the tip and the formation of a cathode burst. As the metal converts into plasma, the emission of the cathode increases sharply (by one or two orders of magnitude); the process has accordingly come to be regarded as a particular type of emission: 'explosive electron emission'. Different opinions have been expressed regarding the nature of the electron emission from a fine tip into a cathode burst and regarding the kinetics of the evolution of this burst, but each interpretation runs into a difficulty of one sort or another in explaining the events which accompany explosive emission. The authors propose a new approach which they believe makes it possible to eliminate some of these difficulties. (17 refs.)

79.75 EXOELECTRON EMISSION

120227 Exoemission method for detection of an insulating layer on the surface of a ferroelectric. G.I.Rozenman, V.I.Pechorskii (Lenin Komsomol Ural Inst. of Timber Technol., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.25, no.3, p.510-11 (March 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.3, p.888-90 (March 1983). [received: Oct. 1983]
The authors have determined the density of the emission current j, the maximum electron energy ϵ_m, the angular distribution of electrons $j(\phi)$, the sign of the charge of the emitting surface, and the dependence of j on the field E generated by the pyroelectric or the piezoelectric effect. They studied single-domain $LiNbO_3$ single crystals. The integrated electron flux was determined using a secondary-electron multiplier. The value of ϵ_m was determined by the familiar method of absorption in thin foils. (8 refs.)

80.00 CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY

81.10B Growth from vapour

120229 Growth and characterization of n-WS_2 and niobium-doped p-WS_2 single crystals. J.Baglio, E.Kamieniecki, N.DeCola, C.Struck (GTE Labs. Inc., Waltham, MA, USA), J.Marzik, K.Dwight, A.Wold.
J. Solid State Chem. (USA), vol.49, no.2, p.166-79 (Sept. 1983).
Single crystals of n- and p-WS_2 were obtained by chemical vapor transport using chlorine and bromine as transporting agents. The best niobium-doped WS_2 crystals were obtained when the concentration of the charge (formulated $(1-x)WS_2.(x)NbS_2$) was $\simeq$37 mg charge/ml of tube, and $x=0.01$ to 0.03. A thermodynamic analysis of the crystal growth process is consistent with the observed doping concentration and other properties of the crystals obtained by this process. The crystals grown are characterized by electrical transport and surface photovoltage measured capacitance techniques. (22 refs.)

120230 Vapour phase growth of arsenic chalcogenide crystals and their characterization. B.Ghosh, G.P.Kothiyal (Tech. Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Prog. Cryst. Growth & Charact. (GB), vol.6, no.4, p.393-413 (1983).
The authors review the growth of arsenic chalcogenide crystals from vapour phase emphasizing the difficulties encountered for the growth of good quality crystals of suitable size. Structure of the grown crystals is mentioned briefly. Results of investigations on their optical, electrical and photoconductive properties is discussed and at times is compared with those of the glassy and amorphous materials for the sake of clarity. Future trends as regards the growth of mixed crystals and device fabrication is hinted at. (74 refs.)

81.10D Growth from solutions

120231 Interaction in the K_2O-Mn_2O_3-P_2H_2O system at 140-400°C. L.S.Guzeeva, A.V.Lavrov, I.V.Tananaev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1590-4 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1850 (Nov. 1982).
When manganese dioxide was heated with phosphoric acid and potassium carbonate (or nitrate) at 140-400°C, the following mixed condensed phosphates of trivalent manganese and potassium were obtained: $KMn(H_2P_2O_7)_2$, $KMnHP_3O_{10}$, $KMnHP_2O_7$; the cyclotriphosphate of divalent manganese $KMnP_3O_9$ was also obtained. The isolated compounds were characterized by chemical, X-ray crystallographic, IR-spectroscopic, and thermogravimetric methods. (4 refs.)

120232 Mixed crystals based on antimony niobate in the Sb_2O_3-Nb_2O_5-Sb_2O_5-KHF_2-H_2O_2-H_2O system. S.Yu.Stefanovich, V.I.Popolitov, A.V.Astaf'ev, F.Kh.Chibirova, S.I.Reiman, Yu.N.Venevtsev (L.Ya. Karpov Sci.-Res. Physicochem. Inst., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1607-12 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1869-74 (Nov. 1982).
The conditions of crystallization in the system Sb_2O_3-Nb_2O_5-Sb_2O_5-KHF_2-H_2O_2-H_2O were studied for various values of the redox potential. Mixed crystals of $SbNbO_4$-Sb^{5+} with the structure of ferroelectric antimony niobate were obtained, which must be regarded as solid solutions of substitution based on the phases $SbNbO_4$ and α-$SbSbO_4$. The composition of the specimens is represented by the equation $Sb(Sb_xNb_{1-x})O_4$, where x=0, 0.08, 0.14, 0.26. The dielectric properties of $Sb(Sb_xNb_{1-x})O_4$ crystals are characteristics of a ferroelectric and found to depend on the content of pentavalent antimony. (7 refs.)

120233 Effects of solvents and cell design for crystal growth of organic metals. H.Anzai, T.Moriya, K.Nozaki (Electrotech. Lab., Ibaraki, Japan), T.Ukachi, G.Saito.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1195-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Crystals of TTF- and TMTTF-TCNQ have been obtained by the diffusion method. The amount of the used reagents and the character of the used solvents have determined the size and shape of the crystals. Crystals of $(TMTTF)_2BF_4$ and $(TMTSF)_2ClO_4$ have been synthesized by the electrochemical method. Several types of the growing cell have been tested, and spectroscopic and chemical analysis for the crystal-growth mechanism have been presented. (3 refs.)

120234 Electrocrystallization of the complexes of tetrathiatetracene and synthesis of tetraselenaanthracene. T.Nogami, S.Ohnishi, H.Tanaka, H.Mikawa (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1253-6 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Electrocrystallization of 5,6,11,12-tetrathiatetracene gave several metallic conductive single crystals. A new donor molecule, 1,4,9,10-tetraselenaanthracene, was synthesized. (9 refs.)

120235 Quality of ADP crystals formed by rapid growth from a point-like seed. A.T.Amandosov, Z.S.Pashina, L.N.Rashkovich (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.271-2 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.469-70 (March 1983). [received: Oct. 1983]
A seed of $\sim 5 \times 5 \times 5$ mm dimensions was used to grow ADP crystals of $\sim 10 \times 10 \times 10$ cm size by crystallization from a solution at a rate 10-20 times higher than usual. The anomalous biaxiality of the crystals did not exceed $\sim 20'$, which was of the same order of magnitude as the value reported for good-quality crystals prepared by slow growth. A growth rate of ~ 1 cm/day should make it possible to prepare nonlinear crystals with large cross sections of the kind needed in laser thermonuclear fusion research. (2 refs.)

120236 An experiment of growing of crystals with optical transducer properties in gel and the investigation of those by X-ray method. Yu.E.Smirnov, G.A.Volkova, Yu.M.Smirnov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.115-16 (Aug. 1983). In Russian.
$C_4H_4CaO_6.4H_2O$, $NiSO_4.6H_2O$, $C_2H_4N_2H_4.H_2SO_4$ and $C_2H_4N_2H_4.2H_3PO_4$ crystals grown in gel were investigated by an X-ray method. Space group and lattice constants were determined for all crystals. (7 refs.)

81.10F Growth from melts

120237 Growth and investigation of $Ca_3(VO_4)_2$. O.K.Buznyakova, L.I.Ivleva, Yu.S.Kuz'minova, V.V.Osiko (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1612-15 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1875-8 (Nov. 1982).
Large, optically homogeneous monocrystals of calcium orthovanadate were obtained by the Czochralski method from the melt. The optical and dielectric characteristics, and the domain structure were investigated. (4 refs.)

120238 Substitution reactions in solvent-ferrite systems and acid-base properties of the components. L.M.Viting, A.F.Isaev (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1625-8 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1890-2 (Nov. 1982).
The acid-base properties of the components determine the nature of exchange processes in ionic melts. The acidity parameters of the solvent necessary for the synthesis of homogeneous single crystals of mixed ferrites were determined. (7 refs.)

120239 Computer controlled growth of GaP by LEC technique. S.Washizuka, J.Ushizawa, Y.Kokubun, M.Watanabe, T.Fukuda (Toshiba Res. & Dev. Center, Kawasaki, Japan).
Oyo Buturi (Japan), vol.52, no.6, p.515-21 (June 1983). In Japanese.
An automatic computer controlled LEC growth technique for GaP single crystal has been developed. Large diameter $\langle 111 \rangle$ and $\langle 100 \rangle$ oriented GaP crystals of up to 62 mm could be successfully grown by closed-loop control using crystal weighing. In the new automated technique, many growth parameters were measured during growth. The measurements were fed into the computer and processed in real time. The main responsibilities assumed by the computer are: (1) precise correction of weight signal, (2) calculation of phase advance, (3) addition of second differential signals on weight deviation to the diameter control loop, (4) optimum adjustment of growth parameters. (17 refs.)

120240 Crystal growth from melts of high viscosity. J.Liebertz (Inst. fur Kristallographie, Univ. zu Koln, Koln, Germany).
Prog. Cryst. Growth & Charact. (GB), vol.6, no.4, p.361-9 (1983).
The growing of large single crystals from glass forming melts is not so much a problem of principle, but rather a question of time and endurance, because of the small mobility of the atoms in such viscous melts. Therefore, the growth rates are unusually small resulting in extended growth periods. For the experimental procedure a top-seeding similar to the Czochralski or Nacken-Kyropoulos technique is most suitable. In consequence, such an experiment can be employed. The preparation of the seed crystals will be a difficult task needing several consecutive cycles of enlarging the grains, until a monocrystalline seed results. The compounds so far investigated are $Li_2B_4O_7$, PbB_4O_7, BaB_4O_7, $Bi_3B_5O_{12}$, BiB_3O_6, $LiBGeO_4$, Zn_3BPO_7, and $KMgP_3O_9$. In most cases crystals with optically clear parts of at least 1 cm^3 have been obtained. (29 refs.)

A new delafossite-type compound $CuYO_2$. I. Synthesis and characterization ....See Entry 118980

81.10H Zone melting and zone refining

120241 Stability of a vertical melt zone. N.E.Mokrousov, A.M.Pronin, D.A.Yas'kov (V.I. Ul'yanov Lenin Leningrad Electrical Engng. Inst., Leningrad, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1649-51 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1913-15 (Nov. 1982).
The crucibleless zone melting (CZM) technique occupies a key place in the technology of preparation of cubic single crystals of semiconductors. Its advantage over the crucible technique of single-crystal growing from melts is well known. A major drawback of the CZM technique is the limitation of the diameter of the ingot produced. The structural perfection of the crystal grown can be achieved by a flat crystallization front, for which the height of the melt zone should be close to the ingot diameter. A refined expression was derived for the maximum height of the stable melt zone. (6 refs.)

120242 Zone melting purification of alkali halides. V.Yu.Shishkin, V.S.Mityaev (Electrochem. Inst., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1653-4 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1917-18 (Nov. 1982).
All the alkali halides apart from NaF were examined. The grades of the salts were special-purity and chemically pure. The performance in the purification was checked by observing the molten zone during the process along with visual examination of the purified salts and measurement of the pH of the aqueous solution (samples were taken from the start, middle, and end of the boat). Observation of the molten zone showed that in all cases there were impurities insoluble in the liquid phase, which were transported fairly vigorously by convection currents as small clumps of black or white color. The insoluble particles concentrated in the liquid phase and accumulated at the end of the boat. After purification, the salt was a monolithic casting in the shape of the boat, most of which (about 4/5) was completely colorless and transparent with occasional cracks. (5 refs.)

81.15 METHODS OF THIN FILM DEPOSITION

(inc. epitaxial growth methods; see also 68.55 Thin film growth, structure, and epitaxy)

120243 One method of solving the coating problem. I.V.Serqienko, V.O.Roshchin.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.71-3 (1983). In Ukrainian.
A method is suggested for the exact solution of the problem of coating. Its convergence is established and results of a computer experiment presented. (2 refs.)

120244 Recent progress on LADA growth of HgCdTe and CdTe epitaxial layers. J.T.Cheung (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1604-7 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Laser assisted deposition (LADA) has been used to deposit eptiaxial $Hg_{0.7}Cd_{0.3}Te$ layers on CdTe substrates and CdTe layers on GaAs substrates. As-grown $Hg_{0.7}Cd_{0.3}Te$ layers are *n*-type and can be converted to *p*-type by annealing. Implanted n^+/p photodiodes have been demonstrated. Heteroepitaxial (111)CdTe/(110) GaAs layers were characterized by X-ray diffraction, UV reflectance, photoluminescence and transmission electron microscopy (TEM). Results indicate good crystallinity with 10^5 cm^{-2} dislocation densities beyond a few microns from the CdTe/GaAs interface. (9 refs.)

81.15C Deposition by cathodic sputtering

120245 The reactive sputtering of tantalum oxide: compositional uniformity, phases, and transport mechanisms. T.M.Reith (General Products Div., IBM Corp., Tucson, AZ, USA), P.J.Ficalora.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1362-9 (1983).
Reactive sputtering has been investigated by a number of workers, but no clear, generalized picture of the method or the phenomena involved has emerged. It is shown that the variation observed in the partial pressure of O_2 during both reactive and nonreactive Ta depositions is a sensitive measure of reactive surface activity in the plasma. A detailed examination of the O_2 behavior is made as the degree of activity of either target or substrate is systematically changed. A correlation is made between observed O_2 partial pressure variations and resulting compositional variations of the collected films using Auger electron spectroscopy, Auger sputter profiling, and transmission electron microscopy. Most importantly, the authors describe the reactive sputtering of Ta in O_2 in terms of two inverse reactions at two reactive surfaces; a dissociative reaction proceeds at the target while its inverse proceeds at the substrate. A generalized process in which a metal oxide dissociates to a less-stable suboxide at the target, transfers to the substrate as the suboxide, and recombines to form the original target compound, is suggested for the reactive sputtering of any metal oxide which exhibits preferential sputtering effects. (26 refs.)

120246 Transparent conducting zinc oxide and indium-tin oxide films prepared by modified reactive planar magnetron sputtering. S.Maniv, C.J.Miner, W.D.Westwood (Bell-Northern Res., Ottawa, Ontario, Canada).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1370-5 (1983).
Transparent conducting layers for liquid crystal displays and plastic substrates must be deposited without significant heating. A planar magnetron sputtering process which provides a suitable combination of resistivity and transparency on unheated substrates has been developed. Transparent conducting films of ZnO and indium tin oxide (ITO) have been deposited by sputtering Zn and $In_{0.9}Sn_{0.1}$ targets in a planar magnetron system modified to introduce oxygen near the substrate and to reduce the conductance for oxygen to the target. As the oxygen flow rate f_2 increased, the DC voltage V_a, required to maintain constant sputtering current, first increased and then decreased rapidly as the critical flow rate f_{2c}, at which the target oxidizes, is approached. In the ZnO case, V_a, had a maximum value of 525 V and was 355 V after the target oxidized; transparent conducting films were obtained at 435 V but the best films were obtained by activating an RF discharge close to the substrate to increase the oxidation rate. These polycrystalline films had a transmittance of 80% and a resistivity of 0.03 Ω cm but their chemical stability was too poor for useful application. In the ITO case, the RF discharge was necessary to obtain transparent conducting films. Even at $f_2/f_{2c}=0.94$, films were opaque

in the absence of this extra oxidation mechanism. Films with a transmittance of 79% and a resistivity of $1\times10^{-4}\Omega$ cm were obtained by coupling an RF power of 105 W to the substrate holder, with a substrate self-bias voltage less than 5 V, at $f_2/f_{2c}=0.77$. These films are amorphous and chemically stable. This sputtering process provides a maximum deposition rate of 48 nm/min on unheated substrates and is suitable for fabricating MIM-addressed liquid crystal displays. (17 refs.)

120247 Influence of the sputtering gas pressure on deposition profiles. G.Gonzalez-Diaz, I.Martil, F.Sanchez-Quesada, M.Rodriguez-Vidal (Dept. de Electricidad y Electronica, Facultad de Fisicas, Univ. Complutense, Madrid, Spain), A.Gras-Marti, J.A.Valles-Abarca.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1394-7 (1983).
Experimental thickness profiles of thin films deposited on substrates perpendicular to the target being sputtered show maxima whose position depends on the sputtering gas pressure. A simple model of particle slowing down in the transport stage accounts for this fact. The influence of diffusional transport on thin film profiles deposited on substrates both parallel and perpendicular to the target, can be estimated comparing experimental data with model predictions. (17 refs.)

120248 Radio-frequency sputtered indium tin oxide thin films. M.Russak, J.De Carlo (Res. & Dev. Center, Grumman Aerospace Corp., Bethpage, NY, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1563-4 (1983).
$In_{2-x}Sn_xO_{3-y}$ films are produced by RF sputtering. The films are heat treated in situ using the Ar sputtering plasma to heat the substrates. The structural properties are investigated by X-ray diffraction analysis. Electronic and optical properties are studied using measurements of resistivity, Hall coefficient, light transmission, and reflectivity. (19 refs.)

120249 Measurements of angular evaporation characteristics of sources. J.A.Dobrowolski, M.Ranger, R.L.Wilkinson (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1403-8 (1983).
An apparatus is described for the rapid and reliable measurement of the angular evaporation characteristics of sources. It consists of a moving and a stationary quartz crystal evaporation rate monitor, and it can be operated at any chosen azimuth angle. The instrument has been used to demonstrate the effect of source design, rate of evaporation, external obstructions, and evaporant material on the angular evaporation characteristic of high rate, high capacity evaporation sources. (23 refs.)

120250 Simple evaporator for refractory metal thin film deposition in ultrahigh vacuum. J.R.Waldrop, R.W.Grant (Rockwell Internat., Microelectronics Res. & Dev. Center, Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1553-4 (1983).
Describes a relatively simple, compact, and low cost evaporator for refractory metals based on electron bombardment heating of a thin refractory metal wire source. The evaporator is UHV compatible (operates in the 10^{-9} Torr range or below), has a stable evaporation rate, gives contamination-free thin film deposits, and needs no external cooling. The evaporation method is based on the observation that most refractory metals have relatively high vapor pressures at temperatures reasonably below the melting point. (5 refs.)

120251 Latest developments in the growth of $Cd_xHg_{1-x}Te$ and CdTe-HgTe superlattices by molecular beam epitaxy. J.P.Faurie, A.Million, R.Boch, J.L.Tissot (Lab. Infrarouge, Leti/Ceng, Grenoble, France).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1593-7 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The authors present here a general survey of their activity since 1981. They show that *n*- or *p*-type $Cd_xHg_{1-x}Te$ with low carrier concentration, high mobility and crystal perfection limited by the substrate itself can be grown by molecular beam epitaxy (MBE) between 180 and 210°C onto CdTe(111) and (100) orientation. They report for the first time the characteristics of a photovoltaic device processed on a *p*-type $Cd_xHg_{1-x}Te$ MBE layer which proves that this material can be grown by MBE with a detection device specification. They also give some information concerning 100 periods of 224 Å CdTe-HgTe superlattice previously reported. (9 refs.)

120252 Growth of low dislocation density CdTe films on hydroplaned CdTe substrates by molecular beam epitaxy. T.H.Myers, J.F.Schetzina (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA), T.J.Magee, R.D.Ormond.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1598-603 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
A systematic study of CdTe film growth by molecular beam epitaxy (MBE) on hydroplaned (111)A and (111)B CdTe substrates is discussed. Substrate preparation prior to growth involved chemical etching techniques, rather than sputtering in UHV, in order to maintain the integrity of the hydroplaned surface. A range of substrate temperature during growth was investigated. X-ray diffraction, UV reflection, and transmission electron diffraction measurements were employed to evaluate the structural quality of the CdTe films. Bright and dark field transmission electron microscopy was used to determine film dislocation densities. An entirely different film growth morphology was observed on the (111)A versus (111)B substrate surfaces for the range of temperatures and growth rate employed. Growth of high quality, low dislocation density, twin-free CdTe films was achieved on hydroplaned (111)A CdTe substrates at 250°C. (20 refs.)

81.15H Chemical vapour deposition

120253 CVD growth of silicon using higher-order silanes. D.C.Green, R.M.Plecenik, B.A.Scott, R.K.Tsui (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.918-20 (Aug. 1983).
In the growth of epitaxial silicon using chemical vapor deposition (CVD), reduced growth temperatures and/or higher growth rates can minimize autodoping, interface variations, and the resulting degradation of device performance. (no refs.)

120254 Low pressure CVD process for micro and polycrystalline silicon. J.M.Blum, D.C.Green, B.S.Meyerson, B.A.Scott (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.921-2 (Aug. 1983).
Micro and polycrystalline silicon thin films are prepared by low pressure chemical vapor deposition (LPCVD) processes in which the source gas is disilane (Si_2H_6). (no refs.)

120255 Simple method for preparing hydrogenated amorphous silicon films by chemical vapor deposition at atmospheric pressure. F.B.Ellis,Jr., R.G.Gordon (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.5381-4 (Sept. 1983).
An inexpensive one-step method is presented for fabricating hydrogenated amorphous silicon (*a*-Si:H) films with good photovoltaic properties using chemical vapor deposition (CVD) from a mixture of polysilanes, Si_nH_{2n+2}, in hydrogen at atmospheric pressure. This gas mixture is generated by a simple chemical reaction and used immediately in the CVD process. Thus, the highly flammable polysilanes need not be handled, distilled, stored, or transported. The conditions necessary for high (about 10%) hydrogen incorporation are explained. The method requires no expensive vacuum or electrical equipment and permits very high deposition rates (50-100 Å/s). It is shown that the growth rate of the film is determined by the gas-phase chemistry and not the surface chemistry. In addition, a new, safe, and economical technique for phosphorus doping is described. (13 refs.)

120256 Thermodynamic calculations for the chemical vapor deposition of silicon nitride. A.I.Kingon, L.J.Lutz, R.F.Davis (Dept. of Materials Engng., North Carolina State Univ., Raleigh, NC, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.551-8 (Aug. 1983).
The importance of silicon nitride (Si_3N_4) prepared by the chemical vapor deposition (CVD) technique is discussed briefly. A computer code was used to calculate CVD phase diagrams useful for the preparation of this material. Theoretical deposition efficiencies and gaseous phase compositions are also reported. The reactants include NH_3/SiH_4, NH_3/SiH_2Cl_2, $NH_3/SiCl_4$, and NH_3/SiF_4. The effect of N_2, H_2, and Ar additions, as well as the system pressure, are evaluated. The results are compared with experimental data from the literature. (73 refs.)

120257 Thermodynamic calculations for the chemical vapor deposition of silicon carbide. A.I.Kingon, L.J.Lutz, P.Liaw, R.F.Davis (Dept. of Materials Engng., North Carolina State Univ., Raleigh, NC, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.558-66 (Aug. 1983).
A computer code, SOLGASMIX-PV, was used to calculate CVD phase diagrams useful for the preparation of silicon carbide from commonly used precursors. The results show that in order to prepare single-phase β-SiC it is necessary to closely control thermodynamic parameters such as pressure, temperature, and the concentrations of the precursor and carrier gases. The system Si-C-H is substantially different from that of Si-C-H-Cl, the latter being more complex, with single-phase β-SiC occurring under conditions very different from those of the former. The calculated CVD phase diagrams are compared with calculated and experimental data from the literature. The fundamental importance of a thermodynamic equilibrium description of the CVD system is emphasized. (34 refs.)

120258 High-purity InP grown by hydride VPE technique with impurity gettering by indium source and oxygen. A.Usui, H.Watanabe (Fundamental Res. Labs., NEC Corp., Kawasaki, Japan).
J. Electron. Mater. (USA), vol.12, no.5, p.891-902 (Sept. 1983).
Purification methods for vapor-grown InP layers have been investigated for the hydride ($In/HCl/PH_3/H_2$) process. The carrier concentration of non-doped InP layers was found to be decreased with a commensurate increase in mobility by increasing the indium source temperature and by introducing a small amount (a few p.p.m.) of oxygen into the growth region. At 910°C of In source temperature with 1.2 p.p.m. oxygen, a 77K mobility as high as 40000 cm^2/v.sec (3480 cm^2/v.sec at 300K) with a carrier concentration as low as 5×10^{14} cm^{-3} (8×10^{14} cm^{-3} at 300K) was obtained. Photoluminescence efficiency was also found to be improved by the above-mentioned two methods. Mass spectroscopy analysis of used In metal showed a few p.p.m. impurity contamination, such as Sn, Fe and Cu, which were hardly detected in raw 6′9-purity In metal before the growth experiment. These results indicate that the In source has a gettering effect for impurities in input gases, mainly HCl from a cylinder, and the effect was enhanced by increasing the In source temperature. The oxygen may play a role in the conversion to non-volatile oxides of residual impurities and hence a reduction in the impurity incorporation. (10 refs.)

120259 Thin film studies of oxides by the organometallic-CVD technique. H.Prakash (Inorganic Chem. Div., Nat. Chem. Lab., Poona, India).
Prog. Cryst. Growth & Charact. (GB), vol.6, no.4, p.371-91 (1983).
The organometallic-CVD technique is reviewed for the growth of thin films of binary oxides, for example, of SiO_2, GeO_2, SnO_2, TiO_2, ZrO_2, HfO_2, Al_2O_3, Ta_2O_5, Nb_2O_5, Fe_2O_3 and ZnO. Growth methods, film characterizations, film properties and their potential device applications are reported. (61 refs.)

120260 A linear analysis of chemical vapour deposition processes for micro-electronics applications. I. Diffusive gas transport. H.Arnold.
Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.117-24 (1983). In German.
Analyses vapour diffusion doping methods for the production of silicon semiconductor devices, and models the deposition system as a resistance network, with reference to thermal diffusion effects. (10 refs.) *G.M.E.*

120261 A linear analysis of chemical vapour deposition processes for micro-electronics applications. II. Surface effects. H.Arnold.
Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.125-32 (1983). In German.
For pt.I see ibid., vol.29, no.3, p.117 (1983). A linear analysis is proposed for thermodynamic dissociation effects for various diffusion current densities. This is applied to hydrides SiH_r where r is between 1 and 4. The problems of simultaneous parallel reactions are mentioned and conclusions are drawn on

the applicability of linear models for current density, with special reference to hydride processes using a hydrogen carrier. Finally, nonlinear effects in chloride processes are considered. (11 refs.) *G.M.E.*

120262 A deposition aid for matrix isolation studies. W.E.Klotzbucher (Max Planck Inst. fur Strahlenchem., Mulheim a.d. Ruhr, Germany).
Cryogenics (GB), vol.23, no.10, p.554-6 (Oct. 1983).
An alternative to the usual matrix isolation deposition technique has been developed whereby the deposition rate of any material can be established by using a quartz crystal microbalance incorporated into the cryogenic sample holder. (15 refs.)

120263 Heavily boron doped crystalline silicon films by plasma technique. Y.Yoshida, Y.Onuma (Dept. of Electrical Engng., Shinshu Univ., Nagano, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1222 (July 1983).
Plasma decomposition was performed in a horizontal quartz tube with an inner diameter of 38 mm at various substrate temperatures from 450°C to 650°C. X-ray diffractometer scans and RHEED patterns of (a) undoped and (b) heavily boron doped silicon films about 10 μm thick deposited at the various substrate temperatures are shown. Heavy boron doping causes the growth of crystallites with preferred orientation, possibly due to catalysis by boron. (4 refs.)

120264 Importance of chain reactions in the plasma deposition of hydrogenated amorphous silicon. I.Haller (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1376-82 (1983).
Insight on the deposition mechanism of hydrogenated amorphous silicon (*a*-Si:H) can be gained by inspecting the consumption rates of SiH_4 by various species in the plasma since essentially all the silicon in the silane consumed is incorporated in the solid. Chemical chain reactions eliminating H_2 are thermodynamically allowed as the replacement of two Si-H bonds with H-H and Si-Si bonds is thermoneutral or exothermic. In the case where the chain carriers are positive ions, the chain reaction is known to proceed at collisional rates. The relative rate of SiH_4 removal by electron impact induced fragmentation can be estimated for various plasma conditions by making appropriate assumptions for the distribution function, mean electron energy, and fragmentation cross section. It is found that under most conditions used for the deposition of *a*-Si-H, the species arising from chain reactions are more important in silicon transport than fragments directly formed in electron impact. (40 refs.)

120265 Process for depositing thin, continuous metal films. E.I.Alessandrini, C.R.Guarnieri (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.925-6 (Aug. 1983).
Using alow energy, low intensity argon ion beam to bombard (1) the substrate before deposition and (2) the growing film during deposition, it has been possible to deposit continuous gold films at a thickness of 5.6 nm. (no refs.)

81.15L Deposition from liquid phases (melts and solutions)

120266 Horizontal slider LPE of (HgCd)Te. R.A.Wood, R.J.Hager (Honeywell Corporate Technol. Center, Bloomington, MN, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1608-11 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The authors report the epitaxial growth of single and double layers of $Hg_{1-x}Cd_xTe$ on 2×3 cm single-crystal CdTe substrates, using liquid phase epitaxy (LPE) from tellurium solution in an atmospheric pressure horizontal slider apparatus. The layers are found to be extremely uniform in composition (x) across individual layer areas and in layer-to-layer reproducibility (standard deviation 0.002). They report their observations of the morphological, compositional and crystalline quality of the layers, and measurements of the electrical parameters of the layers. (9 refs.)

120267 Surface controlled crystallization of poly(tetramethylene terephthalate). H.Ghavamikia, S.E.Rickert (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).
J. Mater. Sci. (GB), vol.18, no.10, p.2969-75 (Oct. 1983).
Epitaxial crystallization of poly(tetramethylene terephthalate) from dimethyl phthalate solution on alkali halide crystals has been studied using electron microscopy and electron diffraction techniques. Rod-like crystals oriented in the ⟨110⟩ directions of the substrate were found to form at short crystallization times. At longer times, however, lamella-like crystals, which were nucleated at the sides of the rod-like crystals, grew in directions dictated by the substrate. Besides the normal bidirectional orientations induced by the substrate, the polymer crystals showed twinning which was found to be due to the triclinic lattice structure of the polymer. (12 refs.)

120268 A process for producing micropattern by electroless nickel plating. S.Mizushima (Dept. of Mech. Engng., Nat. Defense, Acad., Yokosuka, Japan), Y.Kimura.
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.4, p.335-42 (Dec. 1982). In Japanese. [received: Sept. 1983]
An electroless nickel deposit on glass has been studied for use as a micropattern. For this purpose, metal to glass adhesion and the surface smoothness are substantially important. The good adhesion strength between the glass and the deposited nickel is obtained by immersing the glass in a conventional chromic-sulfuric acid etching solution and by treating with sodium hydroxide solution. A high-level nickel deposit was also obtained by using sodium citrate or ammonium citrate as a condition complexing agent in the electroless nickel bath. The optimum etching composition and operation for the production of micropatterns were found to be 8% HNO_3–70% H_3PO_4–22% H_2O, at 25°C for an etching time of 5-7 min. (9 refs.)

120269 Material transfer with vertical electrodes. P.Kutzschbach, H.Liebscher (Tech. Hochschule Ilmenau, Ilmenau, Germany).
Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.85-94 (1983). In German.
Describes experiments on the effects of diffusion, migration and convection on the rate of material transfer in electroplating. Diffusion limits are calculated, and work with injection of argon gas jets, and with rotating electrodes, is outlined. It is shown that material transfer increases with rotation rate up to 6000 revolutions per minute. The base electrode was made of titanium, the electrolyte was ammonium iron sulphate and a lead anode was used. (3 refs.) *G.M.E.*

81.20G Specific metals and alloys (compacts, pseudoalloys)

120271 Preparation of metallic glass ribbons from the pure elements. V.Madurga, E.Ascasibar, J.M.Gonzalez, M.Morala (Lab. Magnetismo, Univ. Complutense, Madrid, Spain), A.Garcia-Escorial, J.A.Peces, O.V.Nielsen.
An. Fis. Ser. B (Spain), vol.79, no.2, p.82-4 (May-Aug. 1983). [received: Oct. 1983]
The authors describe a successful attempt to prepare metallic glass ribbons starting from the pure elements. The composition chosen was

$(Fe_{.05}Co_{.95})_{75}Si_{15}B_{10}$, which is a ferromagnetic material with near-zero magnetostriction. (3 refs.)

120272 Sintering of submicron tungsten-based heavy alloys. V.Srikanth, G.S.Upadhyaya (Indian Inst. of Technol., Kanpur, India).
Int. J. Refract. & Hard Met. (GB), vol.2, no.3, p.121-8 (Sept. 1983).
The densification behaviour of submicron tungsten powder compacts containing 10 weight percent Cu-Ni binders in different proportions was studied. The effect of copper powder size on the sintering behaviour was investigated. (8 refs.)

120273 The use of metallic glasses in fabrication of ICF targets. W.L.Johnson (Keck Lab. of Engng., California Inst. of Technol., Pasadena, CA, USA), M.C.Lee.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1568-70 (1983).
The fabrication of Au-base metallic glass spheres and microballoons used for ICF targets is described. Alloys of composition $Au_{55}Pb_{22.5}Sb_{22.5}$ were used because of its low melting point and high Z number. Metallic glass microspheres have a high degree of sphericity and surface smoothness and deform homogeneously and isotropically under the high strain rates involved in an ICF implosion. (5 refs.)

120274 The effect of fluoride preparation on the purity of the rare earth metals. B.J.Beaudry, P.E.Palmer, K.A.Gschneidner,Jr. (Dept. of Materials Sci. & Engng., Iowa State Univ., Ames, IA, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.277 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given, as follows. The established process used at the Ames Laboratory to prepare the rare earth metals includes the calcium reduction of high purity rare earth fluorides. The preparation of these high purity fluorides in the past has included melting of the fluorides under a dynamic HF-Ar atmosphere to remove the oxygen quantitatively (the resultant compounds are known as 'topped' fluorides). The present research indicates that this melting step is not necessary to prepare fluorides of sufficiently high purity for metal preparation, especially for the light rare earth metals. As an example, the typical oxygen contents of lanthanum, cerium, praseodymium and neodymium prepared from topped fluoride are 34 wt.ppm, 57 wt.ppm, 29 wt.ppm and 40 wt.ppm respectively, while the oxygen contents of the corresponding lanthanides prepared from untopped fluorides are 28 wt.ppm, 59 wt.ppm, 30 wt.ppm and 55 wt.ppm respectively.

120275 Effect of electrolysis time on the magnetic properties of fine iron powders. L.Yu.Ivanova, B.M.Machul'skii, E.P.Zhelibo, A.I.Alekseenko (Inst. of Colloid Chem. & Chem. of Water., Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.79-83 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.6-11 (Feb. 1983). [received: Sept. 1983]
It was found that an organic layer of 0.5% solution of oleic acid in toluene (layer thickness 1.5×10^{-2} m, ratio between the electrolyte and organic layer volumes 5:1) enabled the electrolytic bath to operate for 4 h without correction of the composition of its organic layer. During periods longer than 4 h trivalent iron oleates extracted in the course of electrolysis from the powder surface into the toluene solution built up in the upper, organic layer of the bath. Iron oleates, which are not readily adsorbed on the electrode surface, reduced the true current density and lead to the formation of powders of low coercive force. Apart from this, they did not passivate the powder and they decreased its magnetic induction. (6 refs.)

120276 Conditions of formation, structure, and magnetic properties of finely divided iron produced in the presence of ED-20 epoxide oligomer and oleic acid. T.N.Amelichkina, E.P.Zhelibo, V.V.Myalkovskii, T.M.Shvets (Inst. of Colloid Chem. & Chem. of Water, Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.84-9 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.11-17 (Feb. 1983). [received: Sept. 1983]
The authors studied the effect of $FeCl_2.4H_2O$ concentration, pH, and current density on the electrodeposition, structure, and magnetic properties of v/f iron powders produced in a bath with an organic layer containing ED-20 epoxide oligomer and a HFA (oleic acid). They conclude that to obtain powders of satisfactory magnetic properties at high current efficiency in the presence of an oligomer and a HFA, it is necessary to employ low-concentration salts of the metals to be deposited (not more than 50 g/liter) and moderately acid solutions, the current density should lie in the range 9-18 A/dm^2. (9 refs.)

120277 Sintering of tungsten-nickel-iron alloy powders. N.A.Kuz'min, V.P.Matsokin, E.M.Rabinovich (Kharkov State Univ., Kharkov, Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.105-9 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.35-40 (Feb. 1983). [received: Sept. 1983]
The sintering kinetics of three-component W-Ni-Te alloy powders and powder mixtures were studied as a function of heating conditions, composition, powder particle size, and starting compact porosity. The growing shrinkage of compacts produced at $p \simeq 6 \times 10^2$ Pa was measured continually in a high-temperature differential dilatometer with an accuracy $\Delta\epsilon \simeq \pm 10^{-4}$. The main dilatometric experiments were carried out at a constant heating rate ω ($10^{-1} \leq \omega \leq 1$ deg C/sec), with some experiments being conducted under isothermal conditions. Porosities were determined by hydrostatic weighing with an error $\Delta/\vartheta \sim 10^{-3}$. (9 refs.)

120278 Structure formation in magnetoabrasive materials from iron-carbon melts alloyed with carbide-forming elements. V.E.Oliker, A.F.Zhornyak, V.Ya.Shlyuko, T.Ya.Gridasova, L.A.Karpova (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.142-9 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.76-84 (Feb. 1983). [received: Sept. 1983]
It is concluded that the particles of an atomized magnetoabrasive powder from any given alloyed melt have structures differing in macromorphology, which is a result of differences in conditions of solidification of metal drops during melt disintegration. In the presence of carbide-forming elements silicon in an iron-carbon melt dissolves mainly in ferrite, without significantly affecting the morphology of structure of the atomized particles. The effectiveness of magnetoabrasive machining (polishing) depends to a large extent on the choice of abrasive and work materials. (22 refs.)

81.20J Dispersion-,fibre-, and platelet-reinforced metal-based composites

120279 Development of a new hybrid material (ARALL) for aircraft structure. L.B.Vogelesang (Dept. of Aerospace Engng., Delft Univ. of Technol., Delft, Netherlands).
Ind. & Eng. Chem., Prod. Res. & Dev. (USA), vol.22, no.3, p.492-6 (Sept. 1983).
A new material for aircraft structures with several promising properties is described. The material is obtained by the adhesive bonding of a number of thin aluminum alloy sheets and aramid layers to produce an aramid reinforced aluminum laminate (ARALL). ARALL shows very favorable fatigue crack growth properties and has a high tensile yield strength. This is especially true if suitable residual stresses are introduced into a laminate with an optimum thickness of metal sheets. In spite of the use of structural fibers in the laminates, nearly all advantages of metals over pure composites are preserved such as plasticity, impact strength, formability, and easy machining. (7 refs.)

120280 Applicability of potassium titanate fiber to metal matrix composites. H.Fukunaga, K.Gohda (Dept. of Mech. Engng., Faculty of Engng., Saijo, Japan), N.Ohta.
Trans. Jpn. Inst. Met. (Japan), vol.24, no.9, p.642-9 (Sept. 1983).
Deals with the reaction of the potassium titanate fiber on four kinds of pure metals (aluminum, nickel, titanium and copper) in air and vacuum at elevated temperatures, in order to find the applicability of the fiber to MMC. The fiber does not react on the aluminum matrix up to the melting point of the matrix. Beyond the point, however, it is found by EPMA line analysis that potassium in the fiber disappears. Up to 1123K, there is no detectable reaction between the fiber and the nickel matrix. The fiber does not react in vacuum on both titanium and copper matrices below the melting point of them, while a violent reaction between the fiber and the matrices occurs in the atmosphere at temperatures higher than 1023K. The above mentioned results suggest that the potassium titanate fiber can be applied as a reinforcement in the aluminum and nickel matrices when the MMC is fabricated in air, as well as in the titanium and copper matrices when fabricated in vacuum. (30 refs.)

81.20L Ceramics and refractories

120281 A dense ceramic based on gadolinium-gallium garnet. O.V.Gorshkova, E.S.Lukin (Chem. Technol. Inst., USSR).
Glass & Ceram. (USA), vol.39, no.11-12, p.609-12 (Nov.-Dec. 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.12, p.18-19 (Dec. 1982). [received: Sept. 1983]
Presents the results of investigations on the technological conditions for obtaining a high-density polycrystalline GGG-based ceramic from a homogeneous charge prepared by calcining amorphous powders of coprecipitated gallium and gadolinium hydroxides from high-concentration solutions of chloride salts. The studies showed that milling (grinding) of the powders of coprecipitated hydroxides before and after synthesis at 1000°C significantly improves the sintering process. Based on GGG, a ceramic with 97.7% relative density was obtained with almost zero open porosity (0.2%), 17% linear shrinkage, 2% intracrystalline porosity, and a grain size of 20-35 μm. (3 refs.)

120282 Synthesis reaction of metatitanate $BaTiO_3$. I. Effect of the gaseous atmosphere upon the thermal evolution of the system $BaCO_3\text{-}TiO_2$. A.Beauger, J.C.Mutin, J.C.Niepce (Lab. de Recherches sur la Reactivite des Solides, CNRS, Dijon, France).
J. Mater. Sci. (GB), vol.18, no.10, p.3041-6 (Oct. 1983).
Thermogravimetric and X-ray diffraction analysis of the reaction mixture, during the synthesis of barium metatitanate $BaTiO_3$ from $BaCO_3$ and TiO_2 allowed clarification of the transformation time and the role of the reaction environment: in air, the occurrence of $BaTiO_3$ is in competition with that of orthotitanate Ba_2TiO_4. The latter forms between 25 and 95% of the transformation of the initial mixture by reaction between $BaCO_3$ and $BaTiO_3$. Under vacuum, metatitanate is not detected before 70% of transformation of the initial mixture. The orthotitanate occurs alone, oxide BaO produced by the decomposition of the carbonate and replaces it in the reaction syntheses. In CO_2, the synthesis of $BaTiO_3$ competes with the formation of a phase other than Ba_2TiO_4 but whose behaviour during calcination is comparable to that of the orthotitanate. (12 refs.)

120283 Formation mechanism of cBN crystals under isothermal conditions in the system $BN\text{-}Ca_3B_2N_4$. T.Sato, T.Endo, S.Kashima, O.Fukunaga, M.Iwata (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
J. Mater. Sci. (GB), vol.18, no.10, p.3054-62 (Oct. 1983).
Cubic BN was synthesized by treating hexagonal BN(hBN) in the presence of $Ca_3B_2N_4$ which acted as a flux for BN. After the high pressure and temperature treatments, cBN was obtained in a part of hBN layer initially charged, but hardly in the flux layer. The grains of cBN were precipitated accompanied with the advance of $Ca_3B_2N_4$ flux into hBN zone. From these observations, it can be deduced that hBN dissociated beneath the thin layer of flux advanced, and crystallized as cBN under an isothermal condition. In this system, the mechanism was basically the same as that of the diamond growth in the metal flux such as nickel and cobalt. Namely, the crystal growth of cBN was governed by the difference of solubility between hBN and cBN in a melted $Ca_3B_2N_4$, because of the eutectic relation between BN and $Ca_3B_2N_4$. For the nucleation process, two types of features were observed; one was the preferential nucleation at the boundary of hBN-flux, and the other was the homogeneous nucleation in the part of hBN layer initially charged. (8 refs.)

120284 Preparation of $Bi_4Ti_3O_{12}$ powders in the presence of molten salt containing LiCl. T.Kimura, T.Kanazawa, T.Yamaguchi (Faculty of Sci. & Technol., Keio Univ., Yokohama, Japan).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.597-600 (Aug. 1983).
The reaction between Bi_2O_3 and TiO_2 in molten LiCl-KCl was examined with special emphasis on the reaction mechanism and the size of $Bi_4Ti_3O_{12}$ particles. The oxides reacted with LiCl to form an intermediate compound, which changed into $Bi_4Ti_3O_{12}$ on extended heating. Potassium chloride retarded the reaction between the oxides and LiCl and promoted the change from the intermediate compound to $Bi_4Ti_3O_{12}$. $Bi_4Ti_3O_{12}$ particles prepared in the flux were platelike, irrespective of the preparation conditions, but their

size depended on reaction temperature and time, the ratio of LiCl to KCl, and the amount of flux. (12 refs.)

120285 Diffusional reaction-bonding of Si_3N_4 ceramics under high pressure. T.Kaba, M.Shimada, M.Koizumi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.135-6 (Aug. 1983).
Diffusional reaction-bonding of Si_3N_4 ceramics was accomplished by maintaining samples at 3.0 GPa and 1800°C for 1 h. Interfaces of bonded samples were examined by scanning electron microscopy, Vickers microhardness measurements, and electron probe microanalysis. These results indicate that strong bonding between sintered ceramic bodies is achieved by a diffusional reaction at high temperature and pressure. (13 refs.)

120286 Mechanisms of densification during the hot pressing of calcium oxide and synthetic doloma. I.B.Bashir (Dept. of Ceramics, Univ. of Leeds, Leeds, England).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.51-7 (Oct. 1983).
The behaviour of calcium oxide and synthetic doloma during hot pressing was studied. Between 5 and 30 MPa, and at 1380°C, the kinetics of hot pressing were elucidated using grain sizes ranging from 9 to 28 μm. The data obtained were interpreted in terms of transitional behaviour between a lattice diffusion mechanism (Nabarro-Herring creep) at low stresses (i.e. 5-15 MPa) and a dislocation creep mechanism at high stresses (i.e. 15-30 MPa). The mixed mechanism observed was consequently discussed in terms of deformation maps for calcium oxide and doloma. (18 refs.)

120287 Low temperature sintering of TiO_2. M.F.Yan, W.W.Rhodes (Bell Labs., Murray Hill, NJ, USA).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.59-66 (Oct. 1983).
Low temperature sintering was achieved in ultrafine, well-dispersed and uniformly packed TiO_2 powder compacts. TiO_2 powder was prepared by hydrolysis of titanium isopropoxide, calcination at 550°C and dispersion in an aqueous solution with a controlled pH value. A sedimentation process was used to remove any coarse agglomerates in the well-dispersed TiO_2 slurry. The finest particles remaining in suspension were concentrated into uniform compacts by a centrifuge technique. Whereas commercial TiO_2 powder required sintering above 1230°C tc achieve a density which is 96% of the theoretical density the prepared powder could be sintered to greater than 99% of the theoretical density at 840°C. (15 refs.)

120288 Effects of Cr_2O_3 additions on the sintering and mechanical properties of Al_2O_3. H.Tomaszewski (Inst. for Technol. of Elektronic Materials, Warsaw, Poland).
Szklo & Ceram. (Poland), vol.34, no.1, p.1-5 (Jan.-Feb. 1983). [received: Oct. 1983]
The effect of the Cr_2O_3 additions on the penetration of the intergranular phase between alumina grains of 96 wt.% alumina ceramics, by applying the principles of quantitative metallography to the observed microstructures, has been investigated. From the microsections values of the true dihedral angle have been measured. The effect of Cr_2O_3 was significant to increase the dihedral angle and to decrease the alumina ceramics density. As a result of this effect distinct deterioration of mechanical properties of alumina ceramics was observed. (14 refs.)

120289 Effect of nature and chemical structure of water-soluble polymers on structure formation in the ferrite powder-water system and its properties. P.I.Kuprienko, G.S.Pop, N.N.Kruglitskii, A.F.Pashkov, T.V.Slovikovskii, V.E.Soltyk (Inst. of Colloid Chem. & Chemistry of Water, Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.94-8 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.22-8 (Feb. 1983). [received: Sept. 1983]
The effect of nature and concentration of some water-soluble polymers (WSPs) on the rheology of their solutions and aqueous suspensions of ferrite powders, structure formation in ferrite pastes, and properties of finished parts was investigated. Results demonstrate the feasibility of regulating the processes of structure formation in and the properties of ferrite suspensions by means of water-soluble polymers of various natures and chemical structures. A styrene copolymer with an ammoniacal salt of maleic acid with a degree of ionization of 1.0 (SCASMA-1) may be recommended as a binding plasticizer for manganese-zinc ferrite pressing powders. (7 refs.)

120290 Cold pressing of wurtzite boron nitride powders under high pressures. S.S.Dzhamarov, N.I.Shcherban' (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.102-4 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.32-4 (Feb. 1983). [received: Sept. 1983]
A study was made of the compressibility of wurtzite boron nitride powders containing various amounts of graphitelike boron nitride. For all the powders investigated the relationship between compact density and pressing pressure was found to be of the same type. It is shown that the densification of wurtzite boron nitride powders and, apparently, other powdered superhard materials under conditions of high pressures can be described by logarithmic or power expressions. The physical meaning of the constants of the powder pressing equations is explained. Pressures necessary for attaining some given structures and densities in the pressing of powdered superhard materials are estimated. (7 refs.)

81.20N Cermets, ceramic and refractory composites

120291 Sintering of tin oxide ceramic with additives. T.E.Os'kina, K.B.Zaborenko, I.G.Mel'nikova, T.I.Pron'kina (Moscow State Univ., Moscow, USSR).
Glass & Ceram. (USA), vol.39, no.11-12, p.617-20 (Nov.-Dec. 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.12, p.21-2 (Dec. 1982). [received: Sept. 1983]
It was found that sintering of the systems based on SnO_2 with ZnO and Nb_2O_5 additions was determined not only by the formation of solid solutions but also, to a considerable extent, by the mutual interaction of the additives resulting in the formation of chemical compounds or eutectics. This is why maximum density was achieved when SnO and Nb_2O_5 additives were introduced with a mass content close to the eutectic composition in the phase diagram. Such a composition of the system should be regarded as optimum for decreasing the sintering temperature and obtaining a ceramic with higher density. (5 refs.)

120292 Thermostable material from fluorophlogopite and an organosilicon binder. E.Z.Asnovich, V.A.Kolganova (All-Union Sci.-Res. & Technol. Planning Inst. of Insulating Materials & Foil Dielectrics, USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1508-12 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1755-8 (Oct. 1982). [received: Sept. 1983]
A new inorganic material, SFK mica sheet, was obtained from fluorophlogopite paper, and an organosilicon binder. Its chemical composition and physicochemical and electrical properties were studied by heating to 850°C. It was found that the material exhibits high thermostability. (3 refs.)

120293 Microstructure of sintered mullite-zirconia composites. S.Prochazka, J.S.Wallace, N.Claussen (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.125-7 (Aug. 1983).
Fused mullite, pure and with 10 to 25 vol.% ZrO_2 added, was milled in an attritor and sintered in air at temperatures near 1600°C to a dense fine-grained ceramic. The ZrO_2 promoted densification and retarded grain growth of the mullite phase. Transmission electron microscopy showed that compositions containing ZrO_2 were substantially free of glass, whereas pure mullite bodies contained a glassy phase. The ZrO_2 formed intergranular, isolated particles. (17 refs.)

120294 Detection of thin intergranular cobalt layers in WC-Co composites by lattice imaging. V.Jayaram, R.Sinclair (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.137-9 (Aug. 1983).
Much discussion has taken place concerning the contiguity of the carbide phase in sintered WC-Co composites. The lattice fringe imaging technique was used to demonstrate that WC grains which appear macroscopically contiguous are sometimes truly so at the atomic level. In other instances, they are separated by films of cobalt $\approx$1 nm thick. (5 refs.)

81.20P Glasses

120295 Preparation of titania-silica glasses by the gel method. T.Hayashi, T.Yamada, H.Saito (Dept. of Appl. Chem., Nagoya Univ., Nagoya, Japan).
J. Mater. Sci. (GB), vol.18, no.10, p.3137-42 (Oct. 1983).
A series of bulk glasses in the TiO_2-SiO_2 system have been prepared by hydrolysing the mixture solution of $Ti(OC_3H_7)_4$ and $Si(=OC_2H_5)_4$ with water and hydrochloric acid, and slowly heating the resultant gels up to 800°C. The conversion of gels to glasses was examined by the measurements of Vickers hardness, IR and TGA. The properties of TiO_2-SiO_2 glasses in the less than 12.9 wt.% TiO_2 range obtained by the gel method were very similar to those of oxide glasses made by the flame hydrolysis process. These glasses showed ultra-low thermal expansion, but the precipitation of anatase remarkably increased the thermal expansion. In the less than 10.4 wt.% TiO_2 range, the glasses obtained by heating up to 800°C were not crystallized at 1000°C or higher, while in the more than 20 wt.% TiO_2 range anatase was precipitated at 900°C. It was found that glasses obtained by the gel method were a true solid solution at least up to 7.4 wt.% TiO_2 composition. (9 refs.)

120296 Computer calculations of optimum glass compositions. B.Ziemba, M.Olkusnik, W.Ziemba, E.Kowalska, K.Manczak.
Szklo & Ceram. (Poland), vol.34, no.4, p.127-31 (July-Aug. 1983). In Polish.
The mathematical models have been elaborated of the relations between the chemical composition of a glass and the 28 parameters describing the properties of this glass. The composition selected were of 74 glasses in the system SiO_2-Al_2O_2-CaO-MgO-Na_2O-K_2O: additionally literature data for 14 more glasses were used for the purposes of glass optimisation. For each of the glasses optimum decisions and limiting conditions of the optimisation have been formulated, and the programs written for ODRA-1305 in FORTRAN 1900. (14 refs.)

Reinforcing laminates with the glass fibers ....See Entry 120305

81.20S Polymers

120297 Soluble polyacetylene. G.L.Baker, F.S.Bates (Bell Labs., Murray Hill, NJ, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.11-16 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Soluble block copolymers containing polyacetylene have been prepared in which the polyacetylene segment is isolated in solution. The characterization of this material by infrared, visible, and NMR spectroscopy is described. (10 refs.)

120298 Formation of highly conducting derivatives of polyacetylene through oxidation with selected metal halides. D.Billaud (Lab. de Chimie du Solide Mineral, Univ. de Nancy I, Nancy, France), I.Kulszewicz, A.Pron, P.Bernier, S.Lefrant.
J. Phys. Colloq. (France), vol.44, no.C-3, p.33-5 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Some new metal halides ($InCl_3$, InI_3, $TiCl_4$, TiI_4, $SnCl_4$, $ZrCl_4$) can oxidize polyacetylene with the formation of highly conducting polymers characterized by elemental analysis, mass uptake and physical methods. Electrical conductivities and EPR spectra are in agreement with the metallic behaviour of these new materials. (7 refs.)

120299 Designed synthesis of novel one-dimensional materials with pseudo-$(SN)_x$ bundle-structure. M.Megnamisi-Belombe (Dept. of Chem., Univ. of Ife, Ile-Ife, Nigeria).
J. Phys. Colloq. (France), vol.44, no.C-3, p.717-21 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The aim is to synthesize new one-dimensional materials in which suitable metal complexes crystallizing in a stacking structure are to produce infinite linear chains of the central metal ions closely surrounded by parallel pseudo-$(SN)_x$ chains. The author therefore combined transition metal complexes based on α, β-dione dioximate (α, β-dodo) ligands with those based on α, β-dithiolate (α, β-dt) ligands in 1:1 molar ratios, assuming that they may crystallize in an alternated stacking structure. With diphenylethanedione dioximate (dpg) as the α, β-dodo, and diphenylethenedithiolate (dpedt) as the α,β-dt ligands, for example, the author has prepared a number of complexes which crystallize in dark, lustrous long needles typified by the 1:1 $Cu(dpg)_2/Ni(dpedt)_2$ and $Cu(dpg)_2/Pt(dpedt)_2$ systems. (5 refs.)

120300 Conducting SN polymers with integrated organic groups. G.Wolmershauser, R.Jotter, T.Wilhelm (Fachbereich Chem., Univ. Kaiserslautern, Kaiserslautern, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.729-32 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Polymers consisting of alternating sulfur nitrogen moieties and bifunctional heterocyclic groups are prepared via Si-N bond cleavage. All compounds are obtained in good yields as highly coloured or black materials which are insoluble in common organic solvents. The pristine materials show conductivities of approximately 5.10^{-16}-5.10^{-5} $\mathrm{Ohm}^{-1}\ \mathrm{cm}^{-1}$. In most cases higher conductivities can be achieved by doping the samples with acceptors, e.g. iodine. (7 refs.)

120301 Modified and free-flowing natural rubber. R.Gaczynski, L.Ciechanowicz (Inst. Przemyslu Gumowego Stomil, Piastow, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.109-13 (April 1983). In Polish. [received: Oct. 1983]
On the basis of literature data, the problem of modifying natural rubber has been discussed, and the possibility of practical utilization of the modified products with a view to their properties and profitability of production has been analyzed. In respect of their properties, these products are similar to thermoplastic rubbers, but the possibility of their application is rather doubtful. Various methods of preparing natural rubber in free-flowing form have also been considered. As the price of this rubber type lowers, it can find application in the rubber industry due to lower energy consumption used in its processing. (26 refs.)

81.20T Reinforced polymers and polymer-based composites

120302 Fabrication of a composite recording disc substrate. H.M.Hinkel (IBM Deutschland GmbH, Sindelfingen, Germany).
Composites (GB), vol.14, no.4, p.377-82 (Oct. 1983).
Composite magnetic recording discs, comprising carbon fibre-and glass fibre-reinforced epoxies clad by stainless steel foils, were fabricated by press moulding of prepregs, post-moulding machining of the inner and outer diameter (169 mm and 356 mm respectively) and surface polishing. The optimum flatness achieved was within 80 μm. Vacuum deposition of magnetic thin films on top of such composite substrates is feasible. Environmental humidity probably does not cause warpage or substrate weight increase exceeding the requirements for magnetic recording discs. However, the printing of fibre tows through the metal foils must be avoided, as must warpage caused by post-polishing. (8 refs.)

120303 The use of three-component polymeric composites in preparing a channel electron multiplier. B.Jachym, G.Wisniewski (Dept. of Phys., Tech. Univ. of Gdansk, Gdansk, Poland).
J. Phys. D (GB), vol.16, no.10, p.2023-32 (14 Oct. 1983).
The characteristics of secondary electron emission (SEE) of three-component composites including organic compounds have been investigated. The maximum SEE yield for conductive composites which consist only of polyvinylchloride and electroconductive particles such as NATCNQ and carbon black is low (less than 1). The addition of a third component, such as titanium, magnesium or beryllium oxides, sodium chloride, or the complex of TCNQ with anthracene, has enabled the authors to produce composites characterised by high maximum SEE yields for low energy of primary electrons. The study of the SEE yield from such electron-conductive polymeric composites shows that the SEE yield depends above all on the species and quantity of the third compound. On the basis of the data obtained a channel electron multiplier CEM has been developed. The CEM made of the three-component system is characterised by a gain of 10^7 to 10^8 (3 kV) at the maximum output current of 10^{-6} A. (10 refs.)

120304 A method for the evaluation of filler dispersion in vulcanized rubber. J.Milewska-Duda (Inst. Energochemii Wegla i Fizykochemii Sorbentow AGH, Krakow, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.3, p.85-6 (March 1983). In Polish. [received: Oct. 1983]
A method for the initial evaluation of filler dispersion in elastomer phase on the basis of density of filler, vulcanized rubber without filler, and filled vulcanized rubber has been presented. By way of example, calculation of the degree of dispersion for natural rubber vulcanizates filled with Sapex-20 carbon black has been presented. (4 refs.)

120305 Reinforcing laminates with the glass fibers. J.Tomaszewski, A.Wierdak.
Szklo & Ceram. (Poland), vol.34, no.4, p.131-6 (July-Aug. 1983). In Polish.
The development of the production of glass fibers in Krosno is desribed. The properties of Krosno fibers and the assortment of fibers made are discussed. The importance of sizing is stressed. Some information is given concerning the studies of the glass fibers in Krosno and the prospective plans of further development. (6 refs.)

120306 Development of high performance short fibre reinforced thermoplastics. R.H.Burton, M.J.Folkes, D.Kells (Dept. of Non-metallic Materials, Brunel Univ., Uxbridge, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.40/1-6
Short fibre reinforced thermoplastics are successfully being used in a wide range of engineering applications. However, there is considerable potential for further improvements in properties. To this end the authors have re-assessed the design of the material in the light of composite mechanics and have investigated the role of the interface and the effects of fibre attrition on component properties. (7 refs.)

81.30 PHASE DIAGRAMS AND MICROSTRUCTURES DEVELOPED BY SOLIDIFICATION AND SOLID-SOLID PHASE TRANSFORMATIONS

(see also 61. Structure of liquids and solids 64.70 Phase equilibria, phase transitions, and critical points)

120307 Thermal behaviour of poly(β-ketothioethers). F.Pilati (Istituto Chimico, Univ. di Bologna, Bologna, Italy), F.Andreani, L.Angiolini, P.Costa Bizzarri, C.Della Casa, P.Ferruti, N.Ghedini, M.Tramontini.
Polym. Commun. (GB), vol.24, no.10, p.309-13 (Oct. 1983).
The thermal behaviour of several polymers belonging to a new class, poly(β-ketothioethers), has been investigated by d.s.c. Many of these polymers are crystalline and show evidence of reorganization processes on heating. Their melting behaviour and thermal stability was found to be dependent on their chemical structure. (7 refs.)

120308 High-resolution electron microscopy of chemically vapor-deposited β-Si_3N_4-TiN composites. K.Hiraga, M.Hirabayashi, S.Hayashi, T.Hirai (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.539-42 (Aug. 1983).
Microstructures of Si_3N_4-TiN composites prepared by chemical vapor deposition (CVD) were investigated by the multibeam imaging technique using a 1 MV electron microscope. High-resolution images showed a number of fibrous TiN crystallites dispersed in the matrix of CVD β-Si_3N_4. Crystallographic orientation relations between β-Si_3N_4 and TiN were determined directly from the observed images in the subcell scale. The fibrous axis of TiN is parallel to the $\langle 110 \rangle$ direction of the NaCl structure and lies along the c axis of the hexagonal β-Si_3N_4 crystal. Domain boundaries, planar faults, nonplanar faults, and dislocations were found in the CVD β-Si_3N_4 matrix near the TiN crystallites. The origin of the structure defects is briefly discussed in connection with the formation of TiN crystallites in the matrix. (9 refs.)

120309 The arrangement of cells in a net. II. D.A.Aboav.
Metallography (USA), vol.16, no.3, p.265-73 (Sept. 1983).
For pt.I see ibid., vol.13, p.43 (1980). The arrangement of the differently shaped domains into which a thin film of arsenic-selenium glass is found to divide is compared with that of the cells of a foam and the grains of a polycrystal. The significance of the parameters of an empirical equation describing the arrangement is briefly discussed. (8 refs.)

81.30B Phase diagrams of metals and alloys

120310 The molybdenum corner of the ternary system Mo-Cr-B. A.M.Zakharov, S.I.Yudkovskii, Yu.S.Popova (Moscow Steel & Alloy Inst., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.10, p.1472-4 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1714-16 (Oct. 1982). [received: Sept. 1983]
The Mo-Cr-B ternary system has been studied in the molybdenum-rich region (up to 0.2 wt.% each of chromium and boron) by metallographic and X-ray diffraction analysis, alloy solidus temperature determination, and boride phase microhardness; isothermal sections have been plotted at 1950, 1600, and 1200°C and polythermal sections at a Cr:B ratio of 1:1 and a constant boron content of $\sim$0.02 wt.%. The alloys studied after quenching from 1200-1950°C have a single-phase or two-phase structure, containing in addition to the molybdenum-based solid solution a second phase consisting of a solid solution of chromium in Mo_2B or $(Mo, Cr)_2B$ with a tetragonal lattice ($CuAl_2$ type). The combined solubility of boron and chromium in molybdenum in the solid state falls as the temperature is lowered and as the chromium content increases. The microhardness of the boride Mo_2B in the alloy Mo+0.15B (wt.%) quenched from 1200°C is 17700±500 MPa, and that of the boride phase $(Mo, Cr)_2B$ in the alloys Mo+0.10Cr+0.16B and Mo+0.17Cr+0.51B (wt.%) is 17800 to 18500 MPa. (9 refs.)

120311 Phase composition and phase stability of a high-chromium nickel-based superalloy, IN939. K.M.Delargy, G.D.W.Smith (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
Metall. Trans. A (USA), vol.14A, no.9, p.1771-83 (Sept. 1983).
The experimental techniques of atom probe time of flight mass spectrometry, field emission STEM X-ray microanalysis, and electron probe X-ray microanalysis have been used to investigate the composition and stability of the various phases in alloy IN939 as a function of heat treatment and long-term exposure. The results show a need for some refinement of phase stability calculations, in particular, to take into account the incomplete partitioning of alloy elements between phases and the effects of different exposure conditions during service. The effects of segregation during casting have also been investigated. (26 refs.)

120312 Phase fields and initial melting diagrams of the pseudoquaternary system UC-MoC_{1-x}ZrC-NbC. V.F.Funke, I.V.Pshenichnyi, L.A.Pliner, Yu.D.Loktionov.
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.110-16 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.41-7 (Feb. 1983). [received: Sept. 1983]
An account is given of an investigation of the phase compositions and initial melting points of alloys of the quasiquaternary system UC-MoC_{1-x}-ZrC-NbC. The starting alloy components were $U_{0.51}C_{0.49}$, $Zr_{0.508}C_{0.492}$, $Nb_{0.506}C_{0.494}$ (free carbon less than 0.1%, O and N less than 0.03%), and $Mo_{0.58}C_{0.42}$ (free carbon 0.3%, O and N less than 0.01%). The cubic modification of molybdenum carbide was stabilized by adding to it 2% Ti. (4 refs.)

120313 On the Co-Ti system. B.Uhrenius (Sandvik AB, Stockholm, Sweden), K.Forsen.
Z. Metallkd. (Germany), vol.74, no.9, p.610-15 (Sept. 1983).
Cobalt rich Co-Ti alloys were investigated by making micro-probe and X-ray measurements on quenched DTA-specimens and diffusion couples. Equilibria involving the liquid, FCC-Co, Co_3Ti (ordered FCC) and Co_2Ti phases were analysed. The cubic Co_2Ti-phase was found in equilibrium with the Co_3Ti-phase in contradiction to information available in the literature. The experimental information was analysed in thermodynamic terms and the Co-rich part of the phase diagram was calculated using these results. (24 refs.)

120314 Experimental aspects of solid galvanic cell methods for thermodynamic studies on alloys. H.Kleykamp (Kernforschungszentrum Karlsruhe, Inst. fur Material- und Festkorperforschung, Karlsruhe, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.777-81 (Sept. 1983).
The phase diagrams of the ZrO_2-CaO, ZrO_2-Y_2O_3, ThO_2-Y_2O_3 and ThO_2-La_2O_3 systems are discussed in view of the use of the electrolytes in EMF measurements. Thermodynamic studies on metallic A-B systems using solid galvanic cells with oxygen and fluorine ion conducting electrolytes require the knowledge of the phase diagrams of the corresponding ternary A-B-O and A-B-F systems for the cell arrangements. Examples for misleading EMF measurements by use of incompatible electrodes are given. Asymmetric cells, side reactions between the electrodes and the electrical leads, and impurities in the cover gas as sources for erroneous EMF measurements are demonstrated. The characteristics of reference electrodes for oxide electrolytes in environments with different oxygen partial pressures are outlined. The role of oxygen as an impurity in the electrodes for CaF_2 electrolytes is investigated. (32 refs.)

120315 Phase composition of vacuum condensates in the Y_2O_3-ZrO_2 system. G.I.Batalin, V.D.Kushkov, O.V.Kachur, L.V.Pashchenko, I.S.Koslov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.77-8 (1983). In Ukrainian.
The Y_2O_3-ZrO_2 condensates were obtained by electron-beam evaporation and condensation in vacuum. Data on their phase composition are presented. Temperature and concentration limits of the field of the preferential crystallite orientation are also revealed. (5 refs.)

120316 Solid-state quaternary phase equilibrium diagram for the Hg-Cd-Te-O system. D.R.Rhiger, R.E.Kvaas (Santa Barbara Res. Center, Goleta, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1712-18 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
For the Hg-Cd-Te-O system an approximate three-dimensional diagram of quaternary phase equilibrium at room temperature has been constructed for the first time, to aid in the study of $Hg_{1-x}Cd_xTe$ surface oxides. Thermodynamic calculations based on standard Gibbs energies of formation were performed to determine which phases are mutually stable. Stability relationships were checked by reaction experiments in mixtures of bulk reference compounds, using Raman spectroscopy for analysis. Elemental Hg is shown to coexist in equilibrium with all of the oxide and telluride phases. Thus, it is likely to be present whenever oxidation is incomplete. $CdTeO_3$ is shown to be stable with respect to the other oxides and tellurides. Several instabilities are indicated, in which an oxide can react with the $Hg_{1-x}Cd_xTe$ to release elemental Hg or Te, or HgTe. (15 refs.)

120317 Phase equilibria in the ZnO-CdO-Fe_2O_3 system with a concentration of Fe_2O_3 of less than 50 mole %. L.A.Bashkirov, N.V.Kornilova (Inst. of Solid-State Phys. & Semiconductors, Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1587-90 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1847-9 (Nov. 1982).
The compositions of the phases in equilibrium were determined by X-ray phase analysis for the range of compositions of the ZnO-CdO-Fe_2O_3 ternary system bounded by $ZnFe_2O_4$-$CdFe_2O_4$ and ZnO-CdO oxide systems at a calcining temperature of 1275K, and the phase diagram, consisting of two two-phase regions and one three-phase region, was plotted. Zinc-cadmium ferrites and solid solutions of CdO in ZnO and ZnO in CdO are the coexisting phases in the two-phase regions. Solid solutions of $Zn_{0.75}Cd_{0.25}Fe_2O_4$, $Zn_{0.88}Cd_{0.12}O$, and $Cd_{0.94}Zn_{0.06}O$ are in equilibrium in the three-phase region. Limited reciprocal solubility of the components is observed in the ZnO-CdO binary system. (4 refs.)

120318 Interaction in the system ZrO_2-MgO-$MgCr_2O_4$. S.G.Sennikov, G.E.Revzin (All-Union Sci. Res. & Design Inst. for Aluminum, Magnesium, Electrode Industry, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1651-3 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1915-16 (Nov. 1982).
The melting points were determined by the micro-DTA technique in three series of isoconcentrates containing 5, 10, and 15 mole % MgO. The proportions of spinel and zirconium dioxide were varied at intervals of 5 mole %. The solubility in the solid phase was studied in samples annealed in argon atmosphere at 1750°C for 48 h and quenched at room temperature. The concentrations of the dissolved phases were determined by X-ray diffraction and microdiffractospectral analyses. The pattern of the meltability curves of the investigated isoconcentrates indicates absence of ternary compounds. The shift of the eutectic points of the isoconcentrates to the region richer in ZrO_2 and rise of their temperatures should be taken note of as a general mechanism. (7 refs.)

120319 Comments on 'Phase equilibria in the Mn_2O_3-Mn_3O_4-MnO system in CO_2-H_2 mixtures'. M.Keller, R.Dieckmann (Inst. for Phys. Chem. & Electrochem., Univ. of Hanover, Hanover, Germany).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.9, p.650-1 (Sept. 1983).
Comments are made on the paper by Terayama et al. (see ibid., vol.24, p.24, 1983), in which experimental results on the stoichiometry of two manganese oxides, manganosite and hausmannite, as a function of temperature and O_2 partial pressure were reported. By comparing these results with data from Bransky and Tallan (1971) and new measurements by the present authors, it is found that considerable discrepancies are evident. (5 refs.)

120320 Mechanical properties of Sn-Ag_3Sn alloys. J.F.Bromley, F.Vnuk, R.W.Smith (Dept. of Metall. Engng., Queen's Univ., Kingston, Ontario, Canada).
J. Mater. Sci. (GB), vol.18, no.10, p.3143-53 (Oct. 1983).
The structure and properties of Sn-Ag_3Sn directionally-frozen eutectic alloys have been examined over the growth range 2×10^{-4} to 2×10^{-1} mm sec^{-1}. The structure is predominantly broken lamellar to 1.3×10^{-2} mm sec^{-1}, but with relatively poor alignment to the growth direction at smaller growth rates. The tensile and compressive strengths were measured. These increase monotonically to the growth rate at which cellular growth ensues, after which point they fall. The hardness of the eutectic closely parallels the compressive properties as the growth rate increases. Quenching from 200°C produces a marked increase in compressive strength and hardness, attributed to the quench-hardening of the Sn-rich phase. (32 refs.)

120321 Solidification and solid state transformations during cooling of chromium-molybdenum white cast irons. J.D.B.DeMello, M.Durand-Charre, S.Hamar-Thibault (ENSEEG Domaine Univ., Saint Martin d'Heres, France).
Metall. Trans. A (USA), vol.14A, no.9, p.1793-801 (Sept. 1983).
Two series of Cr, Mo white cast irons were investigated by different techniques. Differential thermal analysis was carried out to determine the liquidus and eutectic temperatures. Unidirectional solidification was used to promote coarser structures easier to analyze. Furthermore, the microstructures of the sample, quenched during a slow unidirectional solidifcation, illustrate the behavior of the alloy during continuous cooling. The precipitates were characterizd by scanning and transmission electron microscopy and microprobe analysis. The main findings are reported: (1) a correlation was found between the end of solidification and the chromium to carbon ratio; (2) the determination was made of the crystallization path; (3) in some high Cr/C ratio alloys a peritectic reaction occurs on the border of the grain giving a δ ferritic phase; (4) then this δ ferrite was found to decompose in a complex manner giving austenite and ferrite probably in a lamellar structure, then precipitates of M_6C and Mo_2C in the austenitic and ferritic phases, respectively; and (5) according to the kinetics of cooling, some alloys undergo martensitic and bainitic transformations. (20 refs.)

120322 Process and structural aspects of melt-spun nickel-based superalloy ribbons. H.H.Liebermann (General Electric Corporate Res. & Dev., Schenectady, NY, USA), R.E.Maxwell, R.W.Smashey, J.L.Walter.
Metall. Trans. A (USA), vol.14A, no.9, p.1817-23 (Sept. 1983).
Various experimental aspects regarding the chill block melt-spinning of nickel-base superalloy ribbons have been investigated. High speed movies have been used to characterize the process, which is found to obey empirical equations aready established for amorphous and low melting temperature crystalline alloys. Extensive characterization of ribbons formed has been used to assess variations in solidification rate caused by the adjustment of process parameters. Various ribbon microstructures are related to the cooling rate at local points within the ribbon during melt-spinning and are explained in terms of the effects of limited sample-substrate wetting and ribbon thickness. Theoretical and experimental factors affecting microstructural development are discussed. (30 refs.)

120323 Microstructural modification of austenitic stainless steels by rapid solidification. J.M.Vitek, A.Dasgupta, S.A.David (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1833-41 (Sept. 1983).
The microstructural modifications in three austenitic stainless steels (types 308, 310, and 312) were evaluated after rapid solidification. These three steels are commonly used weld filler metals. Two methods of rapid solidification were investigated, autogenous laser welding and arc-hammer splat quenching. The structure of 310 stainless steel was found to be 100% austenite, and did not vary over the range of conditions studied. On the contrary, the structures of types 308 and 312 steels were very sensitive to the cooling rates and solidification conditions. With the highest cooling rates, the type 308 structure was fully austenitic while the type 312 structure was fully ferritic. At lower cooling rates the structures were duplex ferrite plus austenite. The results were interpreted in terms of faster kinetics of solidification of austenite compared to ferrite under the conditions examined. A comparison of the structures produced by the two rapid solidification techniques indicated the cooling rates are comparable. (24 refs.)

120324 New-generation aluminium alloys through rapid solidification processing. T.R.Anantharaman (Inst. of Technol., Banaras Hindu Univ., Varanasi, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.49, no.1, p.1-17 (1983).
The author considers rapid solidification processing, particularly for the development of new-generation aluminium alloys. The process is described, together with the properties of aluminium and the improvement of its alloys. The underlying science-technology-engineering R&D sequence is highlighted and the consequences for industry in India are discussed. (5 refs.)

120325 Residual stresses in plastics sheet and injection mouldings. N.J.Mills (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.36/1-5
Extruded and injection moulded plastics products solidify under conditions which cause high temperature gradients. For flat products which solidify at atmospheric pressure the contraction in overall length during solidification leads to a roughly parabolic variation in the in-plane residual stresses, with tensile stresses at the mid-thickness. Some factors that affect the residual stress development in injection mouldings have been analysed, in particular the pressure variation in the core of a flat moulding, and the two-dimensional heat flows near reinforcing ribs and the corners of mouldings. 120326 Phase transitions and thermoluminescence of a plasma-sprayed zinc silicate phosphor. T.Takamori, D.B.Dove (IBM Corp., Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), C.L.Huffine.
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.127-9 (Aug. 1983).
A plasma-sprayed zinc silicate phosphor was heat-treated at ≈800°C in forming gas; the major phase present was the metastable β phase, as revealed by bright yellow fluorescence under UV excitation. On heat treatment at ≈1000°C in air, a green fluorescence developed as a result of the formation of the stable α phase. However, its thermoluminescence characteristics were different from those of the original Pl phosphor used for spraying. (20 refs.)

120327 Kinetics of Austenite-pearlite transformation in eutectoid carbon steel. E.B.Hawbolt, B.Chau, J.K.Brimacombe (Dept. of Metall. Engng., Univ. of British Columbia, Vancouver, BC, Canada).
Metall. Trans. A (USA), vol.14A, no.9, p.1803-15 (Sept. 1983).
The kinetics of the austenite-to-pearlite transformation have been measured under isothermal and continuous-cooling conditions on a eutectoid carbon (1080) steel using a diametral dilatometric technique. The isothermal transformation kinetics have been analyzed in terms of the Avrami equation containing the two parameters n and b; the initiation of transformation was characterized by an empirically determined transformation-start time (t_{Av}). The parameter n was found to be nearly constant; and neither n nor b was dependent on the cooling rates between T_{A1} and the test temperature. Continuous-cooling tests were performed with cooling rates ranging from 7.5 to 108°C per second, and the initiation of transformation was determined. Comparison of this transformation-start time for different cooling rates with the measured slow cooling of a test coupon immersed in a salt bath indicates that, particularly at lower temperatures, the transformation in the traditional T-T-T test specimen may not be isothermal. (21 refs.)

120328 Single crystal neutron diffraction study of the long-range order in Cu_2NiZn. G.van der Wegen (Dept. of Appl. Phys., Univ. of Groningen, Groningen, Netherlands), R.Helmhold, P.Bronsveld, J.De Hosson.
Z. Metallkd. (Germany), vol.74, no.9, p.592-7 (Sept. 1983).
The long-range Zn ordering in Cu_2NiZn is determined as a function of the annealing temperature by single crystal neutron diffraction. It is well established that the character of the order-disorder transition at 767K is of first order. Ordering data obtained from electron microscopic observation of the separation between superlattice dislocations are consistent with the authors' results. An attempt to determine the Cu/Ni ordering below 574K was not yet successful mainly because the kinetics of the ordering at such low temperatures is rather slow. (13 refs.)

120330 Structurally free cementite in low-carbon steels. V.V.Parusov, K.F.Starodubov, B.F.Martsiniv, V.I.Sukhomlin, V.A.Oliinik.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.82-4 (1983). In Ukrainian.
It is suggested that the mechanism of the structurally free cementite formation in mild steel is based on the kinetic theory of phase transformation. Recommendations on cooling regimes which eliminate the structurally free cementite formation are given for low-carbon austenite. (6 refs.)

120331 Cleaning effect of rare earths on grain boundary segregation in steels. Luo Di, Xing Guohua (Central Iron & Steel Res. Inst., Min. of Metall. Industry PRC, Beijing, China), Zhou Huiliang, Yan Shensheng, Yu Zhizhong, Luo Xinghua.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.278 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given, as follows. The segregation of sulphur and phosphorus at the grain boundaries of the austenite and cast structures of high speed steels was studied in detail using Auger electron spectroscopy. The more sulphur and phosphorus the steel contained, the greater was the segregation. The addition of rare earths to the steel caused a rapid decrease in the sulphur and phosphorus grain boundary segregation. Complete disappearance of sulphur segregation was observed when the rare earth addition was 0.05%-0.08%. A possible explanation of this segregation and the grain boundary cleaning effects of the rare earth is proposed.

120332 Microstructural characterization of doped dicalcium silicate polymorphs. A.Ghose, S.Chopra, J.F.Young (Dept. of Civil Engng. & Ceramic Engng., Univ. of Illinois, Urbana, IL, USA).
J. Mater. Sci. (GB), vol.18, no.10, p.2905-14 (Oct. 1983).
This study has shown that both β and α'-C_2S can be readily stabilized by suitable doping with BaO, B_2O_3, and P_2O_5, using a single firing at 1450°C. The β-C_2S samples all have similar lamellar structures, irrespective of the dopant present, which show (100) twinning. Grain boundary phases are present in all β-C_2S preparations. The α'-C_2S crystals usually contain precipitates and associated strain fields and dislocations, but a grain boundary phase was only observed in α'-C_2S stabilized by BaO. Some correlation between reactivity and presence of dislocations and strain fields has been suggested for the α'-C_2S phase. (22 refs.)

120333 Electron microscopic investigations on a melt-quenched Al-Rh alloy. Z.A.Chaudhury, C.Suryanarayana (Dept. of Metall. Engng., Banaras Hindu Univ., Varanasi, India).
J. Mater. Sci. (GB), vol.18, no.10, p.3011-22 (Oct. 1983).
An Al-2wt% Rh alloy was subjected to rapid quenching from the molten state and transmission electron microscopy and diffraction techniques were extensively used to characterize the phases present. Melt quenching led to the formation of a homogeneous solid solution indicating a substantial increase in solid solubility limit over the equilibrium value. Although stable up to about 640K, the supersaturated solid solution decomposed at elevated temperatures to a mixture of aluminium solid solution and an intermediate phase, which has been identified to have a monoclinic structure with $a=1.636$ nm, $b=0.805$ nm, $c=1.279$ nm and $\beta=107.77°$ with a stoichiometry corresponding to $Al_{13}Rh_4$. Although heterogeneous nucleation at grain boundaries was the predominant feature, the precipitate also formed as Widmanstatten platelets inside the grains. This phase has been shown to be an equilibrium phase. Very long annealing treatments at temperatures of 773K resulted in the formation of an ordered phase. The long-range order was destroyed on heating to still higher temperatures. The equilibrium constitution of the alloy has been shown to be a mixture of $Al_{13}Rh_4$ and aluminium solid solution. (28 refs.)

120334 Electron microprobe analysis of phase segregation in the Heusler alloy $Cu_{2.00}Mn_{1.00}Al_{1.00}$. R.Kozubski, J.Soltys (Inst. of Phys., Jagellonian Univ., Krakow, Poland), R.Kuziak.
J. Mater. Sci. (GB), vol.18, no.10, p.3079-86 (Oct. 1983).
Aged specimens of the alloy $Cu_{2.00}Mn_{1.00}Al_{1.00}$ were examined by means of the ARL scanning electron microprobe quantometer. The process of segregation of the components was observed and the precipitates were identified with the phases detected previously by means of X-ray diffraction. The observed evolution of microstructures and the results of X-ray diffraction and magnetometric measurements were the basis of the description of the process of the decomposition of β-phase of the system Cu-Mn-Al at temperatures below 973K. Considerable difference between the microstructures of the alloy annealed below and above 700K confirmed the previously indicated existence of a critical point localized between 673 and 723K. (18 refs.)

120335 Microanalytical investigation of sintered SiC. II. Study of the grain boundaries of sintered SiC by high resolution Auger electron spectroscopy. R.Hamminger, G.Grathwohl, F.Thummler (Univ. Karlsruhe, Karlsruhe, Germany).
J. Mater. Sci. (GB), vol.18, no.10, p.3154-60 (Oct. 1983).
For pt.I see ibid., vol.18, p.353 (1983). UHV-fracture surfaces of different (B, C)- and (Al, C)-doped pressureless sintered SiC materials are investigated by using high resolution Auger electron spectroscopy (HRAES). The grain boundaries at intergranular fractured regions of (B, C)-doped materials are evidently free of any enrichment of impurity elements or sintering additives. In contrast, the (Al, C)-doped materials reveal the existence of thin Al-containing grain boundary films. Sputtering indicates their thickness to be less than 1 nm. The concentrations of the elements segregated in the grain boundary films are determined. (14 refs.)

120336 Precipitation and solid solubility in the system $NiO-Cr_2O_3$. C.-H.Chen, M.R.Notis, D.B.Williams (Dept. of Metall. & Materials Engng., Lehigh Univ., Bethlehem, PA, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.566-71 (Aug. 1983).
The precipitation of $NiCr_2O_4$ and the solid solubility of Cr^{3+} in NiO were investigated. Homogeneous precipitation occurs in this system, and the decomposition of $NiO-Cr_2O_3$ solid solution involves only one stable equilibrium phase, $NiCr_2O_4$. The small lattice misfit between precipitate and matrix results in the formation of randomly distributed spherical precipitates about 3 to 10 nm in diameter in the initial stage of growth. Above that size, precipitates form as ellipsoidal plates lying on $\{100\}$ with all directions of the precipitate and matrix mutually parallel. Strain-energy effects provide a rational explanation for the observed precipitate morphology during nucleation and subsequent growth. The precipitates grow along $\langle 100\rangle$ to a size at which coherency is no longer maintained. The loss of coherency is associated with the development of interfacial dislocations, and the critical size at which coherency is lost is ≈300 nm. Dissolution of coherent precipitates and growth of semicoherent precipitates was directly observed to occur simultaneously when both are present. (22 refs.)

120337 Intergranular segregation studies in steels using STEM-EDS X-ray microanalysis. P.Doig, P.E.J.Flewitt (South Eastern Region, Sci. Services Dept., CEGB, Gravesend, England).
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3, p.193-210 (1983). (Meeting of the French and Belgian Societies for Electron Microscopy, Liege, Belgium, 16-19 May 1983).
Results are described for STEM-EDS X-ray microanalysis of equilibrium and nonequilibrium solute segregations to prior austenite grain boundaries in a range of ferritic steels typically used in electrical power generating plants. Consideration is given to the requirements and limitations of the microanalysis technique. Examples have been selected which demonstrate the various solute profiles and distributions which may develop for various heat treatment and alloy compositions. (27 refs.)

120338 Formation of etch boundaries at the interface of Mo grains and a liquid Ni-Fe matrix during cyclic annealing. Sung Soo Kim, D.N.Yoon (Dept. of Materials Sci., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
Metallography (USA), vol.16, no.3, p.249-53 (Sept. 1983).
Describes direct observations of the grain-coarsening process with cyclic annealing treatment. The specimens of 85 wt.% Mo-13.5 wt.% Ni-1.5 wt.% Fe were prepared from powders about 5 μm in size by powder metallurgy techniques. The growth pattern of the isolated grains was shown to be nearly concentric, in agreement with the usual assumptions made in the theories of Ostwald ripening. (9 refs.)

120339 An AEM investigation of the formation of precipitate-free zones in an Al-16 wt.% Ag alloy: determination of equilibrium and metastable solvus lines. S.M.Merchant, M.R.Notis, D.B.Williams (Dept. of Metall. & Materials Engng., Lehigh Univ., Bethlehem, PA, USA).
Metall. Trans. A (USA), vol.14A, no.9, p,1825-31 (Sept. 1983).
Precipitation of the equilibrium γ-phase at grain boundaries in an aged Al-16 wt.% (∼4.5 at.%) Ag alloy is responsible for the formation of a solute depleted region, free of metastable Guinier-Preston (GP) zones, in the immediate vicinity of the grain boundary. Solute concentration profiles have been obtained across these grain boundary regions using analytical electron microscopy (AEM) in thin foils of the alloy aged at low temperatures. The Ag concentrations at the grain boundary (between γ precipitates) and at the edge

of the precipitate-free zone have been used to determine the solid solubility of Ag in Al (the $\alpha/\alpha(\alpha+\gamma)$ solvus) and the metastable GP zone solvus line, respectively. (36 refs.)

120340 On the size-shape relation of Guinier-Preston zones and α_R'-precipitates in an Al-6.8 at.% Zn alloy. R.Ramlau, H.Loffler (Sektion Math./Phys., Padagogischen Hochschule Halle, Halle, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.141-8 (Sept. 1983).
Ellipsoidal Guinier-Preston zones and lenticular precipitates of the α_R'-phase grown at 120°C in an Al-6.8 Zn at.% alloy are examined by means of transmission electron microscopy. For each particle two characteristic lengths are determined and the corresponding two-dimensional histograms are established. It can be shown that the precipitates monotonically flatten with increasing size. Hence, the size-shape relation did not provide any indication of the phase transition. (14 refs.)

120341 Long-term ageing characteristics of Hastelloy alloy X. H.M.Tawancy (Cabot Corp., Kokomo, IN, USA).
J. Mater. Sci. (GB), vol.18, no.10, p.2976-86 (Oct. 1983).
Transmission electron microscopy and diffraction were used to characterize the microstructural changes which occur in Hastelloy alloy X after long-term ageing (up to 16000 h) at various temperatures in the range 540 to 870°C. The corresponding effects on mechanical properties were determined. It was found that the alloy age hardens at temperatures in the range of 650 to 870°C. Overageing occurred at 760 and 870°C. Marked reductions in room-temperature tensile elongation were observed after ageing at all the temperatures investigated. However, in no case was the elongation reduced to less than 15 to 30%. Also the tensile elongation at temperatures corresponding to the respective ageing temperatures was unaffected by 16000 h ageing at a temperature. It was concluded that the above effects were associated with precipitation of various phases, such as carbides, sigma- and mu-phases, in the matrix and at the grain boundaries. (11 refs.)

120342 Enhanced age hardening of 7075 aluminum alloy after ultrasonic vibration. M.M.Shea (Metall. Dept., General Motors Res. Labs., Warren, MI, USA), B.V.N.Rao.
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.67-77 (Oct. 1983).
The influence of ultrasonic vibration (40 kHz; $\epsilon = \pm 6.4 \times 10^{-5}$) at 5°C on the hardening behavior of commercial grade 7075 aluminum alloy during aging at 120°C was investigated. Compared with the corresponding values for univibarted material, vibration increased the hardening kinetics and resulted in higher hardness at the peak-aged condition. The main effect of vibration occurred during the initial stag of ageing where Guinier-Preston (GP) zones determine the hardening behavior. The results support the hypothesis that vibration increases GP zone nucleation, resulting in a higher volume fraction of zones early in the aging process. Zone growth during this period was unaffected by vibration. The hypothesis of more zone nucleation is consistent with the observed distinct plateau region in hardness due to the relief of solute supersaturation required for zone formation. The plateau region represents an incubation period for nucleation of η' during which GP zones become ordered. Although the sequence of precipitation was unaltered by vibration, after aging for 24 h, the zone diameter and η' size were smaller in specimens which had been vibrated than in normally processed specimens. (26 refs.)

120343 Weld microstructure of $(Ni,Fe)_3(V,Ti)$ long-range-ordered alloy. D.N.Braski, S.A.David (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1785-91 (Sept. 1983).
The microstructure of gas tungsten arc (GTA) welds of a $(Ni,Fe)_3(V,Ti)$ long-range-ordered alloy has been investigated. Crack-free welds were produced in which the heat affected zone (HAZ) and fusion zone were disordered and softened. A post-weld heat treatment increased the hardness of both zones by reordering the structure. The reordering treatment produced additional hardening in the fusion zone due to precipitation of small VC particles on grain boundaries and matrix dislocations. (5 refs.)

120344 Neutron small angle scattering on ZrO_2 particles in platinum 10 rhodium. D.Schwahn (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), G.Hammer.
Z. Metallkd. (Germany), vol.74, no.9, p.598-602 (Sept. 1983). In German.
ZrO_2 particles in a PtRh solid solution alloy were investigated with neutron scattering in order to determine the influence of oxidation and high temperature annealing on the particle size and density. It was shown that the particles have a bimodal size distribution with average diameters independent of applied oxidation times and temperatures. After annealing at 1400°C for 1000 h, the particles grew to more than twice their original size. (11 refs.)

81.40E Cold working, work hardening; annealing, recovery and recrystallisation; textures

120345 The use of a quadratic form for the determination of non-negative texture functions. P.Van Houtte (Dept. Metaalkunde, Katholieke Univ. Leuven, Leuven, Belgium).
Textures & Microstruct. (GB), vol.6, no.1, p.1-20 (1983).
The classical analysis of measured pole figures of textured polycrystals by the series expansion method does not necessarily produce a non-negative texture function. The main reason for this is, that the method is unable to find the terms of odd rank l of the series expansion. A new method is proposed, which introduces the non-negativity condition into the series expansion method by the use of quadratic forms. The method is found to be successful when treating sharp textures, which have a considerable zero range in Euler space. The preliminary determination of this zero range by experimental methods is however not necessary. (12 refs.)

120346 Texture and cleavage in molybdenum. P.I.Welch (Inst. fur Metall., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany), G.J.Davies.
Textures & Microstruct. (GB), vol.6, no.1, p.21-37 (1983).
It is of considerable technological importance to establish how far textures introduced into controlled-rolled steels by finish rolling at low temperatures may affect the fracture strength. The purely textural effect is difficult to isolate in such steels because of anisotropy associated with grain shape, inclusions and pearlite banding. Consequently, an investigation was carried out using molybdenum, a b.c.c. single phase material showing good structural homogeneity, as a model. Texture development was studied using crystallite orientation distribution function analysis to identify a suitable processing route leading to a sharp texture with a suitable distribution of $\{100\}$ cleavage planes. The behaviour of a sharply textured specimen was analysed by taking fracture specimens from various orientations in the plate. The energy absorbed in impact showed a positive correlation with the density of 100 planes in the crack direction, but the extent of the variation was less than would have been expected had crack propagation been the controlling step in the fracture process. (26 refs.)

120347 Shear bands and the development of the brass annealing texture. T.Ozturk (Dept. of Metall. Engng., Middle East Tech. Univ., Ankara, Turkey).
Textures & Microstruct. (GB), vol.6, no.1, p.39-43 (1983).
Shows experimentally that the contention that the brass annealing texture originates from recrystallization within shear bands does not necessarily contradict the oriented-growth theory, since a growth selection process similar to that postulated to occur in the matrix could occur within the bands. Nevertheless the nature of the present observation is more in accordance with the oriented-nucleation concept. In this sense, therefore there exists a strong indication that the brass annealing texture has its origin in the nature of the deformed microstructure which has evolved by simple shear. (12 refs.)

120348 The determination of crystallographic textures from selected areas of a specimen by electron diffraction. F.J.Humphreys (Dept. of Metall. & Materials, Imperial Coll., London, England).
Textures & Microstruct. (GB), vol.6, no.1, p.45-61 (1983).
A technique for the determination of partial pole figures with an angular resolution of $<3°$, from selected areas of a thin foil, is described. A microcomputer, interfaced to an unmodified JEOL 100 CX TEMSCAN electron microscope is used to scan a diffraction pattern over a detector, tilt the specimen in steps of 1.5° over a range of $\pm 50°$, and plot the resulting data as a semiquantitative pole figure. The application of the technique to the study of materials which deform inhomogeneously is discussed, and examples are given of pole figures obtained from deformed single phase and two phase aluminium specimens. (5 refs.)

120349 Deformation and recrystallisation textures of polycrystalline nickel. J.Pospiech, J.Jura (Inst. for Metal Res., Polish Acad. of Sci., Cracow, Poland), A.Mucklich, K.Pawlik, M.Betzl.
Textures & Microstruct. (GB), vol.6, no.1, p.63-79 (1983).
The development has been analysed of the primary recrystallisation texture in samples of polycrystalline nickel rolled to various degrees of reduction. A great similarity between the texture characteristics of copper and nickel has been found. Regularities of cube texture development were established and compared with results of texture and microstructure investigations obtained by other authors. (20 refs.)

120350 Can inherited textures in the BCC phase furnish information about the type of transformation from the FCC phase?. V.Jung (Kernforschungszentrum Karlsruhe, Inst. fur Angewandte Kernphys. I, Karlsruhe, Germany).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.535-41 (1 Oct. 1983).
Stretching annealed cylindrical 18/8 Cr-Ni steels produces transformed HCP and BCC phases, both showing major textural contributions with increasing stretching of the cylindrical specimens. After stretching, the original FCC phase shows two orientations: $[100]_{FCC} \|$ cylinder axis and $[111]_{FCC} \|$ cylinder axis, i.e. direction of stress. In both cases, the martensitic phase is produced by slipping and shear in the FCC→HCP→BCC sequence by Nishiyama-Wasserman (N-W) or Kurdjumov-Sachs (K-S) transformations in the $(111)_{FCC}$ planes, which enclose angles $\neq 0.90°$ with the direction of stress, i.e. the cylinder axis. The orientation distributions of the $(100)_{BCC}$ reflexion, calculated by means of a very simple model, are compared with the distribution measured by neutron diffraction to obtain information on the bulk material. The special K-S transformation with only six $(110)_{BCC}$ orientations in the ω scan together with the special N-W transformation with six orientations in the ω scan show relatively good agreement with the measured distribution. Both transformation processes are based on continuous tilting of the newly formed $(110)_{BCC}$ places in the direction of the cylinder axis during the deformation process. (9 refs.)

120351 Influence of cold hydropressing conditions on the density of tool steels. B.I.Beresnev, V.Z.Spuskanyuk, G.O.Lyads'ka, V.A.Bogdanov, R.M.Lappa, A.I.Mel'nickenko, M.L.Sokolov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.78-82 (1983). In Ukrainian.
Deals with the influence of cold hydropressing on the density and mechanical properties of tool steels. It is shown that material loosening is characterized by the stale composition and deformation condition, of the material. There exists a limiting deformation above which the negative influence of defects such as micropores and microcracks due to deformation prevails over the positive influence of structural changes giving rise to improvement in mechanical properties of the material after final heat treatment. When at cold hydroprocessing backpressure is imposed, this makes it possible to slow down a decrease in density of the material and to increase the operating characteristics of products. (8 refs.)

120352 The morphology of martensite in Fe-C, Fe-Ni-C and Fe-Cr-C alloys. M.Umemoto, E.Yoshitake, I.Tamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).
J. Mater. Sci. (GB), vol.18, no.10, p.2893-904 (Oct. 1983).
The morphology of martensite in widely varying series of FE-C, Fe-Ni-C and Fe-Cr-C alloys was investigated using optical microscopy. The effects of formation temperature and alloying elements on the martensite morphology were studied in detail. It was found that in Fe-C alloys, lath martensite forms in alloys with less than 0.8 wt% carbon, butterfly martensite forms in alloys with between 0.98 and 1.42 wt% carbon and lenticular martensite forms in alloys with more than 1.56 wt% carbon. In Fe-Ni-C alloys, four different martensite morphologies form depending upon the formation temperature and composition, and for alloys of a fixed carbon content the martensite morphology changes from lath to butterfly to lenticular to thin plate as the formation temperature is decreased. In Fe-Cr-C alloys, lath martensite forms at high temperature, and below the lath formation temperature mainly $\{225\}_f$ plate martensite is formed. (32 refs.)

120353 Ageing of austenitic iron alloys containing nitrogen. P.Ferguson, J.H.Driver, A.Hendry (Wolfson Res. Group for High-Strength Materials, Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
J. Mater. Sci. (GB), vol.18, no.10, p.2951-6 (Oct. 1983).
The Lifshitz-Wagner theory of coarsening (1961) applied to the experimental data for titanium and vanadium nitride precipitates in austenitic iron-nickel steels shows that Ostwald ripening is controlled by diffusion of the substitutional titanium or vanadium solute atoms. The influence of oxygen impurity is shown to modify both the VN coarsening behaviour and growth morphology. (21 refs.)

120354 The influence of thermal history on the microstructure of sulfonated polystyrene ionomers. R.A.Weiss, J.Lefelat, H.Toriumi (Univ. of Connecticut, Storrs, CT, USA).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.8, p.661-7 (Aug. 1983).
A recent article reported on the thermal behavior of several sulfonated polystyrene ionomers aged for up to 8 months at room temperature after being cooled from the melt. By using differential scanning calorimetry (DSC) the authors observed in the thermograms of these materials an anomalous endothermic event below T_g, and the intensity of this endotherm was a function of aging time and sulfonate concentration. The endotherm may represent the relaxation of strain energy that develops from internal stressing of the polymer chains as the sulfonate groups diffuse into more favored conformations, e.g., ionic clusters. The presence of ionic clusters in these ionomers has been confirmed recently by small-angle X-ray scattering (SAXS). The authors report on some SAXS studies that lend support to their hypothesis of a time and temperature dependence of the microphase separation in these materials. In addition, they describe some preliminary electron spin resonances (ESR) studies of these ionomers that demonstrate a strong dependence of the cation-cation interaction on the thermal history of the ionomer. (8 refs.)

120355 A TEM study of microstructural changes during retrogression and reaging in 7075 aluminum. Nguyen Cong Danh, K.Rajan, W.Wallace (Nat. Aeronaut. Establ., Nat. Res. Council Canada, Ottawa, Ontario, Canada).
Metall. Trans. A (USA), vol.14A, no.9, p.1843-50 (Sept. 1983).
Microstructural changes occurring during retrogression, and during retrogression plus reaging in 7075-T6 aluminum alloy have been investigated by means of transmission electron microscopy, and related to mechanical properties. TEM results indicate that the drop in strength during the initial stage of retrogression was due to the partial dissolution of GP zones while the growth of the semi- coherent ϵ' was responsible for the rapid recovery of strength. It is suggested that the retrogression and reaging treatment resulted in the increase in volume fraction of GP zones and especially η' precipitates over both the T6 and retrogressed conditions, therefore significantly improving the strength of the alloy. (21 refs.)

120356 Ergoterm SBT—an antimony stabilizer for rigid PVC compounds. B.Wojtowicz, B.Kawinska, I.Tomaszewska (Inst. Chem. Przemyslowej, Warsaw, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.123-6 (April 1983). In Polish. [received: Oct. 1983]
The results of studies on the thermal and natural ageing stability as well as on the processing properties of rigid, transparent PVC-S compounds have been presented. These compounds have been stabilized with Ergoterm SBT, a Polish-made antimony stabilizer. The possibility of using this stabilizer in the manufacture of some rigid items from PVC, instead of the more expensive Ergoterm OTGO organotin stabilizer, has been confirmed. The stabilizing system composed of Ergoterm SBT and Ergoplast ES revealed to be the most advantageous one for this type of rigid PVC compounds. (3 refs.)

120357 The properties of equimolar copolycarbonates of bisphenol A with bisphenol S and 1,4-bis(hydroxymethyl)cyclohexane. M.Yenigul, I.W.Parsons, J.N.Hay, R.N.Haward (Dept. of Chem., Univ. of Birmingham, Birmingham, England).
Polymer (GB), vol.24, no.10, p.1313-16 (Oct. 1983).
Ranges of both alternating and random 1:1 copolycarbonates of bisphenol-A (2,2-bis(4-hydroxyphenyl)propane) and bisphenol-S (4,4'-dihydroxydiphenyl sulphone) and of bisphenol-A and 1,4-dimethanoylcyclohexane have been synthesized in order to test the hypothesis that, other things being equal, a more random structured polymer should exhibit superior thermal ageing characteristics. Studies on these materials' mechanical and thermal properties establish that within each pair they are extremely similar and hence the original hypothesis is disproved. (10 refs.)

120358 Upper-bound analysis of hot extrusion of axisymmetric rods and tubes. II. Hot extrusion of tubes. C.Teodosiu, I.Rosu, T.Dumitrescu (Dept. of Solid Mech., Inst. for the Phys. & Technol. of Materials, Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.395-411 (July-Aug. 1983).
For pt.I see ibid., vol.28, no.3, p.317 (1983). Part I was devoted to the mathematic modelling of hot extrusion by assuming an arbitrary stationary streamline pattern and taking into account the non-stationarity of the thermal field. This second part is concerned with the comparison between the upper-bound solutions obtained by using various streamline models for the hot extrusion of axisymmetric tubes. (no refs.)

120359 Electron microscopy observation and X-ray microanalysis of aged martensites in a Cu-12.9 mass% Al-2.5 mass% Mn shape memory alloy. H.Kubo, A.Miyake, K.Shimizu (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.9, p.603-12 (Sept. 1983).
Aged martensites in a Cu-12.9 mass% Al-2.5 mass% Mn shape memory alloy have been studied by means of electron microscopy and diffraction and X-ray microanalysis. On ageing an 18R martensite at 573K, very small coherent and spherical precipitates are homogeneously formed throughout the martensite. These very small precipitates are evolved by banishing Cu atoms into the martensite matrix. In accordance with such composition variance in the martensite matrix, M and A_s temperatures increase on ageing. In connection to the formation of very small precipitates, the 18R martensite gradually varies the crystal structure to a 2H one. Plate-like precipitates are also observed in the martensite matrix at early stages of ageing, which are of a DO_3 structure and rich in Al content. Orientation relationship and habit plane of the plate-like precipitates to the martensite matrix are similar to those of thermoelastic martensites to the β_1 matrix in Cu-Al alloys. At late stages of ageing, equilibrium γ phase appears in a block shape, and the plate-like precipitates with a DO_3 structure are observed in contact with the γ phase. (23 refs.)

120360 Microstructural changes near the coherent spinodal line in the Fe-Mo alloy system. T.Kozakai, T.Miyazaki (Dept. of Metall. Engng., Nagoya Inst. of Technol., Nagoya, Japan).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.9, p.633-41 (Sept. 1983).
Microstructural changes near the coherent spinodal line during ageing in Fe-18.5 and 19.2 at.% Mo alloys were investigated by means of transmission electron microscopy. A mixed microstructure of the $\langle 100\rangle$ modulated structure and the plate-shaped Mo-rich zones was observed in the alloys aged at a temperature just above the coherent spinodal temperature, T_s. With further ageing this morphological distinction became obscure, and consequently the modulated structure appeared. When the alloy was aged at a higher temperature, the plate-shaped zones were only nucleated on the $\{100\}$ matrix planes, while the ageing at a temperature just below T_s only produced a typical $\langle 100\rangle$ modulated structure. A series of results implies that the microstructures produced near T_s become continuously inhomogeneous with increasing ageing temperature, which has been proposed by Binder. (17 refs.)

120361 Structure and properties of a rapidly quenched commercial Al-Mn alloy. M.H.Rao, G.Sridhar, C.Suryanarayana (Dept. of Metall. Engng., Banaras Hindu Univ., Varanasi, India).
Z. Metallkd. (Germany), vol.74, no.9, p.585-91 (Sept. 1983).
Microstructure and mechanical properties of a melt-quenched commercial Al-Mn alloy have been investigated. The foils obtained by the combined 'gun' and 'piston-and-anvil' method are about 100 μm thick in the centre and had a microhardness value of about 480 MPa. These foils have been annealed at different temperatures and the hardness measured as a function of time. These ageing curves showed a peak value suggesting the tendency for precipitation hardening. Annealing at 573K for 10 h resulted in a maximum hardness of 620 MPa, tensile strength of 205 MPa and 0.1% proof stress of 162 MPa for this alloy. The as-quenched foils contained only a supersaturated solid solution, which was quite stable up to about 523K. Decomposition of the supersaturated solid solution at higher temperatures led to the precipitation of intermediate phases. Electron diffraction studies have identified these phases to be $Al_6(Fe,Mn)$ and α-$Al_{12}Mn_3Si$. (29 refs.)

81.40J Elasticity and anelasticity

(see also 62.20D Elastic constants, 62.40 Anelasticity, internal friction, and mechanical resonances)

120362 Anelasticity and viscoplasticity in metallic glasses. J.Haimovich, T.Egami (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.89-98 (Oct. 1983).
Low level constant-load tensile creep measurements and bend stress relaxation measurements were made on the metallic glasses $Fe_{40}Ni_{40}B_{20}$ and $Fe_{32}Ni_{36}Cr_{14}P_{12}B_6$ at various temperatures. The anelastic (recoverable) and viscoplastic (non-recoverable) components of flow were separated using pre-annealing treatments of various lengths of time, and multiple stress reversals for bend stress relaxation. The influence of the structural relaxation on the anelasticity was studied by continuous measurements of apparent viscosity. It was found that, while viscoplastic deformation drastically decreases with annealing, the anelastic behaviour is only weakly affected. The viscosity versus time curves for pre-annealed samples are shifted on the time axis with respect to those for as-quenched samples. The relaxation rates calculated from the final stages of stress relaxation are higher than those estimated for pre-annealing periods. All these findings strongly imply that the spectrum of activation energies for anelastic relaxation is very broad and little affected by thermal treatments. (24 refs.)

120363 Analysis of mechanical relaxation processes in materials based on heat-resistant polymers. Z.S.Vikhauskas, R.V.Banyavichyus, A.I.Marma, A.A.Askadskii (Antanas Snechkus Kaunas Polytech. Inst., USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.745-9 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1090-5 (Nov.-Dec. 1982). [received: Sept. 1983]
A detailed analysis of the relaxation behavior of polyoxadiazole and polyimide, promising materials for the manufacture of heat-resistant composite systems, was carried out. It is demonstrated that a relatively small set of experiments on isothermal and nonisothermal stress relaxation is sufficient to be able to assess the parameters of the relaxation processes. The mathematical expressions that correlate the relaxation processes at different stress conditions have been confirmed experimentally and can be used to predict the viscoelastic behavior of heat-resistant materials. (13 refs.)

120364 Matrix dominated properties of high performance composites. P.Yang, C.Altman, D.Taggart, L.Carlsson, S.S.Sternstein (Dept. of Materials Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.25/1-6
The out of plane mechanical properties of high performance laminates are governed by the matrix behavior. An out of plane centro-symmetric deformation test is described which is quite sensitive to matrix properties. The small strain viscoelastic properties are shown to be independent of stacking sequence and obey time-temperature superposition around the matrix glass transition. The delamination properties are shown to be dependent on stacking sequence. (6 refs.)

120365 Dynamic bulk and shear relaxations in solid polymers: relationship to deformation behavior. A.F.Yee.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.32/1-7
Dynamic bulk and shear relaxation are predictd to reduce the bulk (crazing) and shear yield stresses, respectively. Data are presented for PMMA, slow-cooled and quenched PC, and piperidine cured DGEBA epoxy. Bulk relaxation peaks of various magnitudes are found for each of the materials. Good correlation is found between the location of these bulk relaxations and low fracture toughness. (24 refs.)

120366 Thermodynamic aspects of mechanical behavior of glassy polymers. J.Moacanin, S.T.J.Peng, A.Gupta, R.F.Landel (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.34/1-6
Recent volume recovery and stress relaxation measurements were successfully interpreted in terms of free-volume fractions calculated from a theoretical equation of state of Simha and Somcynsky (see Macromolecules, vol.2, p.342, 1969). The authors were able to determine independently these free-volume fractions using ESR to measure mobility of spin probes. Inasmuch as the theoretical equation of state is derived from considerations of molecular mobility in the context of the cell theory of the solid state, these results suggest a new experimental approach toward extending the thermodynamic description of the polymer glassy state. 81.40L Deformation, plasticity and creep

(see also 62.20F Deformation and plasticity, 62.20H Creep)

120367 Mechanical characterization of sheet molding compound composites. S.K.Chaturvedi, C.T.Sun, R.L.Sierakowski (Dept. of Engng. Sci., Univ. of Florida, Gainesville, FL, USA).
Polym. Compos. (USA), vol.4, no.3, p.167-71 (July 1983).
A study was conducted to determine basic mechanical property characterization of five different sheet molding compound (SMC) materials with glass content varying from 30 to 65 percent by weight. In particular, the objectives were to find variation in their tensile, flexural, and shear properties along with some information on fabrication-induced anisotropy that may be present in these materials. The flexural properties were measured using three-point bend tests, and double-rail shear tests were conducted for in-plane shear properties. A significant scatter was observed in all the properties, and no conclusive evidence about the fabrication-induced anisotropy was found. Flexural strength of each material was found to be significantly greater than the tensile strength. Finally, some interesting features associated with their tensile and flexural failure models have also been discussed. (7 refs.)

120368 Variability in static strengths of sheet molding compounds (SMC). C.D.Shirrell (Polymers Dept., General Motors Res. Labs., Warren, MI, USA).
Polym. Compos. (USA), vol.4, no.3, p.172-9 (July 1983).
The variability in the strengths of six glass fibre-reinforced sheet molding compounds (SMC) is reported. This variability was shown not to be caused by macroscopic variations in fiber, resin, filler, or void content nor gross fiber anisotropy. Weibull statistics were used to accurately characterize this variability. Random flaw models with the flaws being distributed in the volume, surface, or edge were shown not to predict the observed static strength variability in SMC. (9 refs.)

120369 Viscoelastic and plastic relaxation of residual stresses around macroparticle reinforcements in metal matrices. P.J.Fritz, R.A.Queeney (Dept. of Engng. Sci. & Mech., Pennsylvania State Univ., University Park, PA, USA).
Composites (GB), vol.14, no.4, p.393-4 (Oct. 1983).
Equations are presented for the calculation of residual stresses generated by temperature changes in metal matrix composites. The interfacial contact pressures and plastic zone sizes for various cooling rates imposed on an Al_2O_3 sphere embedded in 355 aluminium are evaluated. The results show that stress relaxation and alloy viscosity are important factors affecting the final composite residual stress state. (8 refs.)

120370 Diffraction-contrast study of microstructure and deformation process of WC-Co cemented carbide. Lui Manlang, Huang Xiaoying, Duan Shitian, Shao Daqin, Cui Yumei, Yao Zhenmei (Central Iron & Steel Res. Inst., Min. of Metall. Industry, Beijing, China).
Int. J. Refract. & Hard Met. (GB), vol.2, no.3, p.129-32 (Sept. 1983).
The diffraction-contrast study was carried out on the commercially produced WC-12%Co cemented carbides by TEM. According to the observation of two-phase microstructure, the phase transformation process of binder in the alloy was investigated and the experiment evidences for the transformation of β-Co to stacking faults to ϵ-Co were obtained. Finally, one possible explanation was advanced for the deformation of the alloy and the propagation process of cracks. (5 refs.)

120371 Influence of the plastic deformation conditions under pressure on the structure and properties of Mo. B.I.Beresnev, V.Z.Spuskanyuk, B.M.Efros, N.B.Shishkova, G.V.Dolgikh.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.79-82 (1983). In Ukrainian.
Optical and electron microscopic methods were used to study the strength properties and structure variations in low-alloyed molybdenum deformed under pressure by different hydroextrusion methods. It is shown that pressure, temperature and velocity changes of extrusion with identical degree of deformation specify the peculiarities of the substructure and the level of microhardness obtained depending on conditions of plastic deformation under pressure. (6 refs.)

120372 A high performance wrought nickel-base superalloy EI-929. K.K.Sharma, S.N.Tewari (Defence Metall. Res. Lab., Hyderabad, India).
J. Mater. Sci. (GB), vol.18, no.10, p.2915-22 (Oct. 1983).
EI-929, a high peformance Soviet nickel-base wrought superalloy having the composition, Ni-14Co-10Cr-5W-4Mo-4Al-2Ti-0.5V-0.1C-0.02B (wt%) was prepared by vacuum induction melting and vacuum arc refining. The ingots were homogenized and hammer forged. The microstructural inhomogeneities in the forged product were examined. Tensile and stress-rupture properties, and fracture behaviour were observed to vary between the central and the outer portion of the forged stock. (5 refs.)

120373 Creep of Kevlar 49 fibre and a Kevlar 49-cement composite. P.L.Walton, A.J.Majumdar (Dept. of the Environment Building Res. Station, Garston, Watford, England).
J. Mater. Sci. (GB), vol.18, no.10, p.2939-46 (Oct. 1983).
The creep strain responses of Kevlar 49 fibres and a Kevlar 49-cement mortar composite board to sustained stresses have been studied over an extended period in excess of four years at ambient temperature. Single filaments of Kevlar 49900 mm in length, were stressed in tension in the range 830 to 1830 MPa. The relationship between creep and elapsed time is represented by the power function At^n where A is a function of stress and n is a constant. The

creep strain in Kevlar 49 was low compared with other polymers. For example after 1000 days at a stress of 1830 MPa the creep strain was 13% of the initial elastic strain and is predicted by the power function to increase to 14.6% after 4000 days. The Kevlar 49-mortar composite was subjected to bending stresses in the range 6 to 35 MPa and the creep deflection was monitored. (16 refs.)

120374 High temperature compressive behaviour of as-cast Al-Cu alloys of varying composition. G.A.Nassef, M.Suery (Lab. de Genie Physique et Mecanique des Materiaux, INPG-IEG, Domaine Univ., Saint-Martin-d'Heres, France).
J. Mater. Sci. (GB), vol.18, no.10, p.3031-40 (Oct. 1983).
Al-Cu alloys with different copper contents ranging from 10 to 45 wt% were deformed in compression in the as-cast condition. Measurements of the strain-rate sensitivity parameter m using the crosshead speed jump technique show that alloys of composition close to the eutectic become superplastic after about 25% strain, with m increasing from about 0.2 at the beginning of deformation to about 0.5 or more, depending on composition. This transition to the superplastic state is accompanied by an important decrease of the flow stress during compression and it is associated by the breakdown of the initially lamellar structure of the eutectic phase in the highly deformed regions of the specimen. Moreover for the alloy with 37 wt.% copper, the transition corresponds also to the degeneration of the dendritic primary phase and this alloy shows a particularly high value of m and a low steady state flow stress in spite of the large volume fraction of the hard $CuAl_2$ compound. (18 refs.)

120375 The mechanical properties of PVC under high pressure. J.Yuan, A.Hiltner, E.Baer (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).
J. Mater. Sci. (GB), vol.18, no.10, p.3063-71 (Oct. 1983).
The deformation properties of PVC have been studied under high pressure. Craze initiation and yield criteria have been proposed. The brittle-to-ductile transition was observed between 1×10^7 and 2×10^7 Pa, which is a relatively low transition pressure compared to polystyrene. Deformation in the post-yield region occurred by neck formation and subsequent drawing to produce chain orientation. When PVC was exposed to the pressure-transmitting fluid, silicon oil, a strong environmental stress cracking effect was observed. (38 refs.)

120376 Characterization of creep cavitation in sintered alumina by small-angle neutron scattering. R.A.Page, J.Lankford (Southwest Res. Inst., San Antonio, TX, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.146-8 (Aug. 1983).
Small-angle neutron scattering experiments were performed on compression-crept alumina. The results suggest that grain-boundary cavities on the order of 100 nm in diameter, probably are present initially. For compression strains up to 8%, the average cavity size changes very little. However, the cavity density approximately triples, and it appears that the cavities become elongated in the direction of the compression axis. (16 refs.)

120377 The mechanical properties of cellular solids. M.F.Ashby.
Metall. Trans. A (USA), vol.14A, no.9, p.1755-69 (Sept. 1983).
The mechanical properties (elastic, plastic, creep, and fracture) of cellular solids or foams are related to the properties of the cell wall material and to the cell geometry. The properties are well described by simple formulae. Such materials occur widely in nature and have many potential engineering applications. (42 refs.)

120378 Influence of nonsteady state behavior on superplastic deformation of a 25.7 Cr-6.6 Ni stainless steel. B.P.Kashyap, A.K.Mukherjee (Dept. of Mech. Engng., Univ. of California, Davis, CA, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1875-82 (Sept. 1983).
Superplastic behavior of a microduplex stainless steel (IN744) was studied by deforming specimens with initially elongated grains. As a result of deformation, grain growth and breaking up of elongated grains were noticed to occur concurrently. These microstructural instabilities result in strain hardening or strain softening, respectively. This then leads to nonuniqueness in the flow behavior. Some examples of nonuniqueness in stress-strain rate relation include the presence of: strength anisotropy, increase in strain rate sensitivity, constant stress level for varying grain size, and two distinct stress-strain rate curves over comparable test condition for the same initial microstructure. These have been explained by the concomitant microstructural changes and the influence of such changes on instantaneous flow stress. Emphasis is made on the need to eliminate microstructural instability in order to characterize the deformation phenomena under steady state. (21 refs.)

120379 Microstructure and mechanical properties of Zn-Al alloys at room temperature. J.Negrete (Inst. de Geologia y Metalurgia, Univ. Autonoma de San Luis Potosi, San Luis Potosi, Mexico), L.Valdes, G.Torres-Villasenor.
Metall. Trans. A (USA), vol.14A, no.9, p.1931-4 (Sept. 1983).
Examines some of the mechanical properties of Zn-Al alloys in the composition range 60 to 85 wt.% Zn at room temperature after ice-water quenching, air cooling, and slow cooling of the alloys. These alloys in the quenched condition show superplastic behavior at high temperatures. (6 refs.)

120380 Experimental investigation of the stability of fiberglass cylindrical shells subject to prolonged application of twisting moments. V.M.Leizerakh, S.V.Sekletov (Moscow Power Engng. Inst., Moscow, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.692-6 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1029-33 (Nov.-Dec. 1982). [received: Sept. 1983]
Torsional testing was conducted of shells fabricated from a T-13 linen-interweave glass fabric. The fabric was impregnated with an EP-5122 binder, whose content was maintained in the range of 31-32%. A 300-mm-wide strip was wound under low tension on a steel mandrel heated to 120°C and coated with Teflon. The shell was placed in a thermostat on the mandrel, where it was polymerized at 120±3°C. The thermostat was then disengaged, and the shell remained in it on the mandrel. The mechanical characteristics of the finished-shell material were determined by testing circular specimens. (3 refs.)

120381 The effect of physical ageing on the properties of poly(ethylene terephthalate). A.Aref-Azar, F.Biddlestone, J.N.Hay, R.N.Haward (Dept. of Chem., Univ. of Birmingham, Birmingham, England).
Polymer (GB), vol.24, no.10, p.1245-51 (Oct. 1983).
Physical ageing rates of poly(ethylene terephthalate) have been measured, and ageing is interpreted to be associated with the conventional glass formation process, which occurs at a more rapid rate at higher temperatures. Ageing is accompanied by a marked change in mechanical properties, increased tensile yield stress and drawing stress, more localized yielding of the polymer and a marked decrease in impact strength. The fracture results have been attributed to the increased yield stress and a change in contribution of plane stress and plane strain conditions in the samples. Fracture surfaces show evidence of mixed modes of fracture. (29 refs.)

120382 Polyurethane microcellular elastomers. I. Effect of chemical composition on tensile strength and elongation at break of poly(ethylene-butylene adipate) based systems. T.Korodi, N.Marcu (Intreprinderea de Spume Poliuretanice, Timisoara, Rumania).
Polymer (GB), vol.24, no.10, p.1321-6 (Oct. 1983).
The relationships between tensile strength and elongation at break and the chemical composition of a microcellular elastomer used in shoe sole technology have been calculated using multiple linear regression analysis. Using the statistical Student's test, the importance of the factors that influence the above characteristics have been established. It has been found that the moulded density has the major influence on the tensile strength while the elongation at break depends to a great extent on the hard-segment dispersion into the soft matrix, as indicated by the influence of the water contents and the quasi-prepolymer index (I_{NCO}). Hydroxyl number in the usual range of 52-61 mg KOH/g has no influence on the above characteristics. (22 refs.)

120383 Deformation and fracture behaviour of a rubber-toughened epoxy. I. Microstructure and fracture studies. A.J.Kinloch, S.J.Shaw, D.A.Tod (Ministry of Defence, Propellants, Explosives & Rocket Motor Establ., Waltham Abbey, England), D.L.Hunston.
Polymer (GB), vol.24, no.10, p.1341-54 (Oct. 1983).
The microstructure and fracture behaviour of an unmodified and a rubber-modified epoxy have been studied. Values of the stress intensity factor, K_{Ic}, at the onset of crack growth, the type of crack growth, and the detailed nature of the associated fracture surfaces have been ascertained. Both materials exhibit essentially the same types of crack growth but the values of K_{Ic}, for the rubber-modified material were usually significantly higher than those for the unmodified epoxy. The mechanisms for this increased toughness have been considered and a mechanism that accounts for all the observed characteristics has been proposed. (47 refs.)

120384 Deformation and fracture behaviour of a rubber-toughened epoxy. II. Failure criteria. A.J.Kinloch, S.J.Shaw (Ministry of Defence, Propellants, Explosives & Rocket Motor Establ., Waltham Abbey, England), D.L.Hunston.
Polymer (GB), vol.24, no.10, p.1355-63 (Oct. 1983).
For pt.I see ibid., vol.24, no.10, p.1341-54 (1983). The microstructure and fracture characteristics of a rubber-modified epoxy, and for comparison that of the unmodified epoxy, were previously examined in detail. Based on this analysis a qualitative mechanism involving cavitation, shear yielding and plastic flow was proposed. As an extension of this work, the present paper considers the yield behaviour of the epoxy material and uses the data determined, together with the previously reported fracture results, to calculate values of the crack opening displacement. The rate/temperature dependence of the crack opening displacement and the correlations established between stress intensity factor, K_{Ic}, yield stress and type of crack growth suggest that the extent of crack tip blunting largely governs the relative toughness of the epoxy materials and induces transitions in the types of crack growth observed. A quantitative expression is then presented which successfully describes the fracture toughness values over a wide range of temperatures and rates. The two parameters in this expression are shown to be material constants and therefore provide a unique failure criterion. They can be viewed simply as curve-fitting parameters but they may also have some significance in terms of a critical stress that must act over a critical distance ahead of the crack tip to produce crack growth. (39 refs.)

120385 Theory of pseudo cross-link. III. Rheological behavior. J.Furukawa (Dept. of Appl. Chem., Aichi Inst. of Technol., Toyota, Japan).
Polym. Bull. (Germany), vol.10, no.7-8, p.336-42 (Sept. 1983).
Stress-relaxation, creep and stress-strain relations are discussed in terms of pseudo cross-link concept. The decrease of cross-links by the stress or strain leads to an equation similar to the Mooney-Rivlin equation. Viscous flow is also an important factor decreasing the cross-sectional area of the specimen and the chain-extension. Viscosity considerably decreases with an increasing rate of extension and temperature. The filler ingredient plays roles of not only enchancing the chain strain but also providing the pseudo cross-link due to adsorption of the rubber on the filler surface. (3 refs.)

120386 Resistance to deformation of pressed strips from granulated alloys. Yu.A.Gorbunov, I.G.Rusov, V.I.Krainov, V.A.Kir'yanov (Krasnoyarsk Inst. of Nonferrous Metals, Krasnoyarsk, USSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.90-4 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.18-22 (Feb. 1983). [received: Sept. 1983]
The resistance to deformation of granulated aluminum alloys was studied by a method consisting of compressing cylindrical specimens in a hydraulic press. Specimens for testing were machined from strips produced by pressing granules in industrial presses of various capacities. Compression in the press was performed at rates of deformation of up to 1 sec^{-1}. During compression the work of deformation resulted in adiabatic heating of the specimen. Measurements, made with a caulked-in thermocouple, showed that the temperature of granulated aluminum alloys could rise during compression by up to 50°C. (4 refs.)

120387 Influence of deformation on the structure of matrix of compositional material. Yu.K.Glotova, I.I.Bugakov, I.I.Demidova, V.I.Irzhak, B.A.Rozenberg.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1938-43 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
For epoxide resin with introduced strained macroincorporations of various shape the influence of the state of the filler on the stress in the matrix has been studied. The stresses acting immediately during formation of compositional material are shown to affect the structure of the matrix. (3 refs.)

120388 Mechanical properties of Cr-Ni steels and alloys after testing in N_2O_4. A.N.Lapin, A.R.Zakharov, D.A.Chistyakov, V.P.Gol'tsev, S.V.Prisedskii, V.F.Korotov, E.E.Fedyushin.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.24-8 (1983). In Russian.
The effect of N_2O_4 on transitional stress-strain characteristics of high-nickel alloys and chromium-nickel steels at temperatures ranging from 120 to 650°C has been investigated. (11 refs.)

120389 Study of the effect of circumferential temperature variations on fuel-sheath strain in an inert atmosphere. J.Ferner, R.K.Rondeau, H.E.Rosinger.
Report AECL-7789, Atomic Energy Canada Ltd., Chalk River, Ont. (July 1983), 31 pp.
A failure model for Zircaloy-4 fuel sheaths has been developed and used to predict the effect of circumferential temperature variations (ΔT) on fuel-sheath strain behaviour in an inert atmosphere. In addition, experimental data were generated for fuel-sheath failures in the α- and $(\alpha+\beta)$-phase regions and compared to the predictions of the model. For both the experimental data and the model predictions it was found that increasing ΔT decreases sheath strain. Most of the reduction in burst strain with increasing ΔT occurs in the first 15K to 20K. For high ΔT values, burst strains in the α- and $(\alpha+\beta)$-

phase regions tend to an asymptotic value in the range 5 to 20%, irrespective of both heating rate and circumferential temperature variation. (16 refs.)

120390 Tensile and flexural properties of fibers of an extended chain polymer. S.R.Allen, A.G.Filippov, R.J.Farris, E.L.Thomas.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.1/1-6
The mechanical behavior of poly-(p-phenylene benzobisthiazole) fibers has been studied in tensile, bending and torsional experiments. These fibers exhibit tensile moduli of 100-300 GPa with strengths of 1-3.3 GPa depending on processing conditions and the resulting degree of molecular order. Torsional and bending experiments demonstrate the mechanical anisotropy resulting from the very high molecular orientation of the rod-like molecules along the fiber axis. X-ray diffraction studies indicate the importance of the degree of lateral molecular ordering on PBT fiber properties, particularly the tensile and shear strengths of the fibers. (7 refs.)

120391 Some microlocal effects of mechanical loading on the crystalline lamellae in bulk high density polyethylene. W.Rose, C.Meurer.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.3/1-6
Lamellar crystals in semicrystalline polymers react to mechanical loading in a characteristic manner. In high density polyethylene the modifications caused by the deformation could be made visible with a high resolution using the transmission electron microscope. Shear zones, kinks, intersections of shear zones and similar were successfully demonstrated as discrete deformation elements within the structure. Selected electronmicrographs show that the method is very well suited to describe local deformation qualitatively. (3 refs.)

120392 High-temperature thermoviscoelasticity of drawn poly(ethylene terephthalate). C.P.Buckley, D.R.Salem, M.E.Sikorski (Univ. of Manchester Inst. Sci. of Technol., Manchester, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.4/1-5
Thermoviscoelasticity of drawn poly(ethylene terephthalate) fibres has been studied between room temperature and the melting region. Specifically, the recovery from small strain setting in torsion was measured, for fibres with various thermal treatments. In addition to the glass transition (I), another, higher temperature, relaxation process (II) was found in heat-treated fibres, separated from I by a distinct plateau. Both the plateau height and the temperature/time position of II are sensitive to details of the thermal history. The behaviour of II is believed to reflect varying degrees of crystal constraint on the amorphous fraction. (5 refs.)

120393 SANS investigation of molecular conformation in shear bands, as related to yield mechanisms in glassy polymers. J.M.Lefebvre, B.Escaig.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.5/1-5
Small angle neutron scattering experiments on plastically deformed polystyrene (PS) and polymethylmethacrylate (PMMA) allows us to characterize chain deformation for samples having undergone various temperature and constant strain-rate compression conditions. (2 refs.)

120394 Self consistent field calculations of internal conformational states in glassy polymers. J.T.Bendler (General Electric Co., Schenectady, NY, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.7/1-6
Internal conformational transitions in structural subunits of a polymer chain cause the subunit to populate states of varying sizes and shapes. The atomic rearrangements may be described in terms of a molecular strain tensor which responds to stresses when the polymer is in the glassy state. Self consistent field calculations, both empirical and quantum mechanical, are used to calculate energetic and structural changes for model compounds related to polycyclohexylmethacrylate and polycarbonate. The strength of the bulk and shear loss peaks resulting from transitions in the model compounds cyclohexyltrimethylacetate and diphenyl carbonate are estimated. (10 refs.)

120395 The influence of branch length on the deformation and microstructure of polyethylene. R.A.Bubeck, H.M.Baker (Dow Chem. Co., Midland, MI, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.31/1-6
Side chain branching has a profound influence on the microstructure and properties of polyethylene (PE). For a series of linear PE copolymers environmental stress crack resistance (ESCR), melting points, creep resistance and modulus, and equilibrium spherulite size were all found to increase with increasing branch length (methyl to hexyl) at a given density and molecular weight. It is proposed that at a fixed molecular weight, branch length and concentration determine spherulite size and, consequently, boundary area, in which the dry crazing/voiding occurs during the incubation period of ESC. At a fixed density, decreased spherulite size contributes to greater boundary slip and increased creep at low stresses. (8 refs.)

120396 Internal stress and distortion in injection mouldings. K.Thomas, D.Dawson, W.J.Greenwood, J.R.White, C.S.Hindle, M.Thompson (Dept. of Metall. & Materials, Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.37/1-6
Post-moulding distortion and residual stress distributions in injection-moulded plaques of polypropylene (PP) and short glass fibre-filled polypropylene (GFPP) have been compared. GFPP mouldings showed greater distortion and contained stresses of higher magnitude. The rate of relaxation of the residual stresses was greater in PP than in GFPP. The tendency to distort was found to be influenced by the gate size. Distortion was greater in mouldings produced with the platens at different temperatures but the residual stresses were not very different. Post-moulding conditioning in a temperature gradient caused distortion to develop rapidly and significantly modified the residual stress distribution with polystyrene bars. (17 refs.)

81.40N Fatigue, embrittlement, and fracture

(inc. hardness; see also 62.20M Fatigue, brittleness, fracture and cracks)

120397 On the stress distribution in ceramo-metallic composite beams and the occurrence of transverse cracks in the ceramic overlay. J.Lenz (Inst. fur Theoretische Mech., Univ. Karlsruhe, Karlsruhe, Germany).
CFI-Ceram. Forum Int. Ber. Dtsch. Keram. Ges. (Germany), vol.60, no.7, p.237-43 (19 Sept. 1983). In German, English.
The strength properties of ceramic-coated metal parts are frequently tested in three-point bending experiments. For such bending samples the distribution of stresses is determined. Once the stresses are known, a simple criterion—transgression of the ceramic's flexural strength—may serve in estimating the external load at which transverse cracks will occur in the ceramic. It is shown that the ceramic overlay (veneer) must be as thin as possible and that the metal must have as high a modulus of elasticity as possible in order to avoid cracking. The failure loads calculated with this fracture criterion coincide well with the results of experiments conducted on dental composites. (13 refs.)

120398 Cryogenic temperature near-threshold fatigue crack growth rate data for JBK-75 stainless steel. P.K.Liaw, W.A.Logsdon, M.H.Attaar (Materials Engng. Dept., Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA).

Cryogenics (GB), vol.23, no.10, p.523-6 (Oct. 1983).

An important structural component of the Westinghouse Large Coil Programme superconducting magnet is the JBK-75 (modified Ad-286) stainless steel conductor sheath. Because the presence of pre-existing cracks or flaws in the conductor sheath is a potential possibility, the structural reliability of the conductor sheath would be enhanced if a threshold level of stress intensity range (ΔK_{th}) was established below which fatigue crack growth would not occur. Consequently, near-threshold fatigue growth rate data were generated at two load ratios on JBK-75 stainless steel at room and cryogenic temperatures. No load ratio effect on near-threshold fatigue crack growth rate was observed at cryogenic temperatures. (20 refs.)

120399 Failure mechanism discrimination in carbon fibre-reinforced epoxy composites. D.Valentin, P.Bonniau, A.R.Bunsell (Ecole Nat. Superieure des Mines de Paris, Eury, France).

Composites (GB), vol.14, no.4, p.345-51 (Oct. 1983).

To examine the possibility of discriminating between the various failure mechanisms which occur in carbon fibre-reinforced epoxy composites, unidirectional and crossplied specimens have been loaded to failure at various angles with respect to the fibre direction. The mechanisms which dominate the failure of unidirectional specimens under these loading conditions are known and the results have been compared with the amplitude of the acoustic signals recorded during loading. High amplitude signals were seen to originate from cracking of the matrix parallel to the fibres, whereas low amplitude signals were recorded from fibre breaks. These results have permitted an interpretation of the failure processes occurring in crossplied specimens. (8 refs.)

120400 On the increasing fracture toughness at increasing notch length of 0/90 and 0/±45/0 graphite/epoxy laminates. P.W.M.Peters (DFVLR, Koln, Germany).

Composites (GB), vol.14, no.4, p.365-9 (Oct. 1983).

Fracture mechanics applied to conventional materials successfully considers the size of the plastic zone. However, no fracture model for composites exists which implicitly considers the damage zone size at notch tips. An approach is made to estimate the influence of the damage zone size on the notch-length dependent fracture toughness of 0/90 and 0/±45/0 graphite/epoxy laminates. (13 refs.)

120401 Impact behaviour of tungsten carbide-cobalt alloys. F.Osterstock (Equipe Materiaux-Microstructure, Lab. de Cristallographie, Chimie et Physique des Solides, ISMRA, Univ. Caen, Caen, France).

Int. J. Refract. & Hard Met. (GB), vol.2, no.3, p.116-20 (Sept. 1983).

The impact behaviour of some tungsten carbide-cobalt alloys was studied. Three experimental approaches were used: pendulum, drop weight test with bending fixture, splitting using drop weight test and specimens on flat support. In the two former cases special attention was given to the comparison with the breaking parameters from static three point bending measurements. In this respect, a factor k=Udyn/U stat was introduced and its evolution with material and experimental parameters examined. The values of k are always higher than 1 and may reach 3. This variation of k with the impact parameters puts into evidence the importance of the impacting weight and the appearance of local plasticity in the energy consumption. This latter aspect is confirmed by the splitting experiments. (25 refs.)

120402 On a search for epsilon crack tip plastic zones in the fatigue of amorphous polymers. M.T.Takemori, R.P.Kambour, D.S.Matsumoto (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).

Polym. Commun. (GB), vol.24, no.10, p.297-9 (Oct. 1983).

Epsilon plastic zones have been found at fatigue crack tips in four of the twelve glassy polymers tested to date: BPA polycarbonate, poly(phenylsulphone), BPA polyarylate, and BPA poly(estercarbonate). These resins all have high positions in a table of glassy polymers ranked in terms of the ratio of crazing resistance to shear flow resistance. (9 refs.)

120403 Study of the relationship between fracture toughness (J_{IC}) and bulge ductility. M.R.Bayoumi, M.N.Bassim (Dept. of Mech. Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada).

Int. J. Fract. (Netherlands), vol.23, no.1, p.71-9 (Sept. 1983).

A theoretical model relating fracture toughness expressed as J_{IC} and bulge ductility $\epsilon_{f,\alpha=1,\beta=0}$ for a material exhibiting linear elastic behavior at low temperature and elastic-plastic behavior at higher temperatures is proposed. This model shows a variation of J_{IC} with $\epsilon_{f,\alpha=1,\beta=0}{}^2$ for linear elastic behavior and J_{IC} with $\epsilon_{f,\alpha=1,\beta=0}$ for elastic-plastic behavior. The model contains three constants to be determined experimentally for a given material, specimen geometry and testing conditions. A case study on 1045 steel in the temperature range −60 to 25°C confirms the validity of the model. The experimental results help in determining the size of the fracture zone ahead of the crack as well as the mechanisms for crack blunting and crack growth. (16 refs.)

120404 Molecular dynamics simulation of crack tip processes in alpha-iron and copper. B.deCelis (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA), A.S.Argon, S.Yip.

J. Appl. Phys. (USA), vol.54, no.9, p.4864-78 (Sept. 1983).

The intrinsic crack tip processes of either propagation by cleavage or blunting by the nucleation of dislocations from the nonlinearly stressed region at the crack tip have been simulated by a molecular dynamics approach in alpha-iron and in copper, utilizing the Johnson and Morse potentials, respectively, and a new fixed stress boundary condition at the border between the inner discrete region and the outer anisotropic linear continuum. The simulations showed that alpha-iron is inherently brittle, and fails by cleavage along a cube plane when the stress intensity factor reaches the critical Griffith value. No dislocations are nucleated in iron and even the development of restricted crack tip twinning in special orientations does not alter this intrinsic brittleness. In copper crack tip blunting at a level somewhat less than the Griffith stress intensity factor always prevented brittle crack growth by cleavage. Thus, copper is inherently ductile. Because it permitted the unhindered development of substantial nonlinear crack tip displacements, and did not prevent dislocations from penetrating through the border between the inner nonlinear material and the outer linear continuum, the new stress boundary condition was found to be far superior to the fixed or flexible boundary conditions used at this border by previous investigators. This is reflected in the observed critical stress intensity factors for brittle cleavage that were found to be nearly equal to the expected Griffith value for the stress boundary condition while the displacement boundary conditions gave results nearly three times higher. (31 refs.)

120405 Statistical analysis of multiple fracture in 0°/90°/0° glass fibre/epoxy resin laminates. P.W.Manders, T.-W.Chou (Dept. of Mech. & Aerospace Engng., Univ. of Delaware, Newark, DE, USA), F.R.Jones, J.W.Rock.

J. Mater. Sci. (GB), vol.18, no.10, p.2876-89 (Oct. 1983).

Measurements of the distributions of crack spacings developed in the 90° ply of 0°/90°/0° glass fibre/epoxy resin laminates under tensile loading show that the ply has a variable strength. As a consequence the strain at which cracking begins is very dependent on the specimen length. The observed distributions of crack spacing are not consistent with the assumption of a uniform strength for the 90° ply. A statistical model provides a good description of the cracking behaviour particularly when the cracks are widely spaced. Magnification of the stress in the matrix between the relatively stiff glass fibres leads to debonding which is observed as a reversible 'stress-whitening'. The distributions reveal a lower probability of crack formation in the understressed region close to the existing cracks and provide estimates of the size of this region. The method of analysis can be applied to many systems which exhibit multiple fracture. (18 refs.)

120406 Compression fracture statistics of compacted cement cylinders. P.Kittl, R.Aldunate (Inst. de Investigaciones y Ensayes de Materiales, Univ. de Chile, Santiago, Chile).

J. Mater. Sci. (GB), vol.18, no.10, p.2947-50 (Oct. 1983).

A statistical analysis of the compression fracture stress of compacted cement paste cylinders was made by comparison of normal, logarithmic normal and Weibull distributions. The influence of specimen size on the fracture stress was determined and compared with predictions based on crack propagation results. The results of the analysis show that the Weibull modified statistics fit in very well with the behaviour observed. (5 refs.)

120407 Macroscopic fracture surface energy of unidirectional metal matrix composites: experiment and theory. M.Taya, A.Daimaru (Dept. of Mech. & Aerospace Engng., Univ. of Delaware, Newark, DE, USA).

J. Mater. Sci. (GB), vol.18, no.10, p.3105-16 (Oct. 1983).

A method of measuring the macroscopic fracture surface energy γ_F is studied and its verification is made compared with the theoretical prediction. Metal matrix composites used in the experiment are unidirectional graphite fibre-reinforced 6061 aluminium. A good agreement between the experimental and theoretical results is obtained. (14 refs.)

120408 A new statistical model of the hydrogen embrittlement of steel. T.H.Grundy, T.J.Davies, D.A.Ryder (Dept. of Metall., Univ. of Manchester, Manchester, England).

J. Mater. Sci. (GB), vol.18, no.10, p.3128-36 (Oct. 1983).

The hydrogen embrittlement of a hardened and tempered plain carbon, eutectoid steel of 1930 MN m^{-2} tensile strength has been studied. Plain, unnotched specimens were electrolytically charged with hydrogen and then subjected to tensile tests and delayed failure tests at constant load. The test results showed a scatter characteristic of a stochastic process and it is shown that the distribution can be described by a modified form of the Weibull probability function. Fractographic results are reported which show that fracture initiated internally at oxide inclusions and it is suggested that the embrittlement can be explained by a pressure mechanism. (8 refs.)

120409 Statistical study of thermal shock damage of a borosilicate glass. M.Ashizuka, T.E.Easler, R.C.Bradt (Dept. of Materials Sci. & Engng., Pennsylvania State Univ., University Park, PA, USA).

J. Am. Ceram. Soc. (USA), vol.66, no.8, p.542-50 (Aug. 1983).

The statistical aspects of thermal shock damage were addressed by examining the strength distributions of quenched specimens. It was observed that slow crack growth effects were minor, and that severe damage commenced near K_{Ic}. The increased range of retained strengths observed after thermal shock occurs because the low-strength portion of the distribution experiences the initial thermal shock damage. Crack arrest in the damaged specimens, examined by an energy balance, indicated that a large number of surface flaws actively extend during the initial stages of thermal shock damage. (30 refs.)

120410 Measurement of dynamic hardness by controlled sharp-projectile impact. D.B.Marshall, A.G.Evans (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA), Z.Nisenholz.

J. Am. Ceram. Soc. (USA), vol.66, no.8, p.580-5 (Aug. 1983).

Impact of ZnS by a pyramidal projectile was used to provide a measurement of the dynamic hardness and to obtain direct comparison of the contact damage produced by static loading and impact. The dynamic hardness was evaluated from measurements of residual contact dimensions as a function of impact velocity, over the velocity range 5 to 40 $m.s^{-1}$. The value obtained (H_d=5.0 GPa) was higher than the static hardness (H_s=1.9 GPa). The higher hardness in impact causes more extensive cracking, an increase in the elastic recovery of the depth of the residual contact impression, and a smaller plastic zone surrounding the contact site. The relative extents of cracking in impact and static loading are predicted by a quasi-static indentation fracture mechanics analysis along with the appropriate values of hardness. (22 refs.)

120411 Mechanical properties of fine-grained substoichiometric titanium carbide. D.B.Miracle, H.A.Lipsitt (Air Force Wright Aeronaut. Labs., Wright-Patterson Air Force Base, OH, USA).

J. Am. Ceram. Soc. (USA), vol.66, no.8, p.592-7 (Aug. 1983).

An attempt was made to lower the ductile-to-brittle transition temperature (DBTT) of polycrystalline TiC and to prevent the premature intergranular fracture noted in stoichiometric TiC at high temperatures by producing four substoichiometric compositions chosen from the single-phase TiC phase field. Each desired composition was prepared by blending and vacuum hot-pressing the appropriate mixture of Ti powder and stoichiometric TiC powder. Each billet was characterized for density, hardness, lattice parameter, and microstructure. The actual bulk compositions were determined by averaging electron probe microanalysis data collected randomly from a polished section of each billet. Specimens cut from the billets were strength-tested in four-point bending from room temperature to 1400°C and in compression from room temperature to 1200°C. A qualitative determination of the material's ductility was obtained from a load vs. deflection plot and by optical microscopy of polished surfaces after deformation. Both the hardness and strength dropped with decreasing C/Ti atom ratios. Billets produced at the lower C/Ti atom ratios showed a significant deviation from linearity of the load/deflection curve at temperatures as low as 1200°C in bending, with little or no drop in strength, and as low as 600°C in compression. (16 refs.)

120412 Strength retention in SiC ceramics after long-term oxidation. P.F.Becher (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

J. Am. Ceram. Soc. (USA), vol.66, no.8, p.120-1 (Aug. 1983).

The room-temperature flexural strengths of SiC ceramics change with increasing oxidation time at 1200°C. When certain impurities (e.g. alumina, WC, and possibly others) are present, the strength continuously decreases ≈50% after 4500 h because of subsurface pit formation. materials containing B and C or Si exhibit strength increases (≥40% after 4500 h). Surface oxide growth rates substantially decrease at times $\geq$1850 h, which corresponds to an increase in cristobalite formation. (7 refs.)

120413 Quantitative correlation of acoustic emission to the brittle fracture of porous sintered glass. R.Knehans, R.Steinbrech, W.Schaarwachter (Lehrstuhl fur Werkstoffwissenschaften A, Univ. Dortmund, Dortmund, Germany).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.17-22 (Oct. 1983).
Acoustic emission (AE) of a burst type was monitored during controlled slow crack growth in porous sintered glass of five different mean grain sizes (17-530 μm). The AE signals of crack progression in specimens of two geometries (three-point bending and double-torsion specimens) were measured with two different sensors and were analysed to correlate quantitatively the acoustic events to the structural parameters and crack kinetics. Independent of the crack geometry and for each sintered glass batch, the number and rate of events were proportional to the fractured area and crack velocity respectively. The total number of registered events depends on the sensitivity of the AE sensors and their location. Yet both sensors yield a linear relation between grain diameter and events per grain. The AE results suggest that fracture in fine (17 μm) grains occurs in almost one crack step whereas several partial crack steps are necessary in larger grains. This mechanistic model is confirmed using scanning electron microscopy observations of the fracture surfaces. (7 refs.)

120414 Hydrogen embrittlement of three metallic glasses. T.K.G.Namboodhiri, T.A.Ramesh, G.Singh, S.Sehgal (Dept. of Metall. Engng., Banaras Hindu Univ., Varanasi, India).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.23-9 (Oct. 1983).
Slow strain rate tensile tests and scanning electron fractography were used to evaluate the hydrogen embrittlement of three metallic glasses, $Ni_{40}Fe_{40}B_{20}$, $Ni_{39}Fe_{39}Mo_4Si_6B_{12}$ and $Ni_{40}Fe_6Co_{20}Cr_{12}Mo_6B_{16}$. The cathodic polarization in 0.1 N H_2SO_4 of these alloys reduced their fracture strengths and produced brittle fracture. With increasing cathodic current density the fracture stress decreased and reached a plateau value of 20%-40% of the fracture stress in air. Fractography revealed the presence of a translucent film on the ductile fracture surfaces which was probably formed by incipient melting of the shear band during the final fracture stage. A large number of microvoids of various sizes were observed on the hydrogen-embrittled fracture surfaces which may have nucleated because of hydrogen. The present results support the mechanism of ductile fracture proposed by Takayama and Maddin (1976) for metallic glasses. (20 refs.)

120415 Effects of metallurgical variables on hydrogen embrittlement in AISI type 316, 321 and 347 stainless steels. P.Rozenak, D.Eliezer (Dept. of Materials Engng., Ben Gurion Univ. of the Negev, Beer-Sheva, Israel).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.31-41 (Oct. 1983).
The hydrogen embrittlement of AISI type 316, 321 and 347 austenitic stainless steels was studied by charging thin tensile specimens with hydrogen through cathodic polarization. Throughout this study the authors compared solution-annealed samples of various prior austenite grain sizes with samples given the additional sensitization treatment. The results show that a finer grain size improves the resistance to hydrogen cracking regardless of the failure mode. Examination of the fracture surfaces of coarse-grained specimens tested while cathodically charged shows considerable differences between the annealed and the sensitized specimens. The sensitized specimens were predominantly intergranular, while the annealed specimens had massive regions of microvoid coalescence producing ductile rupture. AISI type 347 stainless steel is much more susceptible to hydrogen embrittlement than AISI type 321 steel is, and AISI type 316 steel is the most resistant to hydrogen embrittlement. The practical implications of the experimental conclusions are discussed. (29 refs.)

120416 Study of the effect of heat treatment on low cycle fatigue in AISI 4340 steel by acoustic emission. M.Houssny-Emam, M.N.Bassim (Dept. of Mech. Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.79-88 (Oct. 1983).
The effect of prior heat treatment on the mechanical properties, namely the characteristics of plastic deformation crack initiation and crack propagation, in the low cycle fatigue of AISI 4340 steel was investigated. Also studied was the effect of the changes in microstructure due to heat treating on the fatigue properties using electron microscop. Simultaneously, during fatigue tests, acoustic emission was used to determine the extent of fatigue damage in this steel as well as the onset of crack initiation. The results show that, for this material, softening takes place in the first few cycles for all values of hardness. This softening is correlated to the acoustic emission activity detected as well as to the changes in hardness due to the different heat treatments. Mechanisms for explaining the effect of heat treatment on fatigue crack initiation as well as acoustic emission are discussed. (17 refs.)

120417 Fracture toughness of fibre reinforced composite materials. A.Madronero de la Cal (Dept. de Estructuras y Materiales Estructurales, INTA, Madrid, Spain).
Metal. & Electr. (Spain), vol.47, no.546, p.91-102 (June 1983). In Spanish.
Discusses the possibility of using linear analysis of fracture toughness for fibre reinforced composite materials. A calculation routine is developed in order to establish what type of composite configurations lead to structures with the necessary elastic modulus, work of fracture and critical stress concentration factor, testing three point bending beam specimens. In the event that a specimen with no null coupling coefficients must be used, the elastic modulus under tension must be measured via ultrasonic wave velocity, and, using numerical methods, the elastic bending modulus could be determined. (no refs.)

120418 Relationships between fatigue resistance and spheroidization of graphite in nodular cast iron. R.L.Colombo, L.Bonello (IVECO Labs., Torino, Italy).
Metallography (USA), vol.16, no.3, p.327-30 (Sept. 1983).
A study was carried out on the notch sensitivity of fully spheroidized and incompletely spheroidized nodular cast iron. The data spread for the incompletely spheroidized material is consistently larger than that for the completely spheroidized material. However, of more importance is that the fatigue strength reduction factor is calculated to be 1.28 for the former, compared with 1.51 for the latter. This confirms the low notch sensitivity of the vermicular graphite structures, in line with observations on flake graphite structures. Nevertheless, despite the lower notch sensitivity of the incompletely spheroidized material compared to that of the fully spheroidized material, the latter still has a significantly higher fatigue limit. (4 refs.)

120419 The nature of quasicleavage fracture in tempered 5.5Ni steel after hydrogen charging. Y.H.Kim, J.W.Morris,Jr. (Univ. of California, Berkeley, CA, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1883-8 (Sept. 1983).
Quenched and tempered 5.5Ni steel was embrittled by hydrogen charging and broken in air at room temperature. The primary fracture mode was transgranular quasicleavage. The quasicleavage facets were studied by scanning electron fractography and by transmission electron microscopy of profile fractographic specimens. The latter were prepared by plating the fracture surface with nickel and thinning so that the fracture surface was contained within the region of the specimen that was transparent to the electron beam. The fracture surface generally followed martensite lath boundaries. In addition, interlath microcracks were frequently found in the material immediately beneath the fracture surface. These results suggest that transgranular hydrogen embrittlement in this steel is primarily an interlath cracking phenomenon. Since the lath boundary planes tend to lie in {110}, the results also explain the prevalence of {110} quasicleavage in the embrittled specimens, which contrasts with the {100} cleavage found in uncharged specimens broken below the ductile-to-brittle transition temperature. (15 refs.)

120420 Fracture toughness and fatigue behavior of Matrix II and M-2 high speed steels. Bingzhe Lou (Shaanxi Mech. Engng. Inst., Xian, China), B.L.Averbach.
Metall. Trans. A (USA), vol.14A, no.9, p.1889-98 (Sept. 1983).
The effects of heat treatment and of the presence of primary carbides on the fracture toughness, K_{Ic}, and the fatigue crack growth rates, da/dN, have been studied in M-2 and Matrix II high speed steels. The Matrix II steel, which is the matrix of M-42 high speed steel, contained many fewer primary carbides than M-2, but both steels were heat treated to produce similar hardness values at the secondary hardening peaks. The variation of yield stress with tempering temperature in both steels was similar, but the fracture toughness was slightly higher for M-2 than for Matrix II at the secondary hardening peaks. Fatigue crack growth rates as a function of alternating stress intensity, ΔK, showed typical sigmoidal behavior and followed the power law in the middle-growth rate region. The crack growth rates in the near threshold region were sensitive to the yield strength and the grain sizes of the steels, but insensitive to the sizes and distribution of undissolved carbides. The crack growth rates in the power law regime were shifted to lower values for the steels with higher fracture toughness. SEM observations of the fracture and fatigue crack surfaces suggest that fracture initiates by cleavage in the vicinity of a carbide, but propagates by more ductile modes through the matrix and around the carbides. (13 refs.)

120421 The effects of heat treatment on fracture toughness and fatigue crack growth rates in 440C and BG42 steels. Bingzhe Lou (Shaanxi Mech. Engng. Inst., Xian, China), B.L.Averbach.
Metall. Trans. A (USA), vol.14A, no.9, p.1899-906 (Sept. 1983).
The fatigue crack growth rates, da/dN, and the fracture toughness, K_{Ic} have been measured in two high-carbon martensitic stainless steels, 440C and BG42. Variations in the retained austenite contents were achieved by using combinations of of austenitizing temperatures, refrigeration cycles, and tempering temperatures. In nonrefrigerated 440C tempered at 150°C, about 10 vol pct retained austenite was transformed to martensite at the fracture surfaces during K_{Ic} testing, and this strain-induced transformation contributed significantly to the fracture toughness. The strain-induced transformation was progressively less as the tempering temperature was raised to 450°C, and at the secondary hardening peak, 500°C, strain-induced transformation was not observed. In nonrefrigerated 440C austenitized at 1065°C, K_{Ic} had a peak value of 30 $MPa.m^{1/2}$ on tempering at 150°C and a minimum of 18 $MPa.m^{1/2}$ on tempering at 500°C. Refrigerated 440C retained about 5 pct austenite, and did not exhibit strain-induced transformation at the fracture surfaces for any tempering temperature. The K_{Ic} values for corresponding tempering temperatures up to the secondary peak in refrigerated steels were consistently lower than in nonrefrigerated steels. All of the BG42 specimens were refrigerated and double or quadrupole tempered in the secondary hardening region; the K_{Ic} values were 16 to 18 $MPa.m^{1/2}$ at the secondary peak. (26 refs.)

120422 Fractographic observations of cleavage initiation in the ductile-brittle transition region of a reactor-pressure-vessel steel. A.R.Rosenfield, D.K.Shetty, A.J.Skidmore (Battelle-Columbus Labs., Columbus, OH, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1934-7 (Sept. 1983).
Reports the results of a fractographic study conducted on a group of 1T fracture toughness specimens of a heavy-section A508 steel denoted TSE6 tested in the ductile-brittle transition region (22 and 82°C). The fatigue-precracked specimens were loaded at rapid rate (760 or 550 mm per second) to promote cleavage-crack growth and lower-bound toughness behavior. The objective of the fractographic examinations was to understand the observed statistical variations in cleavage initiation by (a) locating the origins of unstable cleavage fracture in the vicinity of the fatigue-precrack or ductile-rupture crack fronts, (b) identifying microstructural features associated with the triggering of cleavage, and (c) documenting characteristic fracture surface dimensions such as the extent of stable-crack growth prior to unstable cleavage (Δa) and the distance of the cleavage origin from the ductile-rupture front, x (or fatigue-crack front when $\Delta a=0$). (16 refs.)

120423 A study on statistical fatigue properties of metallic materials with particular attention to the relation between fatigue life and fatigue strength distributions. T.Sakai, A.Sakaida, K.Fujitani, T.Tanaka (Dept. of Mech. Engng., Ritsumeikan Univ., Kyoto, Japan).
Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.41, p.79-91 (1982). In Japanese.
The main purpose of this study is to clarify the relation between fatigue life and fatigue strength distributions of structural metallic materials. The major results obtained are summarized as follows: (1) If the fatigue life distribution and its stress dependency are given, the fatigue strength distribution at any fixed life can be analytically derived. In particular, if a log-normal distribution with a constant standard deviation is assumed as the life distribution and if a linear central S-N curve is provided, the fatigue strength distribution is reduced to a normal distribution. (2) The fatigue life distribution at any stress level can be also theoretically derived from the fatigue strength distribution and the stress dependency of its parameters. (3) Examining the validity of this concept by using the experimental fatigue data of low carbon steel and aluminum alloys, it is shown that the analytical representation in this paper is applicable to actual engineering metallic materials. (20 refs.)

120424 Interlayer-strength criterion for carbon-fiber-reinforced plastics under cyclic loadings. Yu.N.Rabotnov, V.P.Kogaev, A.N.Polilov, V.B.Strekalov (A.A. Blagonravov Inst. of Machine Sci., Acad. of Sci., Moscow, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.652-6 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.983-6 (Nov.-Dec. 1982). [received: Sept. 1983]
A strength criterion is developed for composites subject to static loads, which makes it possible to explain the relationship between interlayer shear strength and the ratio of the length l of a beam of its thickness h. Fatigue testing of specimens in interlayer shear was carried out by the method of the three-point bending of a short beam. (4 refs.)

120425 Effect of low-cycle loading on the mechanical characteristics and structure of unidirectional organoplastic. M.Ya.Mikel'son, A.Kh.Kurzemnieks (Inst. of Polymer Mech., Acad. of Sci., Riga, Latvian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.669-73 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1002-7 (Nov.-Dec. 1982). [received: Sept. 1983]
Low-cycle loading was found to cause significant variations in the mechanical properties of unidirectional organoplastic—a variation in the character of the σ-ϵ relationship and corresponding variations in the elastic modulus, the area of the hysteresis loop, and the accumulation of residual strain. The magnitude of the residual strain during fatigue loading increased with increasing cyclic stress and may reach 1.5% prior to failure. The area of the hysteresis loop decreased under cyclic loading. The area of the loop increased prior to failure. The total energy dissipation increased with decreasing cyclic stress. Preliminary cyclic loading on a base $N=10^3$ cycles did not have a pronounced effect on the strength of unidirectional organoplastic. (5 refs.)

120426 Effect of dimensional factors of a disperse filler on the strength of epoxy composites. V.I.Solomatov, A.N.Bobryshev, A.P.Proshin (Penza Civil Engng. Inst., USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.674-9 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1008-13 (Nov.-Dec. 1982). [received: Sept. 1983]
Strength tests were conducted on EC specimens fabricated by casting ED-20 epoxy resin filled with ground quartz sand, the average particle size of which was 2.38×10^{-2} mm, under normal pressure. The specimens were held at room temperature for 24 h, and then subjected to heat treatment at 80°C for 8 h. The filler content I (the percent ratio of the mass of the filler to the mass of the resin) was varied within the range from 0 to 600%. The specimens were tested in compression, bending, and for impact cyclic strength. Specimens with dimensions of $(1\times1\times1)\times10^{-2}$ m and $(1\times1\times5)\times10^{-2}$ m were used in the compression and bending tests, respectively. The strain rate in these tests was held constant and was 4×10^{-3} m/min. In the tests for impact cyclic strength, 'mushroom'-type specimens were used. (21 refs.)

120427 Quasi-brittle fracture of specimens with a cutout in the form of a line. I.I.Bugakov.
Mech. Solids (USA), vol.17, no.6, p.163-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.177-80 (1982). [received: Oct. 1983]
An attempt is made to fill the gap in the existing studies of fracture of specimens with sharp concentrators. The object of study was provided by plane specimens of glass-like polymer with a central straight-through cutout in the form of a lune. In terms of its shape, this type of cutout is intermediate between a circular hole and a crack. Experiments yielded data on quasi-brittle fracture of specimens with a lune, as well as with a circular cutout and with an initial crack. The specimen material was provided by an epoxy polymer based on ED-20 resin (elastic modulus 3 GPa, Poisson's ratio 0.35). (10 refs.)

120428 Fatigue strength of Elit 25, a glass-fibre reinforced poly(ethylene terephthalate). M.Nowak (Inst. Materialoznawstwa i Mechaniki Technicznej, Politech. Wroclawska, Wroclaw, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.113-17 (April 1983). In Polish. [received: Oct. 1983]
The results of fatigue strength investigations of unfilled PET and PET containing 25 per cent of short cut glass fibres under the following conditions of test: 10^7 cycles, temperature—298K, frequency—15 Hz have been presented. It has been found that the fatigue limit of PET and of Elit 25 changes during the exposure time according to normal distribution. The effect of water sorption, temperature, and thermal treatment on the fatigue limit of PET and Elit 25 has been studied. It has been stated that the modified types of Elit, namely Elit 25u and Elit 30EX, exhibit more advantageous fatigue properties than Elit 25. (18 refs.)

120429 Fatigue strength of Itamid 25 (glass-fibre reinforced polyamide-6). M.Nowak (Inst. Materialoznawstwa i Mech. Tech., Politech. Wroclawska, Wroclawska, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.2, p.56-9 (Feb. 1983). In Polish. [received: Oct. 1983]
Presents the results of the time interval and its decrease during the tests carried out under long-term fatigue load conditions (10^7 cycles) as well as under natural ageing conditions either with water sorption ($\tau_w=2160$ h) or with a long time of exposure ($\tau\geq84$ months). Itamid 25 material presents the following advantages: positive effect of thermal treatment and a relatively high value of the fatigue limit, Z_{go}, in the investigated time interval and its lower decrease during the full ageing cycle than in the case of reference samples prepared from pure resin matrix. Its drawbacks are, however, a higher rate of ageing and the capillary effect. Moreover, the home-made polyamide-6 (ZA Tarnow) is a material suitable for use in the manufacture of reinforced compounds, in spite of its high water sensitivity. (30 refs.)

120430 Development of a crack growth algorithm for time-dependent analysis of steam turbine rotors. A.M.Curzon, C.H.Wells.
Report EPRI-NP-3187, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 46 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present a data base of published and yet unpublished data on the rate of high-temperature creep crack growth in 1CrMoV steel. Development of a calculational procedure for use in predicting creep crack growth that is suitable for incorporation into SAFER or similar turbine rotor life prediction codes is described. Details are provided on the parameter C*, a time-dependent parameter that is a function of stress and strain rates near the crack tip, the temperature and loading cycling effects on crack growth rates, and the prior bulk creep rupture damage.

120431 Deformation and fracture of polydiacetylene single crystal fibres. D.N.Batchelder (Dept. of Materials, Queen Mary Coll., London, England), C.Galiotis, R.T.Read, R.J.Young.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.21-6
The structure of polydiacetylene single crystal fibres has been examined by high resolution electron microscopy. The polymer molecules are aligned parallel to the fibre axis and the crystals have a high degree of perfection. The Young's modulus and fracture strength are high and the polymer chains are found to have a stiffness similar to that of polyethylene molecules. A theory has been developed to explain the dependence of the fracture strength of the fibres upon fibre diameter as being due to surface steps. The theoretical strength of the crystals has been determined and it corresponds to fracture strains in excess of 5%. (10 refs.)

120432 Generalized fracture mechanics of ductile fracture in polycarbonate. E.H.Andrews, S.R.Barnes.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.8/1-5
Ductile crack propagation was induced in polycarbonate sheet marked with a fine printed grid. The plastic strain field thus determined was used to evaluate the generalized fracture mechanics 'loss function' and this allows the surface energy for fracture to be extracted. Although smaller than the total fracture energy, the 'surface energy' obtained for polycarbonate is very large, in contrast to results from elastomeric and soft polymers. This result is explained by the fact that the 'surface energy' in polycarbonate contains the energy for craze formation, whereas in soft polymers fracture is not preceded by crazing. (7 refs.)

120433 Molecular aspects of crack formation and healing in glassy polymers. H.H.Kausch, K.Jud.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.9/1-6
The possible role of chain entanglements in stress transfer is discussed. By the new method of crack healing chain diffusion coefficients down to 1×10^{-22} m^2/s have been determined. On the basis of these results it can be estimated that the full short time stresses are transferred in PMMA and SAN once a level of 9% of the equilibrium entanglement concentration has been attained in the interfacial region. The latter estimate is based on the so far unproven proportionality between the number of new entanglements and the diffusion distance. (14 refs.)

120434 Unified approach to crack growth in glassy polymers under any load conditions. V.I.Aleshin, E.L.Aero, M.F.Lebedeva, M.I.Bessonov.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.10/1-6
The dependence of the specific fracture work on the crack growth rate has been found for PMMA glasses by double torsion under steady-state conditions. It has been used for the analysis of the crack growth kinetics under uniaxial tension and under tensile forces applied to the crack sides. The results of calculations are in agreement with experiment. Steady-state conditions have been shown to be the most sure base of further theoretical and experimental study of crack growth. (13 refs.)

120435 Ductile fracture of polypropylene. K.Prabhat, J.A.Donovan.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.13/1-6
Polypropylene (PP) can fail by tearing instability (TIS) when the elastic contraction is greater than the plastic extension due to crack growth. TIS depends on the material properties as well as the dimensions and compliance of the system. Fracture properties of 13 mm thick PP sheet were determined at deformation rates of 10^{-4} to 10^{-2} m/min. For these rates T_m, the tearing modulus, decreased from 20 to 2. Crack growth in a compact tension specimen was always stable, while stability of crack growth in double edge notch and bend specimens depended on specimen geometry. TIS theory developed by Paris and co-workers (see ASTM STP vol.668, p.5, 1979) describes the ductile fracture behaviour of PP. (10 refs.)

120436 On the strength of vulcanized rubbers. G.J.Lake, O.H.Yeoh (Malaysian Rubber Producers' Res. Assoc., Hertford, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.14/1-7
The influence of crack tip radius on crack propagation in vulcanized rubbers has been studied. For very sharp cracks, tearing is found to occur on a small scale at very low energies; the 'small-scale' tearing energies show relatively little variation for rubbers that differ widely in tear strength as normally measured. Thus the latter property appears to be strongly influenced by variations in the ability of rubbers to promote tip roughening. The small-scale tear behaviour is of relevance to other fracture phenomena including cutting by sharp objects and tensile failure. (19 refs.)

120437 The application of infrared microscopy to the study of polymer fatigue. M.T.Hahn, R.W.Hertzberg, R.W.Lang, J.A.Manson, J.C.Michel, A.Ramirez, C.M.Rimnac, S.M.Webler.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.19/1-6
A model describing the frequency sensitivity of fatigue crack propagation (FCP) of polymers in terms of localized versus generalized specimen heating is examined. The magnitude of heating at the crack tip and across the unbroken ligament of the specimen is measured with an infrared microscope. The results confirm the earlier hypothesis regarding the observed frequency dependence of FCP behavior. (10 refs.)

120438 Direct measurements of craze zones at crack tips in glassy thermoplastics during fatigue crack growth. W.Doll, M.G.Schinker, L.Konczol (Fraunhofer-Inst. fur Werkstoffmech., Freiburg, Germany).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.20/1-6
For a transparent thermoplastic material loaded by cyclic fatigue the behaviour of the craze zone at the moving crack tip has been investigated by applying an special experimental set-up. It allows the simultaneous measurement of the crack speed, the instantaneous load on the specimen and the microscopic interference fringe pattern of the craze zone at any moment of the loading cycle. By this, maximum width and length of the craze zone have been measured as functions of crack speed and fatigue crack growth rate in a wide frequency range on PMMA of high molecular weight. The experimental results show that in the investigated parameter range maximum craze width 2 v and hence crack opening displacement COD increase by nearly an order of magnitude. (13 refs.)

120439 Fatigue crack propagation in amorphous polymers. P.Bouska (Res. Inst., CKD PRAHA, Prague Czechoslovakia), V.Zilvar.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.21/1-6
The dependence between the material Paris law parameter M and the fracture toughness, K_{Ic}, of some amorphous polymers at temperature around 293K was found. Fatigue tests have been further conducted on an epoxy resin over the temperature range 343 to 403K. These data have been analysed using an empirical crack growth rate approach. Associated changes in K_{Ic} with temperature have also been noted. (10 refs.)

120440 Fatigue of rubber in compression. A.Stevenson (Malaysian Rubber Producers' Res. Assoc., Hertford, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.22/1-6
Repeated deformation of rubber cylinders in compression causes cracks to initiate at tensile stress concentrations (i.e. bond edges). The cracks grow to remove the rubber which at maximum deformation bulges outside the original profile of the cylinder. The results are analysed in terms of fracture mechanics. The tearing energy, T is substantially independent of crack length. The relation between crack growth rate dc/dN and T appears to be a material property, independent of testpiece geometry. (9 refs.)

120441 Micromechanical failure predictions for polymer-matrix composites. D.F.Adams (Univ. of Wyoming, Laramie, WY, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.23/1-6
A micromechanics analysis and associated finite element computer program have been developed, and used here to predict the inelastic stress state and crack propagation in a model composite. The model includes a single broken fiber surrounded by a sheath of matrix, this composite being subjected to an axial tensile stress. Both glass/epoxy and graphite/epoxy composites, for various fiber volume ratios are modeled. Curing residual stresses, and hygrothermal effects induced at elevated temperatures in humid environments, are included. Results demonstrate the ability to propagate a stable crack, and will be useful in correlating with experiments to study the role of the matrix in the failure process. (8 refs.)

120442 The use of fracture maps in a failure analysis of fibre composite materials. J.K.Wells, P.W.R.Beaumont (Dept. of Engng., Univ. of Cambridge, Cambridge, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.24/1-6
Models for the fracture of fibre-reinforced composites are presented. These enable two characteristic parameters (fibre pull-out length and fibre debond length) to be calculated and then used in models of energy absorption to predict composite toughness. The results are presented in a 'map' form which demonstrates the variation of toughness with the simultaneous change of two material parameters. A case study is presented which investigates the effect of moisture on the failure of an E-glass/epoxy composite. (6 refs.)

120443 Microstructure and fracture mechanical properties of short fiber reinforced thermoplastic PET. K.Friedrich (Inst. fur Werkstoffe, Ruhr-Univ., Bochum, Germany).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.26/1-6
Presents results of fracture mechanics tests and corresponding observations of the fracture behavior of short fiber reinforced, thermoplastic polyethylene terephthalate depending on microstructural parameters. The fracture toughness is higher for cracks perpendicular to the main fiber orientation and increases with the weight fraction of fibers. Fatigue cracks indicate the same tendency, i.e. their growth rate is low for cracks transverse to the fibers in samples with high fiber fraction. Additional influences on fracture behavior due to differences in matrix toughness and strength of the fiber/matrix interface are discussed. (4 refs.)

120444 Deformation and fracture of thermoplastics containing spherical particles: a comparison between rigid spheres and rubber particles. C.B.Bucknall (Cranfield Inst. of Technol., Bedford, England), D.P.Jones.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.27/1-6
Stress concentrations due to rubber particles and glass beads have been measured in a series of polypropylenes, by means of Eyring plots of yield stress against log (strain rate). The stress concentration factor depends principally upon the volume fraction of added particles. Other factors, including homogeneity of dispersion, particle size, and particle-matrix adhesion, have little effect upon yield stress, but do influence G_{IC}, as measured in three point bending at −70°C. (7 refs.)

120445 Crack propagation in a rubber-toughened epoxy. A.J.Kinloch, S.J.Shaw, D.L.Hunston (Min. of Defence (PE),,WalthamAbbey. PERME,England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.29/1-6
A quantitative model is developed which describes the crack propagation behaviour of both an unmodified and a rubber-toughened epoxy over a wide range of test rates and temperatures. This model leads to a fracture criterion based upon attaining a critical stress acting over a critical distance at the crack tip. The more complex behaviour of the rubber-toughened epoxy when it is constrained as an adhesive layer, bonding steel substrates, is then described and differences between the bulk and adhesive joint specimens highlighted and discussed. (15 refs.)

120446 The impact fracture mechanics of semi-ductile polymers. F.X.de Charentenay, J.J.Robin, T.Vu-Khanh (Dept. de Genie Mecanique, (ERA 910),,Compiegne. Univ. de Technol. de Compiegne,France).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.33/1-6
Fracture mechanics has been applied to impact test of semi-ductile polymers. A new interpretation of the Charpy test is proposed for the fracture energy evaluation in the case of ductile-brittle fracture mode. Results of an instrumented impact test are also presented and discussed. (7 refs.)

120447 Crack growth behaviour in polyester moulding compounds. D.W.Lamb, F.W.Noble, A.G.Gibson (Dept. of Metall. & Materials Sci., Univ. of Liverpool, Liverpool, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.39/1-5
Crack propagation measurements on DMC containing 1.5, 6 and 12 mm chopped glass strands confirm that failure is preceded by damage zone formation ahead of the crack tip. Results suggest that at the two longer fibre lengths failure is best determined by a gross stress criterion, rather than stress intensity factor. (4 refs.)

81.40P Friction, lubrication, and wear

(see also 62.20P Tribology)

120448 Effect of length and diameter of wire on the interfacial shear stresses in wire embedded concrete specimens due to pull-out of wire. I.A.Pathan (Mehran Univ. of Engng. & Technol., Jamshoro, Pakistan).
Mehran Univ. Res. J. Eng. & Technol. (Pakistan), vol.2, no.1, p.1-6 (Jan. 1983). [received: Sept. 1983]
The pull-out loads were determined for the single wire embedded concrete specimens. The average shear strength, shear strength of the interface and frictional shear stresses were calculated for various diameters and lengths of embedded wire using Greszczuk's theory of interfacial stresses. Results indicate that frictional shear stresses at the interface remain constant with the increase in length of the embedded wire. The shear strength of the interface and frictional shear stresses are found to increase with an increasing wire diameter. (9 refs.)

120449 High-temperature friction of alloys of the TiN_x-TiB_2 system. Yu.G.Tkachenko, S.S.Ordan'yan, D.Z.Yurchenko, V.K.Yulyugin, D.V.Chupov (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.137-41 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR),* vol.22, no.2, p.70-6 (Feb. 1983). [received: Sept. 1983]
It was established that the highest transverse rupture strength and wear resistance combined with the lowest coefficient of friction were shown by alloys of eutectic composition. In alloys of the $TiN_{0.9}$-TiB_2 system higher ductility during friction was exhibited by the boride phase, whose substructure experienced greater changes compared with the nitride phase. The greatest deformation during friction characterized the phases in the $TiN_{0.73}$-TiB_2 alloy. The strengthening and strength loss processes at temperatures of 20-400°C were determined by the strength loss processes occurring in the boride phase, and those above 400°C, by the strengthening and strength loss processes taking place in the nitride phase. (4 refs.)

120450 Friction and wear in ultra high vacuum a contribution to tribology. P.Marmy (Eidgenossisches Inst. fur Reaktorforschung, Wurenlingen, Germany).
Vak.-Tech. (Germany), vol.32, no.6, p.163-7 (Sept. 1983). In German.
The unlubricated movement of rubbing parts in an ultra high vacuum is the known source of seizing. This phenomenon has been described by a theory which predicts the onset of failure. The new concept of the 'abrasion energy'

of the oxide layer is introduced. This abrasion energy could be determined for the pair ETG 100—hard metal. The usefulness of the method is demonstrated from measurements. (2 refs.)

120451 The role of wear debris in the study of wear. A.D.Sarkar (Dept. of Mech. Engng., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Wear (Switzerland), vol.90, no.1, p.39-47 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
The danger of using the steady state wear rates of metals to compare materials is indicated; the total wear must also be considered. Particle size analysis shows that, in sliding wear, the smallest particles are the most numerous. Surface topographies of steel and aluminium alloys as produced in laboratory machines were compared with the corresponding wear debris. It is suggested that a representation atlas of wear debris would be a valuable aid to the diagnosis of the state of industrial friction couples without dismantling them. The beneficial role of ferrography in this regard is restated. (22 refs.)

120452 Wear studies through particle size distribution. I Application of the Weibull distribution to ferrography. B.J.Roylance (Dept. of Mech. Engng., Univ. Coll. of Swansea, Swansea, Wales), G.Pocock.
Wear (Switzerland), vol.90, no.1, p.113-36 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
The use of wear particle size distributions as a means for distinguishing different modes of wear and determining its transitory behaviour is evaluated in terms of the quantitative analysis of Ferrograms by Quantimet. The Weibull distribution function is proposed and the results obtained from different wear situations are presented; they confirm that changes in the mean and the variance of the distribution provide clear indications of the type and extent of the wear as it progresses. (12 refs.)

120453 The contribution of particle analysis to the study of wear of metals. F.T.Barwell (Univ. Coll. of Swansea, Swansea, Wales).
Wear (Switzerland), vol.90, no.1, p.167-81 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
The possibilities of particle tribology in general and ferrography in particular are discussed as means for identifying and quantifying the modes of wear as determined by environmental and operational factors. Whilst adhesion between interacting bodies occurs frequently, this cannot itself cause wear particles to be formed and the importance of fatigue in the wear process is stressed with reference to Japanese work. The delamination theory of wear is summarized and adduced to explain the formation of thin plate-like particles which are usually encountered under low wear conditions. A series of experiments wherein discs in edgewise contact were subjected to various loads and speeds produced a predominant number of rubbing wear platelets together with occasional spheres and cutting-type particles. 81.40R Electrical and magnetic properties (related to treatment conditions)

(see also 72.80 Conductivity of specific semiconductors and insulators, 74.70 Superconducting materials, 75.50 Studies of specific magnetic materials)

120454 Changes in local order and residual electrical resistance during heating of Ag-Al (15 wt.%). V.S.Zubchenko, P.V.Petrenko, O.O.Tatarov, O.V.Terukov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.82-4 (1983). In Ukrainian.
The Ag-15 at.% Al alloy is characterized by different types of short-range order within different temperature ranges. When the alloy is heated changes occur in the short-range order degree and type, which explains the observed non-monotonous variations of diffuse scattering intensity, ordering parameters and residual resistance of the Ag-15 % Al alloy. (8 refs.)

120455 On the high-energy product Fe-Pt permanent magnet alloys. K.Watanabe, H.Masumoto (Res. Inst. of Electric & Magnetic Alloys, Sendai, Japan).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.9, p.627-32 (Sept. 1983).
The permanent magnetic properties of Fe-34-67.5 at.%Pt alloy have been investigated. It is found that the magnetic properties of an Fe-38.5 at.%Pt alloy quenched from the disorder phase γ (*fcc*) region and subsequently aged at 773K (500°C) for 360 ks (100 h) in the ordered phase γ_1 (*fct*, $L1_0$-type) region, are $B_r=1.08$ T (10.8 kG), $H_c=340$ kA.m^{-1} (4.3 kOe) and $(BH)_{max}=159$ kJ.m^{-3} (20 MG.Oe). X-ray analysis and microstructural observations indicate that the magnetic hardening is due to the ordering stage from the γ phase to the γ_1 phase having a high crystal magnetic anisotropy. 120456 Epoxy materials with good optical properties for applications in electron optics. T.Spychaj (Inst. Technol. Chem., Politech. Szczecinska, Szczecin, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.105-8 (April 1983). In Polish. [received: Oct. 1983]
Requirements to be met by epoxy materials used in sealing elements in electron optics have been discussed. Methods for preparing colourless and transparent epoxy resins have been presented. The patent literature concerning the epoxy compositions used in electron optics has been briefly reviewed. Some commercial epoxy materials for applications in electron optics have been characterized. (28 refs.)

120457 Micro-scaled spectral-resolved cathodoluminescence of grains in barium titanate ceramics. G.Koschek, E.Kubalek (Fachgebiet Werkstoffe der Elektrotech., Univ. Duisburg, Duisburg, Germany).
Phys. Status Solidi a (Germany), vol.79, no.1, p.131-9 (Sept. 1983).
The grain cathodoluminescence (CL) properties of barium titanate ceramics, sintered at different oxygen partial pressures are systematically investigated. The spectra are found to be composed of different bands, the intensities of which depends strongly on the specimen temperature and on the oxygen partial pressure of the ambient atmosphere during the sintering process. By fitting the obtained spectra with superposed-Gaussian curves it is shown that the involved recombination processes can be satisfactorily explained within the configurational coordinate model. Furthermore it is possible to trace back the observed electronic transitions to vacancy luminescence, corroborating existing theories on band schemes, and on dependences of vacancy concentrations on oxygen partial pressure during the sintering. In this way the observed bands may be assigned to transitions in the energy gap of $BaTiO_3$. (13 refs.)

120458 The water ageing of unsaturated polyester-based composites: influence of resin chemical structure. A.Apicella, C.Migliaresi, L.Nicolais (Polymer Engng. Lab., Univ. of Naples, Naples, Italy), L.Iaccarino, S.Roccotelli.
Composites (GB), vol.14, no.4, p.387-92 (Oct. 1983).
Mechanical and calorimetric analyses have been carried out on four glass fibre laminated polyester resins (isophthalic, vinyl ester and bisphenol A and B) aged in liquid water at 20°C and 90°C, and the water uptake kinetics are described. Weight losses, disc shaped crack formation, embrittlement, fibre debonding and delamination are the principal morphological changes observed. The autocatalytic hydrolysis of the ester groups may be responsible for the chemical degradation. The hydrolytic stability of the systems investigated was improved by the inclusion of fewer ester groups in the repeating units of the initial polyester prepolymer. (10 refs.)

120459 Ion beam etching of InP. II. Reactive etching with halogen-based source gases. Y.Yuba, K.Gamo, X.G.He, Y.S.Zhang, S.Namba (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1211-10 (July 1983).
For pt.I see ibid., vol.22, no.7, p.1206 (1983). The reactive-ion beam etching (R-IBE) characteristics of InP with Cl_2, CCl_2F_2 and CHF_3 have been studied. Some R-IBE characteristics of GaAs have also been studied. The etching rate for each gas has been determined as a function of ion energy, current density and angle of incidence. The highest etching rate, around 2000 Å/min, is obtained in Cl_2-IBE, while the two other source gases yield an etching rate lower than that of Ar-IBE. In the case of CCl_2F_2-IBE, the addition of Ar is found to enhance the etching considerably. These IBE techniques are used to fabricate a grating structure with a period around 2500 A. (10 refs.)

120460 Correlations of the dry crazing resistance of glassy polymers with other physical properties. R.P.Kambour (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
Polym. Commun. (GB), vol.24, no.10, p.292-6 (Oct. 1983).
The dry crazing resistance of a large number of glassy thermoplastics has been found to correlate equally well with either of two compound functions that contain the cohesive energy density and glass temperature. One function contains, in addition, the yield stress for shear failure the other the elastic modulus. Implications for an ultimate correlation of toughness properties with molecular structure are discussed. (34 refs.)

120461 Study of cleaved, oxidized, and heat-treated CdTe surfaces. J.-P.Haring, J.G.Werther, R.H.Bube (Dept. of Materials Sci., Stanford Univ., Stanford, CA, USA), L.Gulbrandsen, W.Jansen, P.Luscher.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1469-72 (1983).
The chemical compounds present on the surface of CdTe have been investigated after different surface preparations and correlated with the properties of junctions formed by Cr on the CdTe. X-ray photoelectron spectroscopy (XPS) analysis indicates that four different surface compositions result from five different treatments. Cleaving leaves a stoichiometric surface whereas oxidation in air leads to the formation of TeO_2. Bromine-in-methanol etch leaves a Te-enriched surface and chromate etch leaves a surface containing both TeO_2 and excess Te. Hydrogen heat treatment of an etched CdTe surface restores a stoichiometric cleavedlike surface from that disrupted by the etching process. Effects on the properties of subsequently formed junctions are evidenced by a decrease in the diode saturation current from 2×10^{-5} for a bromine-etched surface to 2×10^{-8} A/cm^2 for a cleaved surface. (12 refs.)

120462 Surface topography of oxides on InP thermally grown at high temperatures. J.J.McLaren,III, A.Nelson, K.Geib, R.Gann, C.W.Wilmsen (Dept. of Electrical Engng., Colorado State Univ., Fort Collins, CO, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1486-90 (1983).
The surface topography of the thermal oxides on InP are shown to blister for growth temperatures somewhat above 600°C. It appears that the oxide softens sufficiently to allow the trapped phosphorus at the interface to expand, thus causing the surface bubbles to form. The size of the bubbles vary considerably across a wafer and they tend to increase in size with temperature. At 780°C one bubble had a radius of ≈100 μ. At $T\lesssim650$°C the elemental phosphorus at the interface is the source of the P and the underlying substrate remains smooth. Above this temperature the InP substrate provides the P as shown by the pits in the substrate. There appears to be a relationship between the surface roughening and a change in oxide layer composition. (10 refs.)

120463 A simple, inexpensive device for ion-bombardment cleaning of samples in ultrahigh vacuum. V.M.Bermudez, R.E.Thomas (Naval Res. Lab., Washington, DC, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1557-8 (1983).
An apparatus is described which can be constructed easily from readily-available components. A tungsten filament is connected across two pins of a multipin UHV instrumentation feedthrough. To a third pin is connected an anode consisting of a section of metal foil (in this case, nickel, was used for convenience) spot welded to a stiff wire. The foil is bent into the shape of a cylindrical section, with the radius of curvature roughly equal to the intended sample-to-anode distance (~4 cm). If desired, the feed-through can be mounted on a 'port aligner' flange to permit positioning control. A typical cleaning operation consists of first backfilling the chamber to about 5×10^{-5} Torr of argon and energizing the filament (~2.2 A, 6 V a.c.). With the anode biased at +500V d.c., an emission current of about 18 mA is obtained, and an average Ar^+-ion flux of about 20 $\mu A/cm^2$ is measured at the sample. (no refs.)

120464 Initial stages of oxide formation on HgCdTe exposed to activated oxygen. J.A.Silberman, D.Laser, I.Lindau, W.E.Spicer (Stanford Electronics Lab., Stanford Univ., Stanford, CA, USA), J.A.Wilson.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1706-11 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
The changes in chemistry and electronic structure of the (110) cleavage surface of $Hg_{0.65}Cd_{0.35}Te$ and properties of the film produced are determined by monitoring with photoemission spectroscopy the growth of thin (10 Å) oxide layers on initially clean surfaces. Oxygen uptake, normally quite slow, is stimulated in this case by operating an ionization gauge in line of sight of the sample during the exposures so as to provide a stream of excited oxygen striking the surface. A complex Te oxide is formed which retains Cd but not Hg. The Cd content appears enhanced at the oxide surface. An explanation for the behavior observed is sought in terms of the species produced by the activating gauge and the chemistry of the alloy surface. (22 refs.)

120465 Passivation properties and interfacial chemistry of photochemically deposited SiO_2 on $Hg_{0.70}Cd_{0.30}Te$. B.K.Janousek, R.C.Carscallen, P.A.Bertrand (Chem. & Phys. Lab., Aerospace Corp., Los Angeles, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1723-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
SiO_2 deposited photochemically at a substrate temperature of 100°C has been evaluated as a surface passivant on $Hg_{1-x}Cd_xTe$ ($x=0.30$). It has been determined that the electrical properties of the (Hg,Cd)Te-SiO_2 interface are dependent on the pretreatment given the semiconductor surface prior to the insulator deposition. Formation of a thin native oxide on the (Hg,Cd)Te surface during the pretreatment appears to enhance the resultant (Hg,Cd)Te-SiO_2 interface properties. A significant spread in the (Hg,Cd)Te-SiO_2 interface properties is observed, likely owing to the nature of how this native oxide forms and interactions between the native oxide and the SiH_4 in the photochemical reactor. It is shown through neutron activation analysis that the Hg employed as a photochemical sensitizer is incorporated in the SiO_2 at a concentration of 1.8 ppm. (16 refs.)

120466 Passivation patterning technique. J.A.Van Vechten (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.923-4 (Aug. 1983).
Electron beam patterning of silicon oxide is carried out without lithographic steps by condensing a layer of oxygen molecules on a silicon wafer cooled to 55K or below and activating localized low temperature oxidation by means of an electronically positioned electron beam. (no refs.)

120467 Chemically-assisted fracture of thermoplastic PET reinforced with short E-glass fibre. C.Lhymn, J.M.Schultz (Center for Composite Materials, Univ. of Delaware, Newark, DE, USA).
J. Mater. Sci. (GB), vol.18, no.10, p.2923-38 (Oct. 1983).
The study of the stress-rupture lifetime of a PET/glass fibre system by means of fracture mechanics methods indicates the degradation of lifetime under an aggressive environment (10% HCl solution). The SEM-EDAX analysis reveals the depletion of calcium and aluminium elements from the fibre, and this is believed to be the cause of multiple fibre fractures. The fracture toughness is decreased because the role of fibre pull-out, which is the significant energy-consuming process, is negligible. A statistical analysis, from which the lifetime behaviour can be predicted, is carried out. (14 refs.)

120468 Effects of water on glass-filled methacrylate resins. K.J.Soderholm, P.D.Calvert (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).
J. Mater. Sci. (GB), vol.18, no.10, p.2957-62 (Oct. 1983).
Composite materials have been prepared with up to 50 vol% glass beads in two methacrylate resins: polymethyl methacrylate and 64% bisphenol A di (glycidyl methacrylate)-36% triethyleneglycoldimethacrylate. These composites were immersed in water at 60°C for up to six months and the changes in weight, elastic modulus and compressive strength were followed. In the polymethyl methacrylate composites the water uptake levels off after 5 days. The strength and modulus decrease over this period due to plasticization of the resin, but then increase again. The cross-linked methacrylate composites show the same decrease but no subsequent increase. Silane treatment of the glass beads reduces the water uptake by the resin and the decrease in modulus and strength. (7 refs.)

120469 The disentanglement time of the craze fibrils in polymethylmethacrylate. P.Trassaert, R.Schirrer (Ecole d'application des hauts polymeres, Strasbourg, France).
J. Mater. Sci. (GB), vol.18, no.10, p.3004-10 (Oct. 1983).
A breaking time has been defined for the fibrils in the craze at the tip of a steady-state moving crack. It has been shown that, for polymethylmethacrylate above the critical temperature of −20°C, the fibrils of the craze at the crack tip break due to a thermally activated process. The activation energy is equal to 23 Kcal mol^{-1}, which corresponds fairly closely to the activation energy of the β relaxation. Then, the breaking time is probably a disentanglement time rather than a breaking time of chains, and this may be used to explain the time-temperature behaviour of the macroscopic fracture toughness. (15 refs.)

120470 Methanol crazing of coarse shear bands in polystyrene. C.C.Chau, J.C.M.Li (Dept. of Mech. Engng., Univ. of Rochester, Rochester, NY, USA).
J. Mater. Sci. (GB), vol.18, no.10, p.3047-53 (Oct. 1983).
A specimen with coarse shear bands produced at stress concentrations by compression was immersed in methanol to observe craze formation. Thin crazes were initiated at shear bands and joined together while propagating to form thick crazes. Crazes were formed only on the tension side of shear bands with the craze planes perpendicular to the shear bands. When a craze propagated through a shear band, each displaced the other at intersections. Some secondary shear bands were transformed partly into crazes resulting in about a factor of ten increase in thickness. This transformation was achieved by a tensile deformation of fibrous sheets in the shear band with simultaneous production of fine fibres. (16 refs.)

120471 Corrosion of a borosilicate glass by orthophosphoric acid. H.V.Walters (Res. & Dev. Labs., Corning Glass Works, Corning, NY, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.572-4 (Aug. 1983).
A borosilicate glass was resistant to orthophosphoric acid at 95°C, whereas considerable corrosion occurred at higher temperatures. Tenacious crystal formation provided a barrier against further attack, but also produced stress resulting in spontaneous glass breakage. The acid-glass reaction is attributed to acid dehydration and consequent transformation to aggressive pyrophosphate. (7 refs.)

120472 Fluorine treatments of soda-lime silicate glass surfaces. R.K.Brow, W.C.LaCourse (New York State Coll. of Ceramics, Alfred Univ., Alfred, NY, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.123-4 (Aug. 1983).
A series of soda-lime silicate glasses was treated for varied times at different temperatures with 1,1-difluoroethane. Sodium and calcium fluorides formed on the surface of the treated glasses. Formation of NaF is proportional to the square root of time, implying a diffusion-controlled reaction. Structural relaxation decreases the rate of bloom formation at high temperatures. (8 refs.)

120473 Characterization of insoluble layers formed by NaOH attack on the surface of a ZrO_2-containing silicate glass. A.Makishima, M.Tsutsumi, T.Shimohira (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan), T.Nagata.
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.139-40 (Aug. 1983).
The durability of an alkali-resistant glass containing ZrO_2 in NaOH solution was studied by scanning electron microscopy. Insoluble Zr-rich reaction-product layers $\approx$1 to 3 μm thick were observed on the surface of glass which had been soaked for 25 d in 2N NaOH at 95°C. In some cases the layer seems to be an adherent film, but in others it adheres loosely to the glass surface and does not seem to effectively block alkali attack. (4 refs.)

120474 A mechanism for the effect of doping on the silicon native oxide thickness. A.Wolkenberg (Inst. of Electron Technol., Warsaw, Poland).
Phys. Status Solidi a (Germany), vol.79, no.1, p.313-22 (Sept. 1983).
A theoretical basis of surface oxidation kinetics of silicon of semiconductor purity are presented for normal ambient conditions and a relation is proposed between the native oxide layer thickness and the concentration of defects in the silicon crystallographic structure. This provides the possibility for interpreting the experimental data relation between the oxide layer thickness and the impurity concentration. The experimental data are verified and composed using various measuring techniques. The discussed hypothesis of doping-introduced defects is employed to explain the kinetics of anodic polarization on silicon electrodes. (32 refs.)

120475 Enhancement of resistance of polyethylene to seawater-promoted degradation by surface modification. R.W.Baird (Dept. of Chem. Engng., MIT, Cambridge, MA, USA).
Radiat. Phys. & Chem. (GB), vol.19, no.2, p.113-20 (1982). [received: Oct. 1983]
Low-density polyethylene was subjected to several surface-modification techniques, and the effectiveness of each method in retarding seawater-promoted degradation was evaluated. Surface treatments studied included radio-frequency glow-discharge exposure in air followed by diacid or triisocyanate co-polymerization and surface irradiation with 500 keV electrons of very low penetration. Plasma and co-polymerization treatments were monitored by ESCA and ART IR spectroscopy, from which tentative conclusions were possible concerning reaction rates and probable chemical nature of the modified surface regions. Electron irradiation was monitored by gel content and cellophane dosimetry. Samples of treated polyethylene were subjected to accelerated testing by cyclic flexure in seawater and wide-angle X-ray diffraction results showed that each treatment method studied caused retardation of degradation; however, the relative effectiveness of the various techniques varied greatly. (19 refs.)

120476 Surface grinding of high-corundum and zirconium ceramic. K.Oczos (Politechn. Rzeszowska, Rzeszawska, Poland).
Szklo & Ceram. (Poland), vol.34, no.4, p.121-6 (July-Aug. 1983). In Polish.
Presents the problems of the surface grinding process of high-corundum (with 98% Al_2O_3 content) and zirconium (10% ZrO_2−70% Al_2O_3) ceramic parts with diamond grinding wheels. Special attention has been paid to the quality assurance of the ground surfaces. The influence of various factors upon the value of normal grinding force component P_y and the surface roughness R_a has been determined. The mechanism of micromorphology in the forming of a ground surface is presented. (2 refs.)

120477 Oxidation of ultrafine boron carbide, vanadium carbide, and chromium carbide powders. Yu.L.Krut-skii, G.V.Galevskii, A.A.Kornilov (Inst. of Solid State Chem. & Ore Processing, Acad. of Sci., USSR).
Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.2, p.116-18 (Feb. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.2, p.47-50 (Feb. 1983). [received: Sept. 1983]
The investigation of the oxidation of the ultrafine carbide powders was based on high-temperature X-ray phase analysis with a DRON-0.5 diffractometer fitted with a GPVT-1500 attachment (conditions of X-ray photography: filtered copper radiation, U=35 kV, I=10 μA, ω=2 deg/min, scale of photography 1 cm=1°) and thermogravimetric analysis with a Paulik, and Eardey type derivatograph (conditions of recording of derivatograms: heating rate 10 deg C/min, sample weight 50 mg). The initial oxidation temperatures of ultrafine boron carbide, vanadium carbide, and chromium carbide powders were found to be much lower than those of powders of standard particle sizes. The increased reactivity of powders of the type investigated is attributable to their small particle size and imperfect crystal structure, which are characteristic of refractory compounds produced from the gaseous phase. (10 refs.)

120478 A fracture mechanics approach to surface embrittlement in ductile polymers. L.Rolland, K.Thomson, S.Mostovoy, L.Broutman.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.11-1/-7
A fracture mechanics approach is used to establish a criterion for surface embrittlement. One of the results of the analysis shows that the crack arrest toughness is a critical parameter which must be maximized to improve resistance to surface embrittlement. Experimental studies have been performed which support the theory. (no refs.)

120479 Crack initiation in thermooxidized surface skins of polyethylene. J.-F.Jansson, B.Terselius, U.W.Gedde.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.12/1-4
At low stresses the crack arresting transformation of the original structure into a fibrillar structure is substantially delayed. This allows the crack processes in the weak, noncrystalline regions to proceed far enough for causing long term brittle like fracture. It is suggested that the cracks formed in the brittle skin, which may be caused by thermooxidation during the production of polyethylene pipes, act as stress concentrators on the microscale accelerating the long term fracture processes. (3 refs.)

120480 Craze microstructure and micromechanics: the effects of entanglements. A.M.Donald (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England), E.J.Kramer.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.15/1-6
Quantitative transmission electron microscopy is used to study the micromechanics of crazes and deformation zones (DZs) in various glassy polymers. A strong correlation is found between a predicted maximum extension ratio λ_{max} of the craze or DZ, and the experimentally determined values λ_{craze} or λ_{DZ} for all these polymers. Polymers with a short chain contour length between entanglements l_e show an increased tendency for shear, and hence DZ formation, relative to crazing. Surface drawing is shown to be the general mechanism for craze thickening. Computed surface stress profiles for crazes grown from crack tips show stress concentrations at both the craze and crack tip; the average stress increases as l_e decreases. (3 refs.)

120481 Craze growth kinetics and the mechanical behavior of thin polystyrene films. A.Moreno, A.Moet, E.Baer (Dept. of Macromolecular Sci., Case Inst. of Technol., Cleveland, OH, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.16/1-6
Craze growth kinetics and tensile stress-strain behavior of thin films (2-4 μm) cast from polystyrene with monodisperse molecular weight were examined simultaneously. The high molecular weight polymer (2×10^6) exhibited unusual 'plasticity' most of which was attributed to crazing density and craze length evolution. Craze thickening is suggested to dominate higher levels of 'plastic' deformation. (8 refs.)

120482 Mechanical properties of the crazes in glassy polymers. R.Schirrer, C.Goett.
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.17/1-5
It has been shown that the single craze which appears at the crack tip in some amorphous polymers only exists above a certain critical temperature Tc. Four material properties (Young's modulus, craze stress, critical stress intensity factor and Young's modulus of the craze material) have been measured over a wide range of temperatures around Tc. The Young's modulus of the craze material shows an important drop above the critical temperature Tc, and therefore, it might be responsible for the critical temperature. (6 refs.)

120483 Small angle electron diffraction and imaging of crazes in polystyrene. H.R.Brown (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.18/1-5
Small angle electron scattering (SAES) has been used to examine the sturcture of crazes in polystyrene. A direct comparison of the SAES patterns from crazes in thin films with SAXS patterns from crazes in thick films has shown that the craze structures are similar in form but the fibrils are about 3 times larger in the thin films. A refraction effect in SAES patterns has enabled a direct measurement of the refractive index of polystyrene which was used in the calculation of craze images. (13 refs.)

120484 Toughness in PB/PS block copolymers and blends. A.S.Argon, F.S.Bates, R.E.Cohen, O.S.Gebizlioglu, C.E.Schwier (Dept. of Mech. Engng. & Chem. Engng., MIT, Cambridge, MA, USA).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.28/1-9
The mechanisms of craze matter conversion was studied in a series of anionically polymerized di-block copolymers of increasing molecular weight but constant molecular weight ratio to result in only a twisted rod morphology. A direct correspondence was found between the phase morphological wave length and the scale of the craze microstructure. The main source of improved toughness was, however, the increased entanglement density or the cross-link density in both the PS and PB phases, which could be controlled also by irradiation. In PS/K-Resins blends, having particle sizes ranging from 0.1-1.0 μm but with inner microstrucural wave lengths of only 15 nm, no craze initiation was observed from particle interfaces even though such particles interacted quite effectively with growing crazes. (13 refs.)

120485 A general model for the ESC of polyethylene in weak-swelling liquids. M.E.R.Shanahan, J.Schultz (Ecole Nat. Superieure de Chimie de Mulhouse, Mulhouse, France).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.30/1-6
The environmental stress cracking of a low-density polyethylene in weak-swelling liquids has been studied using a simple tensile creep to failure test. Three basic zones of behaviour have been shown to exist, depending on the stress level, the viscosity of the liquid and the wetting propensity of the liquid for the solid. A second order effect has also been found, which correlates with the sorption of the liquid by the polymer. (11 refs.)

81.60B Metals and alloys

(inc. stress corrosion cracking; anticorrosion)

120486 Factors influencing the susceptibility to intergranular attack, stress corrosion cracking and de-alloying attack of aluminium brass. F.Mazza, S.Torchio (Dept. of Phys. Chem. & Electrochem., Univ. of Milan, Milan, Italy).
Corros. Sci. (GB), vol.23, no.10, p.1053-72 (1983).
The occurrence and the severity of intergranular attack (IGA), stress corrosion cracking (SCC) and de-alloying attack in Al brass alloys have been investigated in an acidic chloride-citrate solution. Tests performed on laboratory prepared alloys, in which As and P additions were made in order to cover the whole composition range admitted by various nationsal specifications, indicated that the susceptibility to the different forms of localized corrosion is mainly related to the As and P contents and it can be markedly influenced by tempering treatments and by cold-working. The optimum corrosion performances of Al brass are displayed by alloys containing As in the 0.01-0.04% range and $P\leq0.0025\%$. (27 refs.)

120487 The corrosion behaviour of AISI 304 stainless steel in 0.1 M HCl at room temperature. III. The effect of sensitization. G.Salvago, D.Sinigaglia (Dept. of Appl. Phys. Chem., Polytech. di Milano, Milano, Italy).
Corros. Sci. (GB), vol.23, no.10, p.1073-84 (1983).
For pt.II see ibid., vol.23, p.1073 (1983). Describes the results of a study concerning the influence of sensitization upon the corrosion behavior of an AISI 304 in 0.1 M HCl at room temperature. Electrochemical tests show that sensitized steel requires long periods of time in order to reach quasi-stationary conditions, and that there is no potential field that guarantees a negligible propagation of the corrosive attack. Behavior in the passive state can depend upon behavior in the active region, due to the formation of corrosion products which are capable of inhibiting the anodic process, and of preventing the formation or facilitating the local destruction of passivity films. The metallurgical heterogeneity resulting from steel sensitization promotes the formation of inhibiting products in the active region, thus preventing a state of stable passivity to exist. The improvement in resistance to localized corrosion when molybdenum is added as an alloying element is attributed, at least in part, to a reduction in the corrosion rate in the active region. (15 refs.)

120488 Corrosion behaviour of hot-pressed austenitic stainless steel in H_2SO_4 solutions at room temperature. D.Itzhak, E.Aghion (Materials Engng. Dept., Ben-Gurion Univ. of the Negev, Beer Sheva, Israel).
Corros. Sci. (GB), vol.23, no.10, p.1085-94 (1983).
The corrosion behavior of hot-pressed stainless steel (HPSS) of type 316 was investigated. Samples of HPSS with porosity of 10-30% were prepared. The influence of the porosity factor on corrosion behaviour was investigated by potentiodynamic polarization, open circuit potential identification of corrosion products by EDAX and SEM observation. It was found that porosity of the HPSS is the main factor affecting corrosion resistance. High porosity results in low corrosion resistance. The open circuit potential of the HPSS is about −200 mV (VSCE) as compared to 200 mV for the wrought 316 stainless steel. The potentiodynamic measurements indicate that cathodic concentration polarization is achieved at a relatively low current density and secondary active-passive transition is observed at a relatively high current density in HPSS as compared to wrought 316 stainless steel. (10 refs.)

120489 The pitting corrosion of copper tubes in hot water. I.Suzuki, Y.Ishikawa, Y.Hisamatsu (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Corros. Sci. (GB), vol.23, no.10, p.1095-106 (1983).
The electrode potential of copper tube used in hot water distribution systems in buildings rises gradually with time of exposure and then attains to a critical value of pitting potential after a long incubation period. The process of potential rise proceeds in two stages. The first stage is the formation of a cuprous oxide layer in the potential range ≤ 60 mV(SCE) and the second stage is due to the reactions of chlorite ions accumulated in the cuprous oxide layer in the potential range >60 mV(SCE). Oxyacids and oxyanions of chlorine formed in the water, to which chlorine gas or hypochlorite was added for sterilizing process, accelerate the formation of cuprous oxide layer in the first stage, and the reaction of chlorite ions increases the electrode potential of copper tube in the second stage. (7 refs.)

120490 Characteristic features of alloy polarization curves. H.W.Pickering (Dept. of Materials Sci. & Engng., Pennsylvania State Univ., University Park, PA, USA).
Corros. Sci. (GB), vol.23, no.10, p.1107-20 (1983).
The different tendencies for dissolution of the individual components of alloys produce unique polarization behavior that is not seen in pure metals. This behavior, which is just as prevalent in base metal as in noble metal alloys, is often obscured in the polarization curves by other reactions, e.g. H_2 evolution. Four distinct polarization regions are identified and characterized in terms of the tendency for selective dissolution, surface enrichment of the more noble component and the stability of a planar surface. The greater the difference in the standard reduction potentials of the metals in the alloy, ΔE°, the more pronounced are the alloy features. The alloy composition is important in determining which alloy features occur. Stress corrosion susceptibility is greatest for one type of alloy dissolution. (42 refs.)

120491 The effect of focused ultrasound on the electrochemical passivity of iron in sulfuric acid. R.C.Alkire, S.Perusich (Dept. of Chem. Engng., Univ. of Illinois, Urbana, IL, USA).
Corros. Sci. (GB), vol.23, no.10, p.1121-32 (1983).
Focused ultrasound was used to study passivity of pure iron in 2 N H_2SO_4. Ultrasonic waves were used to depassivate a passive surface film and influence the subsequent repassivation process. A curved piezo-electric transducer produced high frequency ultrasonic waves which created cavitation at the focal point. Acoustic focal intensities up to 3.4 kW cm^{-2} were generated. Low frequency ultrasound was produced with a commerical sonicator equipped with an exponential microhorn. At high focal intensities (above 1.5 kW cm^{-2}) a single (100 ms) pulse of ultrasound produced depassivation; at low intensities continuous ultrasonic exposure was required. In all cases, the induced depassivation was followed by precipitation of a metal salt film upon the metal surface before the oxide film formation. (19 refs.)

120492 Electrochemical studies of crevice corrosion rates on stainles steels. D.Tromans (Dept. of Metall. Engng., Univ. of British Columbia, Vancouver, BC, Canada), L.Frederick.
Corrosion (USA), vol.39, no.8, p.305-12 (Aug. 1983).
A crevice corrosion cell was designed to utilize electrochemical techniques for the quantitative determination of crevice corrosion rates in three commercial austenitic stainless steels, AISI 304, 316L, and UHB 904L. Studies were conducted on Teflon/metal crevices exposed to 1 M NaCl at 22 and 55 C. Crevice corrosion current, electrochemical potential, and pH could be monitored. In addition, the area and location of each crevice corrosion site was determined in order that the data could be evaluated in terms of both the crevice corrosion site was determined in order that the data could be evaluated in terms of both the crevice corrosion current density (i) and potential (E) at the local site. These data were compared with anodic polarization studies in simulated crevice solutions. The study demonstrated the superiority of 904L; the interplay of i, E, and local solution chemistry upon crevice corrosion behavior; and allowed discussion of general guidelines for industrial monitoring of crevice corrosion. (21 refs.)

120493 The effect of dissolved oxygen and NO_3^- anions on the stress corrosion cracking of type 304 stainless steel in water at 290 C. H.Hirano (Energy & Environment Lab., Central Res. Inst. of Electric Power Industry, Tokyo, Japan), N.Aoki, T.Kurosawa.
Corrosion (USA), vol.39, no.8, p.313-22 (Aug. 1983).
The effect of dissolved oxygen and NO_3^- anions on the intergranular stress corrosion cracking (IGSCC) and transgranular stress corrosion cracking (TGSCC) of type 304 stainless steel has been studied in water at 290 C by using the constant extension rate tests (CERT) method. A strain rate of 3.33×10^{-6} sec^{-1} was applied. TGSCC occurred in water containing less than 100 ppb dissolved oxygen, while IGSCC occured at concentrations greater than 1 ppm dissolved oxygen. IGSCC was accelerated by the addition of small amounts of NO_3^- anions, but TGSCC was suppressed by the presence of this anion. The analyses of oxide films by the ion microprobe mass analyzer (IMMA) and the construction of potential-pH diagrams for Cr-H_2O, Ni-H_2O, and Fe-H_2O systems at 290 C were performed to consider the effect of dissolved oxygen and NO_3^- anions on IGSCC and TGSCC. The IMMA studies revealed that the compositions of the oxide films of type 304 stainless steel and Fe-12Cr-9.3Ni steel (the presumed composition of grain boundaries in sensitized type 304 stainless steel) were Cr-enriched at 200 ppb O_2 level. At 1 ppm O_2 level, the oxide film of type 304 stainless steel was composed of Cr-enriched phase, but the Cr content in the oxide film of Fe-12Cr-9.3Ni steel was low. At 10 ppm O_2 level, the oxide film of type 304 stainless steel was composed of Fe and Cr, but the oxide film of Fe-12Cr-9.3Ni steel was mainly composed of Fe. (27 refs.)

120494 Corrosion cracking phenomena under different polarizing and microstructural conditions in a 304 stainless steel tested in low temperature acid solutions. K.Bilogan (Dept. of Metall. & Engng. Materials, Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Corrosion (USA), vol.39, no.8, p.323-9 (Aug. 1983).
Experiments have shown that for the various microstructural conditions of 304 type stainless steels (i.e. annealed, cold worked, and dynamically recrystallized), there was no evidence of cracking in specimens tested under freely corroding conditions. At the more active potentials (i.e. -500 to -1000 mV s.c.e.), an increased susceptibility to cracking was observed, reaching a mazimum within the potential range from -500 to -800 mV s.c.e. However, the tests performed under conditions of slow dynamic straining showed that increased amounts of previous cold work have damaging effects upon the cracking susceptibility, while all refrigeration treatments have a slight beneficial effect on cracking resistance at the more active potentials. (14 refs.)

120495 Anodic polarization characteristics of sensitized 304 austenitic stainless steel in polythionic acid environment. S.Ahmed (Dept. of Metall. Engng., Univ. of Roorkee, Roorkee, India), M.L.Mehta, S.K.Saraf, I.P.Saraswat.
Corrosion (USA), vol.39, no.8, p.330-3 (Aug. 1983).
An attempt has been made to establish anodic polarization characteristics of sensitized 304 stainless steel in Samans solution, which represents the polythionic acid environment formed in equipment during shutdown in the petroleum industry, and the various constituents of Samans solution. (14 refs.)

120496 Effect of polythionic acid concentration on stress corrosion cracking of sensitized 304 austenitic stainless steel. S.Ahmad (Dept. of Metall. Engng., Univ. of Roorkee, Roorkee, India), M.L.Mehta, S.K.Saraf, I.P.Saraswat.
Corrosion (USA), vol.39, no.8, p.333-8 (Aug. 1983).
Stress corrosion tests using U-bend specimens were carried out in Samans solutions containing polythionic acid concentrations from 0.03 moles/liter to 0.38 moles/liter. Results reveal that the stress corrosion life decreases rapidly on increasing the concentration from 0.03 to 0.18 moles/liter, but a further increase up to 0.38 moles/liter had a small effect. Stress corrosion tests were also carried out in individual thionic acid solutions in order to identify the chemical species causing SCC. The chemical analysis of the test solutions both prior to and subsequent to stress corrosion tests was also carried out. Some model tests were performed in order to ascertain the role of oxygen on SCC. The study of the change in corrosion potential with respect to time during stress corrosion tests suggest a potential range from -36 to -86 mV in which cracking occurs. (13 refs.)

120497 Surface oxidation of molten soft solder: an Auger study. E.E.de Kluizenaar (Metall. Lab., N.V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1480-5 (1983).
The composition of oxide films, formed on stagnant, molten soft solder has been studied. The influence of oxidation time and of solder composition on the oxide films was measured. On clean soft solder SnPb60-40 a complex oxide film was formed, consisting of a thin outer layer of SnO_2, a layer of SnO mixed with metallic lead, and a transition layer to the underlying solder metal. The same type of oxide layer was formed on solder with copper or with nickel. On soft solder contaminated with aluminium, zinc, or phosphorus the contaminants were preferentially oxidized, resulting in an aluminium oxide film, a zinc oxide film, and a mixed phosphorus oxide-tin oxide film, respectively. (10 refs.)

120498 Mechanical scraper for preparing clean soft metal surfaces in UHV. T.G.Kinisky, J.A.Psioda (Union Carbide Corp., Central Sci. Lab., Tarrytown, NY, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1566-8 (1983). (no refs.)

120499 Pretreatment of metallic materials for the electrodeposition of functional coatings also on rarely used metals. H.Simon.
Galvanotechnik (Germany), vol.74, no.7, p.766-71 (July 1983). In German.
There are special requirements for functional coatings with regard to their adhesion wear or abrasion resistance, their ability to withstand stress corrosion cracking, mechanical flexure, etc. These properties are also determined by the nature of the pretreatment, which is therefore of special importance in functional plating. The choice of the process for pretreatment is made more difficult because of the fact that the functional coatings are often applied on unusual, alloyed or otherwise treated basis materials. In the article, suitable processes for different conditions of service on various basis materials are presented in tabular form, whilst the processes for pretreatment and their influence on the basis metal surfaces are described. Special sections also deal with the processes of stress relieving and the degassing of hydrogen embrittled components, as well as some methods of determining adhesion. (3 refs.)

120500 Electroless nickelplating of molybdenum-containing nickel steels. F.J.Gammel, H.Nagel, O.Tuscher, R.Suchentrunk.
Galvanotechnik (Germany), vol.74, no.7, p.772-3 (July 1983). In German.
Molybdenum behaves passively in solutions which are employed in the conventional pretreatment processes accumulates on the surface and is consequently coated non-adherently with nickel. This results in cracking off and the formation of blisters on subsequent stressing. By a new process for the pretreatment of surfaces, which consists essentially of a pickle for the removal of scale and a special activation operation, it is possible to coat steels also with adherent, stressable nickel coatings electrolessly. (8 refs.)

120501 Pretreatment for the electrolytic coating of super-alloys. M.Thoma.
Galvanotechnik (Germany), vol.74, no.7, p.774-81 (July 1983). In German.
Stainless austenitic steels and super-alloys can be electroplated with a satisfactory degree of adhesion with suitable pretreatment. Anodic pretreatment processes under certain conditions produce better adhesion than chemical processes. It is possible to increase the adhesion to such an extent that the tensile strength of the nickel deposit is exceeded so that the failure occurs in the nickel. If it is necessary to replace electrolytic processes by chemical methods on account of their operational disadvantages, this can be done with Nimonic 75 without loss in quality: with other basis materials in the range described, the possibility must be checked in each particular case. (7 refs.)

120502 Anodic protection of stainless steels type 304 and type 316 in sulphuric acid. T.P.Sastry, V.V.Rao (Dept. of Chem., S.V. Regional Coll. of Engng. & Technol., Surat, India).
Indian J. Technol., vol.21, no.3, p.109-14 (March 1983). [received: Oct. 1983]
The corrosion of stainless steels type 304 and type 316 in sulphuric acid of concentrations up to 15 *N* and temperatures up to 75°C can be controlled to a very large degree by application of anodic protection. Parameters necessary for such anodic protection have been evolved at different concentrations and temperatures. By making use of these parameters it is shown that the efficiency of protection is of the order of 99.9% in all the cases reported. (24 refs.)

120503 Role of misch metal in galvanizing with a Zn-5%Al alloy. S.F.Radtke, D.C.Herrschaft (Internat. Lead Zinc Res. Organization Inc., New York, NY, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.253-9 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The properties and advantages of Galfan (a Zn-5%Al-0.05% misch metal alloy) as a corrosion-resistant coating for steel sheet and wire are described. Galfan is superior, with regard to corrosion resistance and formability, to standard galvanized steel sheet and wire of equal coating thickness and has comparable properties with regard to paintability and weldability. (6 refs.)

120504 Influence of rare earths on wrinkle formation in the scale of Fe-Cr-Al alloy. Li Bei, Li Peiliang, Wang Limin (Baotou Res. Inst. of Metall., Baotou, Mongolia).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.277 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given, as follows. When Fe-Cr-Al alloys were oxidized in air in the temperature range 800-1300°C the thermal etching pits of the dislocation formed on the alloy surface developed into grooves as a result of the dislocation movement. This led to the formation of numerous wrinkles in the oxide scale. No wrinkles were formed in the presence of rare earths (REs) because they prevented the formation of thermal etching pits on the alloy surface. The REs also inhibited the occurrence of thermal etching at grain boundaries and in the matrix surrounding the inclusions and the carbides on the alloy surface, and hence prevented the formation of voids at the oxide-alloy interface. This behaviour may be due to the interaction of the RE atoms with crystal defects in the alloy.

120505 The application of X-ray photoelectron spectroscopy to the study of polymer-to-metal adhesion. I. Polybutadiene coated mild steel. J.F.Watts, J.E.Castle (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).
J. Mater. Sci. (GB), vol.18, no.10, p.2987-3003 (Oct. 1983).
The nature of polybutadiene to mild steel adhesion has been characterized by X-ray photoelectron spectroscopy (XPS) used in conjunction with a novel oxide stripping/argon ion bombardment technique for interface analysis. It is concluded that the interface is more correctly described as an interphase region. The failure mode of the polybutadiene/steel couple has been determined for mechanical delamination, and corrosion induced failure; both at the free corrosion potential (FCP), and when cathodically protected. Cohesive failure of the polymer occurred in the two former instances, but when cathodically protected the film is observed to separate in two stages. These results are discussed in relation to underfilm pH and the possible importance of oxide reduction to coatings delamination from cathodically protected structures. (22 refs.)

120506 Mechanical properties of molybdenum coated with titanium carbide film. T.Shikama, H.Shinno, M.Fukutomi, M.Fujitsuka, M.Okada (Nat. Res. Inst. for Metals, Ibaraki, Japan).
J. Mater. Sci. (GB), vol.18, no.10, p.3092-8 (Oct. 1983).
TiC-coated molybdenum is mechanically tensile tested. The 6-μm thick TiC-coated molybdenum has a higher 0.2% proof strength with a slight decrease in uniform and rupture elongation than the uncoated one. This strengthening effect of the TiC coating can be explained by the constrained effect of the high strength TiC film. The 1.2 μm thick TiC-coated molybdenum starts its plastic deformation at a lower stress than the uncoated one. Also, the coating makes the stress-strain curve more smooth. These effects are attributed to the surface effect, namely, that the interface between the molybdenum substrate and the strong and brittle TiC film acts as a strong dislocation source. The compressive stress in the TiC film will also help the start of plastic deformation at lower external stresses. (9 refs.)

120507 Mechanical behaviour of TiC film coated on molybdenum by magnetron sputtering. T.Shikama, H.Shinno, M.Fukutomi, M.Fujitsuka, M.Okada (Nat. Res. Inst. for Metals, Ibaraki, Japan).
J. Mater. Sci. (GB), vol.18, no.10, p.3099-104 (Oct. 1983).
The TiC film, which is coated on molybdenum by magnetron-sputtering, is analysed after the molybdenum substrate is tensile-tested to rupture at 300 to 1070K. At 300K some portion of the film exfoliated during the molybdenum substrate deformation. The degree of exfoliation is proportional to the substrate strain up to about 30% elongation, and is proportional to the square root of the film thickness. The maximum shear stress which is generated at the interface between the film and the substrate during the deformation is estimated by the measurement of the distance between cracks. From the estimated maximum shear stress, the adhesive strength of the present TiC film is evaluated to be about 400 MN m^{-2}. (4 refs.)

120508 Heat flow during the laser transformation hardening of cylindrical bodies. S.Kou, D.K.Sun (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1859-67 (Sept. 1983).
A heat flow model as developed for the laser transformation hardening of cylindrical bodies. Three different cases of surface hardening were considered, i.e. the surface of a solid cylinder, outer surface of a hollow cylinder, and the inner surface of a hollow cylinder. The thermal responses of the workpiece in these three different cases were compared and discussed. The validity of the model was verified with experimental results obtained on 4140 steel. The effects of operating conditions on heat flow and the surface hardening of the workpiece was discussed. These operating conditions are the travel speed of the workpiece, the power unit, the width of the laser beam on the surface of the workpiece, and the cooling of the workpiece. In order to provide general heat flow information, calculated results based on dimensionless variables were presented. (11 refs.)

120509 Enhanced stress corrosion resistance from steels having a dual-phase austenite-martensite microstructure. T.V.Venkatasubramanian, T.J.Baker (Dept. of Metall. & Materials Sci., Imperial Coll. of Sci. & Technol., London, England).
Metall. Trans. A (USA), vol.14A, no.9, p.1921-8 (Sept. 1983).
A high strength steel with an austenite-martensite duplex microstructure has been produced by extruding nickel coated steel powder. The austenite is stable and is present as a continuous network surrounding a high strength martensite. The dual-phase steel exhibits superior resistance to stress corrosion cracking in 3.5 pct NaCl solution, compared with steels of similar strength having conventional microstructures. Also, the effectiveness of the austenite in improving stress corrosion cracking resistance increases as the yield strength increases. The austenite, because of its inherent toughness, reduces the effective stress intensity at the advancing crack tip, and at the same time shields the crack tip from the corrosive environment. (7 refs.)

120510 Inhibition of corrosion of nickel in different acids by organic compounds. A.Maitra, K.Bhattacharyya, G.Singh (Dept. of Chem., Univ. of Delhi, Delhi, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.49, no.1, p.143-8 (1983).
The inhibition characteristics of dicyandiamide and biguanide have been studied during the acid corrosion of nickel in 'air saturated solutions' at room temperature. It has been found that the inhibition efficiencies of these compounds vary substantially depending on the nature of the acids used. Dicyandiamide acts as an inhibitor in all the three acids investigated. Biguanide, however, catalyses the dissolution of nickel in sulphuric acid but is a better inhibitor in perchloric acid. (21 refs.)

120511 Diffusion instability of the steady-state oxidation of metals. N.R.Anisimov.
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.569-70 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR),* vol.8, no.21-22, p.1320-3 (Nov. 1982). [received: Sept. 1983]
The high-temperature oxidation of metals is described satisfactorily by the diffusion theory of oxidation. In steady-state oxidation, a temperature corresponding to the thermal equilibrium between the heated sample and the surrounding medium is established. The stability of this steady-state oxidation has not been studied previously. It is shown in this letter that undamped temperature oscillations may be driven by an instability of the thermal equilibrium. The instability results from the temporal delay in the thermal effect of the chemical reaction upon a change in the temperature. A sharp increase in the temperature of the oxide film due to an acceleration of the chemical reaction is accompanied by a decrease in the surface concentration of metal ions; as a result, the diffusion of these ions toward the oxide surface accelerates. The diffusion flux density initially reaches a maximum and then drops back to a value corresponding to the steady-state density profile at the higher temperature. The power evolved by the exothermic reaction will vary in the same way. Initially, therefore, this power may exceed the heat loss (even if the heat loss is greater for the steady-state ion flux density), causing a further increase in the temperature. The period of the temperature oscillation is on the order of the diffusion relaxation time of the concentration profile in the oxide film. (4 refs.)

120512 Microsctructure and composition of borided refractory metals. H.R.Vetters, P.Mayr (Stiftung Inst. fuer Haerterei-Tech., Bremen, Germany).
Scanning Electron Microsc. (USA), pt.1, p.105-11 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
Methods of chemical extraction and ion beam etching have made possible the investigation of shape, size and spatial arrangement of microstructural details by means of scanning electron microscopy (SEM) and transmission electron microscopy (TEM). As a result the performance of thermochemically produced boride coatings on refractory metals (niobium, molybdenum, tantalum, tungsten) used to enhance wear and corrosion protection was found to strongly depend upon the phase composition, the shape of the boundary and the thickness of the boride layer. The gradual decrease of the boron content across the boundary, carried out by electron probe microanalysis (EPMA) and electron diffraction (ED), manifested and the existence of various boride phases. SEM investigations indicated that the growth of the boride case into the base material may be influenced by epitaxial effects. Bending tests lead to the conclusion that the toughness of the boride layers dpends upon the properties of the core metal. (14 refs.)

120513 Oxidation of molten Al-Mg alloys. I.Haginoya (Tokyo Metropolitan Industrial Technol. Center, Tokyo, Japan), T.Fukusako.
Trans. Jpn. Inst. Met. (Japan), vol.24, no.9, p.613-19 (Sept. 1983).
The oxidation mechanism of molten Al-Mg alloys was studied by means of a thermal balance, X-ray diffraction and EPMA. Oxides produced in the Al-Mg (2-12%) alloys oxidized at 923K to 1173K for 10.8 ks (3 h) were MgO or/and $MgAl_2O_4$. MgO was produced in an early stage of oxidation, and its amount increased temporarily and then decreased gradually. $MgAl_2O_4$ increased gradually in amount with decreasing amount of MgO. The oxidation reactions were indicated by the equations, $Mg+1/2O_2 \rightarrow MgO$ and $MgO+2Al+3/2O_2 \rightarrow MgAl_2O_4$, which were the consecutive reaction. MgO was produced in the form of granules around pores opened to the alloy surface and was irregularly distributed near the surface of the molten alloy. $MgAl_2O_4$ crystallized into a spinel structure from amorphous oxide and formed a homogeneously mixed layer composed of the fine oxide particles and metal. (5 refs.)

120514 Cathodic protection system fights against underground cable corrosion. R.Woyciehowsky (Bell Telephone Co., Reno, NE, USA), B.McClish, A.Bennett.
Telephony (USA), vol.205, no.10, p.38, 41-2 (29 Aug. 1983).
This article, directed primarily to development of a cathodic protection system, outlines the procedures necessary to establish and maintain a campaign to offset the effects of corrosion through the use of impressed current rectifiers. First, however, it is important to realize that there are other forms of corrosion and that basic precautions need to be taken to guard against them. (no refs.)

120515 Weibull's distribution of time to stress corrosion cracking of Cu-Zn alloys. T.Yamane, K.Hirao, K.Yoshimoto (Dept. of Materials Sci. & Engng., Osaka Univ., Suita, Japan), T.Oka, Y.Takeda.
Z. Metallkd. (Germany), vol.74, no.9, p.603-6 (Sept. 1983).
Stress corrosion cracking tests were performed. The time to the initiation of cracks, the time for the propagation of cracks and the time to fracture of annealed Cu-Zn alloys have Weibull's double or more distributions and in some cases a single distribution. The cold rolled alloys have Weibull's single distribution only. (8 refs.)

120516 Studio della decarburazione e scagliatura nei forni di riscaldo per laminazione a caldo (Study of the decarbunization and scaling ocurring in reheating furnaces for hot rolling).
Report EUR 7816 IT, Comm. European Communities, Luxembourg (1983), 118 pp. In Italian. Contract 7210.EA/407.
Oxidation and decarburization experiments have been carried out using spring steel (SAE 9262), ball bearing steel (UNI 100 Cr 6) and fastener steel (C35 BKB) and gaseous mixtures that simulate the atmosphere produced by the combustion of air methane mixtures with ratios of 1:11 and 1:14. The objective was to obtain a generalized and reliable description of the phenomena in order to simulate the actual scaling and decarburization occurring in commercial reheating furnaces. Isothermal test showed that the scaling rate is controlled by the diffusion of oxidizing gases across the gaseous boundary film and by the diffusion of the Fe^{+2} ions through the wustite (FeO) layer. The rate-determining steps of the decarburization process are the chemical reaction forming CO at the steel/scale interface and carbon diffusion within the bulk of the steel. The comparison between the values of the kinetic constants measured experimentally and those calculated theoretically shows satisfactory agreement. Using the values obtained from the isothermal test the progress of the oxidation and decarburisation reactions has been predicted for a simplified time/temperature profile similar to that in reheating furnace.

81.70 MATERIALS TESTING

(inc. sample preparation for examination, metallographic techniques, ion and electron microprobe techniques, Auger and photoelectron techniques, defectoscopy; for measurement in the mechanics of solids and rheology, see 46.30R)

120517 Dynamic mechanical spectroscopy of sheet molding compound as a function of offset stress. K.Ard, H.Kolman, K.Venkataswamy, K.Stephens, C.L.Beatty (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
Polym. Compos. (USA), vol.4, no.3, p.183-4 (July 1983).
It has been determined that preload and cyclic amplitude have significant effect on the results of dynamic mechanical measurements of tan δ. To illustrate the effects on composities, a particular type of sheet molding compound (SMC-R50) was used in this study. In addition to the effects of preload and cycle amplitude, the effects of frequency, and creep prior to dynamic mechanical testing were also investigated. Dynamic mechanical spectroscopy of composite materials may offer a nondestructive approach to determining if reversible microscopc delamination occurs and, in addition, the extent to which delamination occurs may be quantifiable by further development of this approach. (4 refs.)

120518 On the temperature- and cyclic speed-dependence of the method of stress measurement using iron-foils. S.Kitaoka, Y.Nagase (Faculty of Engng., Nagoya Univ., Nagoya, Japan), H.Maehata, M.Seika.
Bull. JSME (Japan), vol.26, no.216, p.938-45 (June 1983).
The authors apply the method of stress measurement using iron-foils to machine elements subjected to various service loads. Effects of variable temperatures in both high and low temperature ranges and fluctuating speeds of cyclic loads at room temperature on the critical stress of slip initiation in the iron-foil owing to fatigue are examined. The applicable test temperature range of the present method at low temperatures is also investigated. Based on the test results, stress-concentration factors in notched specimens are obtained at various fluctuating temperatures. It is concluded that the present method can be adopted for the stress measurement at variable temperatures in the range from −90°C to 400°C with sufficient accuracy. (9 refs.)

120519 The influence of magnetization on eddy current inspection of ferromagnetic tubes. V.Kelha, R.Peltonen.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.76-9 (1983).
The eddy current method is commonly used for inspecting metal tubes during manufacture. Inservice inspection, however, has been limited to the testing of nonferroamagnetic tubes due to the inherent magnetic noise. In this work it has been shown that even mild steel tubes, if magnetically saturated, can be satisfactorily inspected using the eddy current method. By using a laboratory electromagnet and the magnetizing field 2.4 to 360 kA/m, various artificial defects, through holes 0.5 to 2.5 mm in diameter, a conical hole and a groove on the outer surface of the tube, were detected by an internal differential eddy current probe. The signal level and the signal-to-noise ratio increased remarkably with increasing magnetization. (6 refs.)

120520 Applications of 3-D nuclear scattering radiography in technology and medicine. G.Charpak, J.C.Duchazeaubeneix, J.C.Faivre, D.Garreta, B.Guillerminet, D.Legrand, M.Rouger, J.C.Santiard, J.Saudinos, F.Sauli (CENS, Gif-sur-Yvette, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.156-63 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
The method presented relies on nuclear interaction but one of its attractive features is to yield a true three-dimensional view of the density distribution without any relative rotation or displacement of the beam and the object. This method, nuclear scattering radiography (NSR), is based on the strong nuclear interaction: when protons in the 1 GeV energy range are scattered by matter, the large angle deflections are produced mainly by the nuclear collisions of the proton on the protons or neutrons bound in the nuclei contained in the molecules of the object; in this range of proton beam energy, the collision has nearly the character of an elastic encounter between particles of the same mass. By measuring the trajectories of the incoming and outgoing charged particles, one obtains the space coordinates of the interaction vertices whose density distribution reflects the matter distribution in the bombarded body. The trajectories are obtained from routine techniques in high energy physics: planar localization detectors, like multiwire proportional chambers, two in front of and two after the object determines the incident and scattered trajectories which are in time coincidence. A three-dimensional matrix, a volume-image, is defined. Thus, this method is deeply different to the methods of radiography by X-ray or γ absorption in which the information on the radiographed object is integrated along beam-rays (projections). 120521 Application of instrumented impact testing for studying dynamic fracture behaviour of rotor steels. K.N.Murty, N.K.Rao, H.Krishnan (Metall. Dept., Bharat Heavy Electricals Ltd., Hyderabad, India).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1173-84 (1983).
The viability of the instrumented Charpy impact testing for studying dynamic fracture behaviour of rotor steels is investigated. This encompasses determination of dynamic fracture toughness (K_{Id}) and dynamic J-integral (J_{Id}), establishing correlation between oscilloscope profiles and fracture morphology of the ruptured samples and identifying fracture mechanisms involved. The predicted oscilloscope profiles for common fracture modes, their experimental counterparts, and the inferences drawn from these concerning operating fracture mechanisms are in good accord with the fractographic observations made on broken samples. It is possible that the deduced J_{Id} values correspond to a small but finite amount of crack extension instead of zero crack extension in line with the emerging trends of J_{Id} estimation. Apart from increasing with temperature, both parameters recorded a true transition around 35°C which is attributed to the combined influenced of a change in the fracture mode and relaxation of crack tip constraint. Another significant outcome of this investigation concerns about the existence of a minimum crack depth ratio for valid J_{Id} determination which, based on a detailed fractographic study, is interpreted in terms of the collective influence of crack tip plasticity and notch constraint. (20 refs.)

120522 X-ray axial tomographic system employing X-ray film for industrial applications. P.B.Pickar (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3B, p.1503-5 (Aug. 1983).
The present system allows one to observe defects in a thin slice of the object being studied without any interference from adjacent layers; in fact tomographs of adjacent layers can be added together to give the sum of the whole object. (no refs.)

120523 Isotope method detecting the hydride phase in palladium saturated with hydrogen. V.A.Gol'tsov, B.A.Lovanov (Donetsk Polytech. Inst., Donetsk, USSR).
Ind. Lab. (USA), vol.48, no.12, p.1198-201 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.43-5 (Dec. 1982). [received: Sept. 1983]
The method of autoradiography was used for detecting the hydride phase in palladium. A diaphragm specimen of palladium was preactivated with tritium by saturation to contents not exceeding its content in the α solid solution. Subsequently, the diaphragm specimen was saturated with hydrogen in such a manner as to ensure that the formation of the hydride phase was accompanied by the appropriate redistribution of tritium atoms and the hydride precipitates were marked by these atoms. Since the introduction of hydrogen isotopes at room temperature by diffusion through one side of the diaphragm results in the accumulation of hydrogen in the near-surface layer on the other side of the diaphragm, the autoradiographic examination of the external surface of the specimen will yield the pattern of distribution of the hydride phase in the specimens. It should be mentioned that to prevent the breakdown of the β phase, the specimens must be shielded by hydrogen during exposure of the emulsion. (13 refs.)

120524 Investigation of the surface finish of aluminium metallization by the photometry method of dissipated radiation. B.M.Voronov, M.S.Finarev.
Ind. Lab. (USA), vol.48, no.12, p.1201-4 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.45-7 (Dec. 1982). [received: Sept. 1983]
The method was used to investigation 0.5 μm thick aluminium films on oxidised silicon plates formed by evaporation of aluminium pieces with a tungsten resistance evaporator. (9 refs.)

120525 Planning and statistical processing of the results of tests for plotting quantile fatigue curves. M.N.Stepnov, L.V.Agamirov (Tsiolkovskii Aeronautical Engng. Inst., Moscow, USSR).
Ind. Lab. (USA), vol.48, no.12, p.1212-16 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.52-5 (Dec. 1982). [received: Sept. 1983]
Establishes confidence limits for the quantile values of the fatigue strengths in connection with plotting fatigue curves, and also develops a procedure for the planning of fatigue tests. A normal distribution function is adopted as the hypothetical distribution of the logarithm of the fatigue life and the fatigue strength. (8 refs.)

120526 Method of investigating the rules of deformation and failure under conditions of low-cycle nonisothermal loading. A.I.Bashunin, P.I.Kotov (Moscow Inst. of Marine Transport Engng., Moscow, USSR).
Ind. Lab. (USA), vol.48, no.12, p.1216-19 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.55-7 (Dec. 1982). [received: Sept. 1983]
Proposes a method of low cycle fatigue testing under conditions of a variable temperature without holds which has been tested on a type UME- 10TM standard production machine. The method makes it possible to investigate the resistance to deformation and failure of materials with recording of the elastoplastic hysteresis curves to stress vs mechanical strain coordinates with combinations of different methods of thermomechanical loading. (6 refs.)

120527 Determination of the ductile-brittle transition temperature of steels for the elements of fastening parts of power equipment. V.V.Anikovskii, Yu.I.Zvezdin, V.A.Ignatov, V.I.Smirnov, B.T.Timofeev.
Ind. Lab. (USA), vol.48, no.12, p.1219-25 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.58-62 (Dec. 1982). [received: Sept. 1983]
The curve of the analysis of the condition for power equipment bolts was constructed and experimentally checked, making it possible, despite some conditionality, to establish the level of the work for failure of standard impact samples on the basis of which it is desirable to designate the value of the ductile-brittle transformation temperature of bolt steels. It is concluded that determining the parameters of fracture toughness it is important to take into consideration the specific features of a large bolt. In particular, it is necessary to test cylindrical samples with an edge segment-shaped crack, which makes it possible to obtain an approximate determination of t_{cr}. The most justified method of determining the t_{cr} of a bolt is to use not the temperature t_n obtained from an analysis of the dimorphism of failure but the ductile-brittle transformation temperature obtained by recording the moment of start of a crack, which provides independence of the parameter t_{cr} in a broad range of change in sample dimensions, since K_i does not depend upon the scale factor. (14 refs.)

120528 Device for tensile testing of brittle materials. A.K.Khersonskii, V.T.Kononenko (Sci. Production Group for Mechanization & Automation of Cotton Industry Equipment, Tachkent, USSR).
Ind. Lab. (USA), vol.48, no.12, p.1225-7 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.62-3 (Dec. 1982). [received: Sept. 1983]
A small (100×210×191 mm) device is described for determining the ultimate strength of brittle metallic materials under uniaxial tensile load. The design features of this device ensure high measurement accuracy due to constantly uniaxial loading and strain vectors, the absence of stress concentration at the specimen ends and points of its gripping, as well as the possibility of strain rate control and of constant fixing of both specimen end during the test. (6 refs.)

120529 Heating unit for high-temperature mechanical tests. L.G.Puzrin, E.I.Peshcherin, V.M.Makedonskii, V.M.Kravchenko, V.A.Zdanevich (E.O. Paton Electric Welding Inst., Acad. of Sci., Ukrainian SSR).
Ind. Lab. (USA), vol.48, no.12, p.1227-8 (Dec. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.12, p.64-5 (Dec. 1982). [received: Sept. 1983]
A heating unit has been developed for a temperature range of up to 1200°C. The unit is free of the shortcomings of tube-type ceramic furnaces. The main part of the unit is a heater which is a Nichrome tube mounted inside a container with insulating material, which enables the heat losses to be kept at minimum and produces the required temperature difference between the heater and the external container wall. (4 refs.)

120530 Residual stress measurements by means of neutron diffraction. L.Pintschovius, V.Jung (Kernforschungszentrum Karlsruhe, Inst. fur Angewandte Kernphys., Karlsruhe, Germany), E.Macherauch, O.Vohringer.
Mater. Sci. & Eng. (Switzerland), vol.61, no.1, p.43-50 (Oct. 1983).
A new method for the analysis of multiaxial residual stress states is presented, which is based on high resolution neutron diffraction. It is analogous to X-ray stress analysis, but the use of neutrons instead of X-rays allows the analysis of the stress distributions also in the interior of technical components in a nondestructive way. To prove the feasibility of the method, investigations of

the loading stress distributions of an aluminium bar subjected to purely elastic bending were performed. Limiting factors due to the volume of the internal probe region and the sample thickness are discussed. Complete neutron residual stress analyses were carried out for a plastically deformed bending bar and a transformation-free water-quenched steel cylinder. The results are in fairly good agreement with theoretical expectations and with X-ray control measurements at the surface of the objects. (11 refs.)

120531 Evaluation of the results of automatic ultrasonic tests and grading of heavy sheet with regard to specification using an EDV-system. G.Hullin, O.A.Barbian, G.Haralamb, E.Raeder.
Mater. Test. (Germany), vol.25, no.9, p.302-6 (Sept. 1983). In German.
The pulse-echo method was used to find the depth and extent of internal flaws which were parallel to the surface of the sheet. For tests to be made on the production line, tying of the detector which scanned the echoes to a computer made possible automatic evaluation and storing of the test data. The final presentation of the data allows the determination of the linear and two-dimensional extent of the flaws. It has been possible to combine 252 test tracks. Three microprocessors have been used for the evaluation of the scanning results. (13 refs.) *R.S.*

120532 Investigations on the application of pulsed eddy current method in nondestructive testing using controlled signals. H.A.Crostack, J.Nehring.
Mater. Test. (Germany), vol.25, no.9, p.306-10 (Sept. 1983). In German.
Eddy current testing is useful for thin-walled electrically conducting test pieces because the probes do not have to touch the test piece. Working with controlled signals allows of a better discrimination between flaw indications and rogue signals. The finding of flaws depends on their depth in the test piece and on their length. Artificial flaws in austenitic and aluminium test pieces were used for the evaluation of the method. (10 refs.) *R.S.*

120533 Studies on defect indication in ultrasonic testing by the rear wall echo method. J.Muller-Hillebrand, R.Harlfinger.
Mater. Test. (Germany), vol.25, no.9, p.311-14 (Sept. 1983). In German.
Steel balls of various sizes in water put on an aluminium plate were used to simulate defects. A linear characteristic of the rear wall echo as a function of the defect diameter was obtained. This line does not go through the origin. The spread of the ultrasonic beam affects the sensitivity of the method. This can be improved by glancing incidence of the beam. (2 refs.) *R.S.*

120534 Resolution in depth of ultrasonic testers. A.Wiese, U.Opara.
Mater. Test. (Germany), vol.25, no.9, p.315-17 (Sept. 1983). In German.
Experiments were made with an ultrasonics probe and a reflector at various distances in a water bath. The electrical circuit containing a damping resistance and a series of capacitances allowed the suppression of a large part of the low frequency components. A parallel capacitance and the internal resistance limited the high frequencies. The difference between the echo from the emitter and the echo from a flaw could be increased to about 30 dB. (2 refs.) *R.S.*

120535 Some stereological properties of hexagonal prisms. J.W.Lee, J.D.Browne, D.Jaffrey (Dept. of Metall., Univ. of Newcastle, Newcastle, NSW, Australia).
Metallography (USA), vol.16, no.3, p.255-64 (Sept. 1983).
A method is described by which the ratio of base to height in crystals of trigonal symmetry may be determined from metallographic sections of the crystals in a matrix. The method is applied to a WS-25 wt.% Co sample, liquid-phase sintered at 1400°C for 100 hr, during which the WC crystals form triangular prisms. It is shown that the prisms have a base to height ratio of 2.0 ± 0.1 and are slightly truncated along the edges parallel to the prism axis. (12 refs.)

120536 Relief etching technique for scanning and transmission electron microscopy characterization of submicron precipitates in aluminum alloys. J.Howe (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Metallography (USA), vol.16, no.3, p.275-86 (Sept. 1983).
The size, type, and distribution of insoluble dispersoids and age-hardening precipitates influence the processing and final properties of aluminum alloys, and accurate characterization of these submicron precipitates is often required. A modified version of a relief etching technique introduced by Ryvola and Morris now allows rapid determination of their size, shape, and distribution in the scanning electron microscope in addition to facilitating accurate chemical and microstructural analyses by transmission electron microscope/STEM analytic and diffraction techniques. The etching procedure is applicable to almost all second phases commonly found in aluminum alloys and is simple to use. (2 refs.)

120537 Metallographic techniques for the study of continuously cast microalloyed steels. G.Ocampo, T.Castillo, V.S.Raghunathan, J.D.Embury (Dept. of Metall. & Materials Sci., McMaster Univ., Hamilton, Ontario, Canada).
Metallography (USA), vol.16, no.3, p.287-97 (Sept. 1983).
Methods are described to investigate the evolution of the final structure from the as-cast structure in HSLA steels. By using a combination of metallographic techniques, from optical methods to analytical scanning transmission electron microscopy, it is possible to determine the distribution and composition of alloy carbonitrides and to deduce at what stage in the complex thermal history they are produced. (5 refs.)

120538 Automated cavity measurement using a region-growing algorithm. J.F.Mancuso (Dept. of Materials Engng., Westinghouse R&D Center, Pittsburgh, PA, USA), H.T.Tai, C.C.Li.
Metallography (USA), vol.16, no.3, p.299-320 (Sept. 1983).
A digital image-processing technique based on a region-growing algorithm for cavity recognition was applied to micrographs of irradiation-induced voids and grain boundary cavities. As long as the resolution of the digitizing process was adequate, cavities were detected with at least an 80% efficiency for applications where illumination, low contrast, diffuse boundaries, and cavity internal structure made conventional analysis difficult. The accuracy of both manual and computer-based size measurements depended on how well boundaries could be defined. Although more work is needed to ensure reliable measurements for the range of conditions expected in materials characterization studies, this technique looks promising as the basis of an automated system for cavity analysis. (7 refs.)

120539 Chemoabrasive polishing of MCT wafers [$Hg_{1-x}Cd_xTe$]. M.Goldstein, A.Horowitz, J.Makovsky (Nuclear Res. Centre, Negev, Beer-Sheva, Israel).
Metallography (USA), vol.16, no.3, p.321-6 (Sept. 1983).
Reports on a chemoabrasive polishing method in which a layer of damaged crystal surface is removed by the simultaneous action of abrasive agents and chemical etching. The quality of the surfaces produced by this method was evaluated and compared to that of surfaces obtained by the accepted lapping-polishing-etching procedure. (5 refs.)

120540 Equilibrium conditions for the average stresses measured by X-rays. I.C.Noyan (Technol. Inst., Northwestern Univ., Evanston, IL, USA).
Metall. Trans. A (USA), vol.14A, no.9, p.1907-14 (Sept. 1983).
True macro-stresses are measured with X-rays after material processing, only if there is a uniform plastic deformation in the sampled volume that is different from that in the rest of the material. In this stress-field the components in the direction of the surface normal are usually negligible over the depth penetrated by X-rays (for example peening). However, pseudo-macrostresses, or backstresses, arise when this condition is violated, for example if there are second phase particles and there is a gradient of plastic deformation from particle to matrix. This pseudo-macrostress field is three-dimensional, and the stresses in the direction of the surface normal can be measured with X-rays. Equations are presented which allow estimates to be made of the magnitudes of the two kinds of stress fields. (25 refs.)

120541 Some informational aspects of the experimental determination of the viscoelastic characteristics of polymeric materials. K.V.Isaev (Sci.-Res. Inst. of Mech. & Appl. Math., Rostov State Univ., Rostov, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.648-52 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.977-82 (Nov.-Dec. 1982). [received: Sept. 1983]
It is concluded that when determining the viscoelastic characteristics of polymeric materials, a mismatch in the experimental data of the model used in their analysis, which appears in particular in indeterminacy of estimates of the model parameters, leads to weak extrapolation possibilities of the latter. One of the methods of increasing the effectiveness of experiments consists of optimization of the test loading (deforming) law of the sample according to informational criteria which take into account in the general case the class of loading (deforming) processes of the material to which the experimental data are being extended. In a broader plan the informational criteria permit tying the experimental problem to definite classes of boundary-value problems and thereby posing problems for purposeful experimental investigation. (12 refs.)

120542 New strain standards for glassware stress photoelastic evaluation. T.Kishii (Res. & Dev. Center, Toshiba Corp., Kawasaki, Japan).
Opt. & Laser Technol. (GB), vol.15, no.5, p.253-6 (Oct. 1983).
Strain viewers are used for residual strain evaluation and assessment of glassware. Most viewers are the crossed-nicol type photoelastic apparatus with tint plates, in which the tint colour in the field of view changes with the insertion of strained glassware. Strain standards, which give known or predetermined optical path differences, are necessary for qualitative evaluation of residual internal stress in glassware. Two types of new strain standards, namely rotary-plate type and film-array type, are proposed and presented in detail. (1 ref.)

120543 Revealing structure of thermally sprayed WC-Co 88/12 and NiCrBSi coatings for wear resistance. E.Herrmann (Hoechst AG, Werkstofftech., Frankfurt/Main, Germany).
Prakt. Metallogr. (Germany), vol.20, no.8, p.371-87 (Aug. 1983). In English, German.
Demonstrates that the complicated, multiphase structure of thermally sprayed coatings sometimes requires as a standard procedure the involved contrasting method as well as electron-optical investigations and microanalysis for satisfactory metallographic appraisal. Further detailed investigators in this field are certainly needed to increase our understanding of the relationships between the structure and properties of these coatings and to enable their production and application to be maximized. (6 refs.)

120544 Trials using a SiO_2 dispersion as the polishing agent for metallographic polishing. H.Opielka (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).
Prakt. Metallogr. (Germany), vol.20, no.8, p.388-93 (Aug. 1983). In English, German.
Investigates whether SiO_2 is suitable as a polishing agent for metallographic specimens. Since sufficiently good methods of preparation are known for specimens with average and high hardness only soft and tough materials were selected, together with those that contain a soft phase. Very good results were obtained. These are demonstrated by micrographs. (no refs.)

120545 Magnetic structure analysis. M.N.Mikheev (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.1-8 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.3-12 (Jan. 1983). [received: Oct. 1983]
A review is given of magnetic methods of nondestructive testing of the quality of annealing, hardening, and tempering of steel parts and of the thickness of surface hardened layers in parts developed at the Institute of Metal Physics of the Ural Scientific Center of the Academy of Sciences of the USSR and the equipment used for such inspection is also illustrated. (22 refs.)

120546 Magnetic state of a test specimen demagnetized by an attached horseshoe-shaped electromagnet along the return curve. L.A.Fridman, V.P.Tabachnik, G.S.Chernova (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.8-14 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.12-19 (Jan. 1983). [received: Oct. 1983]
The results of an investigation of the residual magnetic flux and the drop in magnetic potential in the tested part of an article after switching off the demagnetizing current are presented. The calculated data are compared with experimental results. (5 refs.)

120547 A three-coordinate pulsed magnetic analyzer. M.A.Mel'gui, E.A.Shidlovskaya (Inst. of Appl. Phys., Acad. of Sci., Belorussian SSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.14-18 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.19-24 (Jan. 1983). [received: Oct. 1983]
A three-coordinate pulsed magnetic analyzer of the TPMA type designed for the inspection of the mechanical properties of ferromagnetic components, taking into account the anisotropy of structure and form, is described. The results of laboratory tests with the device are presented. (9 refs.)

120548 Ferroprobe flaw detection in alternating magnetic fields with sonic frequency. A.I.Pashagin, V.E.Shcherbinin, G.G.Glinskikh, M.K.Balabanova (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.25-8 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.31-5 (Jan. 1983). [received: Oct. 1983]
Special features of the magnetic ferroprobe method of inspection in magnetizing components with alternating fields with a frequency of up to 10 kHz are examined. Problems associated with the selection of the optimum frequency of the magnetizing field for inspection of components are investigated. The design of a flaw detector for examining the presence of discontinuities on the surface of cylindrical components is described. The results of tests carried out with the detector on hot-rolled rods of ShKh15 steel are presented. (7 refs.)

120549 An electromagnetic structurescope based on the Barkhausen effect. V.N.Moskvin, A.I.Leshchenko (Novosibirsk Electrical Engng. Inst., Novosibirsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.29-33 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.35-40 (Jan. 1983). [received: Oct. 1983]
An electromagnetic structurescope, the operation of which is based on the Barkhausen effect, is described. Its functional circuit is presented and the basic units are discussed. (8 refs.)

120550 Finite-element model of two-dimensional problems involving moving objects of inspection. I.G.Leshchenko, G.E.Lustenberg, D.V.Milyaev (S.M. Kirov Tomsk Polytech. Inst., Tomsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.33-40 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.41-9 (Jan. 1983). [received: Oct. 1983]
Two-dimensional electromagnetic inspection problems involving parts moving relative to a linear laid-on or a straight-through transducer are considered. An energy functional corresponding to the boundary-value problem in question has been found. The element model necessary for writing a complete system of linear algebraic equations with complex coefficients is obtained as a result of finite-element minimization of the functional. The unknown vector potential values at the nodes of a grid consisting of triangular cells are determined in order to solve this system. (14 refs.)

120551 Microwave eddy-current transducers for monitoring metals. V.D.Ostapenko, N.P.Kalinin (M.I. Kalinin Perm Carburetor Factory, Perm, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.40-4 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.49-53 (Jan. 1983). [received: Oct. 1983]
The general problems involved in constructing microwave transducers, which have not previously been used for flaw detection in metals using the eddy-current method, are considered. New technical solutions employed in practical microwave pickup circuits are described. The input channel of a microwave pickup as the main component which distinguishes it from ordinary high-frequency pickups is considered in detail. The possibility of constructing the proposed transducers in the form of microcircuits based on elements with lumped parameters is pointed out. (3 refs.)

120552 Selecting the control reflectors for flaw detection in welded joints. V.F.Dianov (Krasnyi Kotel'shchik Industrial Union, Taganrog, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.45-9 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.54-9 (Jan. 1983). [received: Oct. 1983]
Equations are derived, and nomograms are plotted for determining the dimensions of cylindrical broadside and corner reflectors equivalent to flat-bottom and flat corner reflectors (notches) of given dimensions. A procedure is proposed for determining the equivalent diameter of an extended flaw in a welded joint. The influence of the length of flaws on their detectability in ultrasonic weld inspection is estimated. (11 refs.)

120553 Analysis of the errors of location of acoustic-emission sources for one-dimensional objects. B.Ya.Maslov, A.M.Vasil'ev.
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.49-53 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.59-64 (Jan. 1983). [received: Oct. 1983]
The errors associated with noncorrespondence between the true and calculated values of the propagation velocity of acoustic-emission waves recorded by the receiving channels and with the error of measurement of the differences in the arrival times of the waves at the receiving transducers for various numbers and placements of the latter are considered. Error graphs are given. (2 refs.)

120554 Acoustic emission during short-term creep of fiberglass plastics. A.Yu.Detkov, N.A.Glukhov (All-Union Sci.-Res. Inst. of Nondestructive Testing, Kishinev, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.54-7 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.64-8 (Jan. 1983). [received: Oct. 1983]
Results are presented from studies to determine the effect of a steadily applied load on the fault-rate processes of fiberglass plastics as registered by acoustic-emission apparatus. It is shown that the material 'remembers' the previous loading history. (3 refs.)

120555 Signal-to-noise ratio at the output of a flaw detector with a mosaic semiconductor hard X-ray detector and digital signal processing. N.Yu.Gerasenov, I.M.Rubinovich (Electronic Flaw-Detection Res. Inst., Tomsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.58-64 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.69-77 (Jan. 1983). [received: Oct. 1983]
Expressions are derived for the signal, the background, and the noise at a silicon detector concerned with steel components and X-rays of maximum quantum energy 30 MeV. Estimates are made of the noise arising from fluctuations in the number of carriers multiplied in the detector and also of the generation-recombination and thermal noise. Expressions are given for the signal-to-noise ratio at the output of a flaw detector with digital data processing, which works with or without adaptation to the radiation flux. There is an advantage in a system that adapts to a static radiation flux. Relationships are given for this for the signal-to-noise ratio in relation to the quantization step for the correcting current, which enable one to relate the parameters of the digital system to those of the detector and to the monitoring sensitivity. (11 refs.)

120556 Calculation of surface-scattered optical fields in designing optical scanning devices. E.M.Salmina (Novosibirsk Electrotech. Inst., Novosibirsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.65-9 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.77-83 (Jan. 1983). [received: Oct. 1983]
A method is given for calculating the two-dimensional optical fields scattered by acceptable and defective surfaces for various working conditions in the illumination and receiving devices; this is based on the theory of wave scattering at a statistically uneven surface (tangential-plane method) with piecewise-linear defect relief description. A comparison is made of theoretical and experimental results and an estimate is made of the calculation error. The method can be used in optimizing the optical systems of scanning flaw detectors. (4 refs.)

120557 Analytic properties of the reflection coefficient for a layered dielectric structure in wide-band UHF flaw detection. A.M.Akhmetshin (Dnepropetrovsk Univ., Dnepropetrovsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.70-7 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.83-93 (Jan. 1983). [received: Oct. 1983]
Recovery of the phase response for the reflection coefficient is considered on the basis of measurement of the modulus over a wide frequency range in the monitoring of one-layer and two-layer insulating structures. Results from numerical simulation and an actual test are considered. (9 refs.)

120558 A tracking device for stabilizing the pressure of a transducer on a workpiece during scanning. V.S.Gromov (Leningrad Engng. Construction Inst., Leningrad, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.1, p.77-9 (Jan. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.1, p.93-6 (Jan. 1983). [received: Oct. 1983]
The design of mechanical scanning systems is particularly important in the use of nondestructive test methods, particularly with application to objects of various shapes. The effector mechanism is very important, since this carries the detector, and its functions include stabilizing the pressure on the workpiece. The tracking carrier with a two-arm lever is a simple and reliable device meeting the major requirements of the monitoring: stabilizing the pressure on the surface and constant distance from the surface to the transducer. The carrier can be used as an additional device in a scanner for bodies of rotation for surfaces of various shapes. When the body is a cylinder or cone, the effector mechanism in tracking device will describe a path similar to that of the generator corresponding to the object. This design of carrier mechanism has been used in an apparatus for testing spherical shells and has been introduced at Lensovet Technological Institute in Leningrad. The scanning mechanism of this design performs a motion in the meridional plane of a sphere and provides the necessary technological parameters. This upgraded apparatus eliminates manual work from the monitoring operations for spherical shells, which greatly improves labor productivity and the performance in monitoring these shells. (7 refs.)

120559 Relation between the actual and nominal boundaries of an extended defect in ultrasonic examination of a thick sheet. A.S.Golubev, S.K.Pavros, S.V.Mamistov (Ul'yanov Leningrad Electrotech. Inst., Leningrad, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.81-4 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.3-7 (Feb. 1983). [received: Oct. 1983]
There is a relationship between the position of the edge of an opaque half plane and the amplitudes of the shadow and echo signals, which is dependent on the wave parameters of the acoustic system and the monitoring sensitivity. (7 refs.)

120560 Attenuation of ultrasound in steels with a homogeneous structure. V.L.Busov (Sci.-Res. & Design Technol. Inst. of Engng., Kramatorsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.87-93 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.11-18 (Feb. 1983). [received: Oct. 1983]
The total scattering cross section and the effective backscattering cross section at volume heterogeneities of an arbitrary scale are determined theoretically for carbon and low-alloy steels with an attenuation factor of ultrasonic waves of 1-10 dB/m. The scale of the volume heterogeneities of the propagation velocity of ultrasound is evaluated. The results are compared with the results obtained on the basis of the existing attenuation theories. (9 refs.)

120561 Measuring procedure for the physical and mechanical characteristics of thin rods and wires using the ultrasonic resonance method. V.G.Meierson.
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.93-9 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.19-26 (Feb. 1983). [received: Oct. 1983]
Based on an improved theory for the flexural vibrations of a rod, a procedure has been developed that makes it possible to determine the characteristics of a rod when its length and the tensile force on it are given, namely, the transverse dimensions, the flexural rigidity and the radius of the moment of inertia of the cross-sectional area, the mass and density of the material, Young's modulus, the shear modulus, Poisson's ratio, and the transverse and longitudinal strains of the object under tension. Generalized experimental criteria are established for the correspondence between the properties of a rod and its model. Consideration is given to the effect of compensating for the influence of inertia on the flexural vibrations of the rod, and to the possibility of utilizing this effect for checking the rods. The results of experimental studies are presented. (8 refs.)

120562 Location information of acoustic-emission signals. O.I.Khol'kin.
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.105-11 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.32-40 (Feb. 1983). [received: Oct. 1983]
Based on an examination of amplitude-spatial diagrams for sources of acoustic-emission signals it is shown that when the receiving points are spaced too widely, there will be dead zones not only for the location but also the detection of useful signals. Formulas are derived for calculating the maximal permissible distances between receiving points for the inspection of one-dimensional and two-dimensional objects. Relationships are given for finding the probabilities of occurrence of undetectable acoustic-emission signals, of those that give no location information, and those that do when sites of the radiation points are fixed and random. (6 refs.)

120563 Special features of the ultrasonic inspection of purity of aluminum A9999. L.A.Yakovlev, E.K.Guseva, Yu.I.Belyakov, M.L.Khavkin (V.I. Ul'yanov Electrotech. Inst., Leningrad, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.111-12 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.40-1 (Feb. 1983). [received: Oct. 1983]
Examines the possibilities of the ultrasonic method with resonance measurements in the kilohertz frequency range. As indicated by the dislocation theory of internal friction, the selected frequencies should result in the maximum sensitivity. (5 refs.)

120564 Detectability of defects in inspection with ultrasonic inclined transducers made of organic glass and caprolon. B.S.Svyat-skii, M.I.Apakhov, L.A.Tryapkina.
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.113-14 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.41-2 (Feb. 1983). [received: Oct. 1983]
Comparative investigations of the detectability of defects were carried out on a 30-mm-thick plane-parallel steel specimen. The reflector was irradiated many times (20 times) with the direct beam at various sensitivity levels using standard transducers with the prism made of organic glass and caprolon. The working frequency of the transducers was 2.5 MHz; the prism angle was 40°. The model of the defect was represented by a vertical drilled hole 1.5 mm in

diameter and 5 mm long. The number of detections of the reference reflector was recorded in inspection at various sensitivity levels above the reference level. In inspection with the transducer made of organic glass at the reference inspection level, the signal from the reflector was obtained in 20% of cases. To ensure 100% detection of the reflector, the sensitivity would have to be increased to 4 dB. In irradiation with the caprolon transducer at the reference sensitivity level, the detectability is equal to only 10% and the required increase of sensitivity for scanning should not be lower than 9 dB. (2 refs.)

120565 Mechanism of visualization of inclusions in dielectrics using the gas discharge. V.N.Balakshin, A.M.Tivkov, V.I.Fel'dman.
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.115-18 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.43-6 (Feb. 1983). [received: Oct. 1983]
The possible mechanism of visualization of heterogeneities in dielectric materials using the gas discharge is examined. The possibilities of visualization of inclusions in the dielectrics are linked with the distortion of the electrostatic field in the dielectric in the presence of an inclusion and by the effect of this distortion on the secondary emission characteristics dependent on the field. It is assumed that the 'image' is formed by the secondary electrons as a result of secondary ion-electron emission (SIEE). Fields are calculated for a planar geometry approximated to the conditions of visualization in the gas discharge for various parameters of the inclusion of its position in the dielectric. On the basis of the calculation results, it may be concluded that the proposed mechanism is in qualitative agreement with the experimental data. (8 refs.)

120566 Visualization of fatigue defects by an electrodischarge high-frequency method. S.V.Dezhkunova, A.G.Dovgyallo (Inst. of Appl Phys., Acad. of Sci., Belorussian SSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.118-21 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.46-50 (Feb. 1983). [received: Oct. 1983]
The detectability of fatigue defects in components made of D16 alloy and also in full-size specimens of steel 45, titanium VT-1, and D16 alloy by an electrodischarge high-frequency method was examined. It is shown that the method makes it possible to detect point corrosion and also cracks hidden below paint and varnish coatings. (4 refs.)

120567 Radiowave inspection of the properties of dielectrics. E.F.Kondrat'ev, A.V.Pets, B.V.Karasev (Kaliningrad State Univ., Kaliningrad, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.121-3 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.50-1 (Feb. 1983). [received: Oct. 1983]
UHF radiowave methods can be used for checking and measuring many properties of dielectrics connected with the magnitude of the real and the imaginary part of dielectric permeability: humidity; chemical composition, structural state, dimensions, etc. The authors describe one of the simplest methods the one based on measuring the characteristics of a standing electromagnetic wave in a measuring line loaded onto a cell filled with the investigated material. The probe of the measuring line is placed at the points of maximum and minimum of the standing wave, and then the modulus Γ and the phase ϕ of the reflection coefficient are determined, the results being compared with the previously plotted calibration curves of the functions $\Gamma(W)$ and $\phi(W)$, where W is a magnitude characterizing the property to be inspected. In automatic inspection the electric signal from the detector is transmitted to the system for correction of the phase shift which retunes the line in such a way that the probe is located constantly at the maximum of the standing wave. (1 ref.)

120568 Improving the accuracy of magnetic inspection of the mechanical properties of high-quality steel. L.D.Devyatchenko, L.E.Valyaeva (G.I. Nosov Magnitogorsk Mining & Metall. Inst., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.124-8 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.52-7 (Feb. 1983). [received: Oct. 1983]
Examines ways of improving the mathematical model of the inspection of the mechanical properties of high-quality carbon steel using a magnetic-pulse analyzer IMA-2A, a ferrosonde coercimeter KIFM-1M, and a contact hardness tester TK-1M. It was established that inclusion of technological production factors of the steel, and of its chemical composition in the model considerably improves the quality of the approximation in nondestructive magnetic inspection of metal production. (4 refs.)

120569 Possibilities of utilizing the Hall effect in the magnetic structural analysis of heat-treated steels. E.S.Gorkunov, B.M.Lapidus, G.Ya.Batinova (Inst. of Metals., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.137-41 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.66-71 (Feb. 1983). [received: Oct. 1983]
Structural steels 30KhGSA, 34KhN3M, 40Kh, SP-28, and alloy steel 3Kh13 were used to examine the relationships governing the variation of the Hall EMF in various tempering conditions, and to show the possibilities of using this characteristic of the magnetic structural analysis of heat-treated steels. (12 refs.)

120570 Examination of the magnetic, electrical, and mechanical properties of thermoelectrode materials based on nickel. G.V.Bida, R.A.Vafin (Inst. of Metals Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.141-4 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.71-4 (Feb. 1983). [received: Oct. 1983]
It is shown that nondestructive magnetic inspection can be used to examine the service properties of thermoelectrode materials Alumel, SA, NK, and NKM. (8 refs.)

120571 Magnetic fields of surface flaws with combined magnetization of products. A.I.Pashagin, V.E.Shcherbinin, S.A.Donskoi (Inst. of Metals Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.144-50 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.75-81 (Feb. 1983). [received: Oct. 1983]
Examines the magnetic fields of flaws on the outer surface when products are magnetized simultaneously by an alternating and constant magnetic field whose vectors are parallel. The AC and constant components of the field of the flaw are measured, and it is shown that there exists an optimum region of constant magnetizing fields in which the sensitivity of the magnetic method of control by the AC compound magnetizing fields in which the sensitivity of the magnetic method of control by the AC component is maximal. The intensity of the constant magnetic field at which the AC component of the field of the flaw is maximal depends on the ratio of the amplitudes of the alternating and constant field, and also on the dimensions of the flaws. (5 refs.)

120572 Metrological provisions for magnetic and eddy-current means of nondestructive inspection. A.P.Vashchekina, L.A.Rubinshtein.
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.151-4 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.81-6 (Feb. 1983). [received: Oct. 1983]
Describes the present state and level of metrological provisions for magnetic and eddy-current means of nondestructive inspection in the USSR. It explains the basic trends of further improvement of the metrological provisions for these means, the compilation of technical standard documentation and test equipment. (2 refs.)

120573 Effect of porosity and phase composition on the magnetic properties of sintered structural steel ZhGr1D2.5K0.4. A.I.Ul'yanov, G.V.Sterkhov, V.G.Ermolaev, A.V.Zagainov (Inst. of Metals Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.155-7 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.86-8 (Feb. 1983). [received: Oct. 1983]
Present the results of investigations into the magnetic properties of sintered structural steel ZhGr1D2.5K0.4 used for the manufacture of plain bearings. Measurements were taken in a closed magnetic circuit in the complete and partial cycles of the magnetic hysteresis loop on specimens in the form of rings with an internal diameter of 32.35 mm, an external diameter of 38.75 mm, and a height of 10 mm. The winding wound on the ring made it possible to take measurements in a magnetic field of up to 300 A/cm. The hysteresis loops were recorded in a two-coordinate automatic recording device, using an F-190 microwebermeter as an integrating device. (6 refs.)

120574 Possibilities of the nondestructive magnetic inspection of hardness of 32Kh2NVMBR high-strength steel. N.N.Zatsepin, P.P.Astashenko, N.A.Potapova, V.D.Kaverin, T.M.Smirnova (Inst. of Appl. Phys., Acad. of Sci., Belorussian SSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.158-9 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.89-90 (Feb. 1983). [received: Oct. 1983]
To examine the possibilities of magnetic inspection of the mechanical properties of 32Kh2NVMBR high-strength steel, investigations were conducted into the effect of heat treatment on the magnetic properties and hardness of the steel. The magnetic properties of the steel (coercive force H_c, remanent induction of the body B_d, maximum magnetic permeability μ_{max}, saturation magnetization M_s) were measured in BU-3 ballistic equipment. The maximum magnetizing field was 40000 A/m. The specimens of the steel were heat-treated in the following conditions: oil quenching from 940°C, tempering at 150-500°C. The HRC hardness of the specimens was measured by the Rockwell method. The dependence of the magnetic properties on temperature is given. An increase of tempering temperature from 150 to 500°C reduces hardness, coercive force, and remanent induction of the body, whereas the maximum magnetic permeability increases. Saturation magnetization rapidly increases in the tempering temperature range 150-350°C, reaches the maximum value at 350°C, and then slowly decreases. (4 refs.)

120575 Automating radiometric monitoring. A.S.Chekalin, A.K.Temnik, G.E.Butakova, V.I.Goncharov (Electronic Flaw Detection Res. Inst., Tomsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.160-2 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.91-4 (Feb. 1983). [received: Oct. 1983]
Defines the basic specifications that an automatic radiometric system (ARS) must meet in monitoring components of complicated shape, and describes an existing automatic system that works in conjunction with an RD-10R multichannel γ-ray flaw detector. (4 refs.)

120576 Optimizing X-raying of steel items. V.P.Lopaev, P.M.Kravtsov (Atomkotlomash Production Cooperative, Rostov-on-Don, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.162-3 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.94-5 (Feb. 1983). [received: Oct. 1983]
It is useful to employ X-ray equipment in monitoring power-engineering items, and it is therefore of interest to examine the conditions for maximum sensitivity for continuous-spectrum sources when there is scattering in the material. Experimental studies have been made on the relative sensitivity for radioscopic systems of Introscope type, which have shown that the optimum energy agrees to ±10% with the calculated value for various steel thicknesses. The dependence of the optimum X-ray energy on the steel thickness can be utilized in constructing RS with automatic tube voltage regulation. (4 refs.)

120577 Use of FT-41 phototechnical film in X-ray examination. A.M.Sabadash, Ya.M.Ravlik, V.I.Dzhim.
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.164 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.95-6 (Feb. 1983). [received: Oct. 1983]
RT-5 film, which is a high-contrast unscrewed film of fine-grained type, is widely used in X-ray monitoring of castings and welded joints in aluminum, titanium, and magnesium alloys. However, this film is expensive on account of its high silver content, as there is emulsion on both sides. If very high resolution is required one should use single-layer films, but with an increased layer thickness. Such X-ray films are not at present commercially available, so the authors have investigated FT-41 phototechnical film for X-ray use, which has a single light-sensitive layer. The experiments indicate the limits to the use of FT-41 film for certain thicknesses. Within the specifications in the standardization documentation, FT-41 film can replace RT-5 for X-ray testing of aluminum-base alloys of thickness from 1.5 to 30 mm, magnesium ones from 4 to 50 mm, and titanium ones from 0.5 to 5 mm. (4 refs.)

120578 Dynamic fracture toughness of structural steels by instrumented charpy test. J.Namekata (Dept. of Mech. Engng., Nat. Defense Acad., Yokosuka, Japan), K.Sasaki, S.Shioya.
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.4, p.383-99 (Dec. 1982). In Japanese. [received: Sept. 1983]
The dynamic fracture toughness ($K_C{}^d$) of three kinds of structural steels (SM50, WT 60 and WT80) has been evaluated by means of instrumented charpy test in the temperature range of $-40-+95$°C. The results obtained in this study are summarized as follows: (1) $K_C{}^d$ obtained from equivalent energy method shows a clear ductile-brittle transition behaviour for SM50 and WT60, but transition behaviour for WT80 was not clearly shown; (2) the value of $K_C{}^d$ from instrumented charpy test is effective in an area of brittleness and a limited area of ductile-brittle transition—however it is extremely difficult to estimate $K_C{}^d$ of large structural steel from the result of small charpy specimen testing at comparable high temperature on account of the problems of thick effectiveness and crack-initiation site; (3) $K_C{}^d(J)$ obtained from Rice's J integration value are nearly equal to $K_C{}^d$, so both analyses can show the value of the dynamic fracture toughness; and (4) the $K_C{}^d$ transition curve depends on sharpness of the notch's tip. (18 refs.)

120579 Roller bearing fatigue tester. S.Simandiri (Ampol Res. & Dev. Lab., Wynnum, Queensland, Australia).
Trans. Inst. Eng. Aust. Mech. Eng. (Australia), vol.ME8, no.1, p.1-7 (June 1983).
A rolling fatigue tester was built and used to evaluate fatigue lives of roller bearings. It is operated using a full-scale roller bearing housed in a lubricant chamber. The bearing inner race is driven by a drive shaft and its outer race is permitted to rotate in the housing by means of free fitting such as in floating ring bearings. The roller retainer ring is kept stationary using three retainer pins which are integral parts of the housing. This design permits the rollers to roll around the races but not to orbit about the shaft. Hence, half rollers at the lower part of the bearing are continuously loaded unidirectionally, providing an accelerated test which is aimed at simulating the roller bearings in hydraulic pumps. (7 refs.)

120580 Laboratory evaluation of the on-line Ferrograph. P.W.Centers (Aero Propulsion Lab., Wright-Patterson Air Force Base, OH, USA).
Wear (Switzerland), vol.90, no.1, p.1-9 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
A laboratory evaluation of the on-line Ferrograph for fluids containing well-characterized debris indicates that the wear concentration, as measured by the instrument, is unaffected by variation in fluid pressure (0.21-0.65 MPa (absolute); 30-80 lbf in^{-2} (gauge)) and temperature (65-99°C) within the range examined, that the difference between L, the concentration of large debris particles, and S, the concentration of small debris particles, describes the severity of wear and that changes in debris concentration at or near the level of 1 ppm can be detected. Correlation of on-line and analytical ferrographic data was apparent; such correlation was not found for spectrometric oil analysis, colorimetric iron analysis or particle count data. Start-up and low fluid temperature problems encountered with the unit may be avoided by sensor insulation and preheating. Additional field evaluations are required to determine suitability for many potential applications. (10 refs.)

120581 Continuous wear measurement by on-line ferrography. W.Holzhauer, S.F.Murray (Dept. of Mech. Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
Wear (Switzerland), vol.90, no.!, p.11-19 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
An on-line Ferrograph was used to monitor the wear rates of oil-lubricated ball-bearings. Periodically, the test bearings were also removed from the test stand and cleaned and weighed on an analytical balance. A comparison of the mass loss data obtained by each of these two methods showed that the Ferrograph readings did provide on-line quantitative wear data for each individual test. However, the rates at which the ball-bearings wore were not consistent from test to test. For the four ball-bearings that were evaluated, plots of the Ferrograph concentration readings versus bearing mass loss gave slopes that varied between 1.1 and 2.5. Nevertheless, the results showed that semiquantitative data on the wear rates of machine components could be obtained with this on-line instrumentation. (2 refs.)

120582 The deleterious effect arising from preparation of ferrograms in ferrography and the consequences in subsequent analysis of wear particulates. D.G.Jones (Ruthana-Tribo-Tech. Ltd., Swansea, Wales), O.K.Kwon, D.A.Vaughan.
Wear (Switzerland), vol.90, no.1, p.63-73 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
The resolution of problems arising from the existing ferrography machine in the ferrographic deposition of wear particles is considered as a relevant prerequisite for the qualitative and quantitative analysis relating to the correct interpretation of the wear behaviour in lubricated systems. Crushing, shattering and polishing actions of wear particles generated from a lubricating system were confirmed to have occurred during preparation of Ferrograms when the existing ferrography machine was used because of the squeezing action of the peristaltic pump. Some polymer-like material, e.g. trichites, tubules and glassy flake materials, were entrapped inside the polytetrafluoroethylene (PTFE) tube where the PTFE tube was compressed by the pump. Severe cutting abrasive wear occurred on the inside wall of the PTFE tube as the wear particles passed through. The greater the tube diameter or wall thickness, the more the wear particles were reduced in size. The polishing action on the particles which accompanied this activity was also confirmed. (6 refs.)

120583 Wear studies through particle size distribution. II. Multiple field analysis in ferrography. B.J.Roylance, D.A.Vaughan (Dept. of Mech. Engng., Univ. College of Swansea, Swansea, Wales).
Wear (Switzerland), vol.90, no.1, p.137-47 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
For pt.I see ibid., vol.90, no.1, p.113-36 (1983). Further developments in techniques used to analyse wear particle size distributions are described. Cumulative counting of particles from different positions along the Ferrogram slide permits the use of an appropriate significance test to determine the transition from one mode of wear to another. (4 refs.)

120584 The singularity expansion method as applied to the elastodynamic scattering problem. G.Bollig, K.J.Langenberg (Fraunhofer-Inst. fur Zerstorungsfreie Prufverfahren, Univ. des Saarlandes, Saarbrucken, Germany).
Wave Motion (Netherlands), vol.5, no.4, p.331-54 (Aug. 1983).
A basic problem in nondestructive testing of materials is the classification of defects with respect to size and geometry. Utilizing elastodynamic scattering, ultrasonic test methods reduce this problem either to the application of reconstruction algorithms or to the parametrization of experimental data in terms of quantities being related to the physical scattering mechanisms. The so-called Singularity Expansion Method (SEM) proves essentially useful to predict and understand impulsive scattering of ultrasound; in addition, even though not yet fully solved in practice, it seems possible to parametrize experimentally obtained time records in a sense which is physically intuitive. Several theoretically derived singularity patterns are presented for various body shapes and material compositions, which yield a thorough and physically intuitive interpretation in terms of distinct creeping wave modes. They are compared with experimental results for a spherical void in a steel test specimen. (51 refs.)

120585 Light-microscopical analysis of nitrided or nitrocarburized iron and steels. P.F.Colijn, E.J.Mittemeijer, H.C.F.Rozendaal (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands).
Z. Metallkd. (Germany), vol.74, no.9, p.620-7 (Sept. 1983).
Methods for the light-microscopical analysis of compound layers and diffusion zones of nitrided or nitrocarburized iron and steels are presented. Applied variants comprise Nital, Murakami and interference etching in combination with bright-field, polarized-light or phase-contrast microscopy. Quantitative confirmation of qualitative results from light microscopical analysis is provided by electron-microprobe and X-ray diffraction analyses. (19 refs.)

120586 Eddy current measuring devices for automatic detection of material defects in strands during the casting process. B.Christmann, J.Weber (AEG Telefunken, Berlin, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.419-25 vol.1
Problems encountered in the detection of material cracks on glowing slab strands during continuous casting of steel due to the adverse conditions such as high temperature and scaling are outlined. Eddy current sensors were developed for determination of surface cracks. Tests carried out with models as well as those carried out in continuous casting plants were successful. (4 refs.)

120587 Testing and quality control of materials by microstructure analysis. M.Hajnal (Dept. of Process Control, Tech. Univ. of Budapest, Budapest, Hungary), M.Konyves-Toth, T.Reti.
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.283-92 vol.3
Automatic control of quality in production and research is dealt with. A combined approach based on both geometrical-topological and statistical features of the micrographs is presented whose main aim is to perform their analysis and classification. As application example, recognition of the distribution of graphite flakes in gray cast iron, is given to show that the method developed is suitable for testing and automatic classification of materials. (11 refs.)

120588 Advances in surface inspection using on-line image processing. T.J.Ellis, W.J.Hill, L.Finkelstein (Dept. of Phys., City Univ. of London, London, England).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.409-18 vol.3
Automatic optical surface inspection of plain flat surfaces is dealt with. Sophisticated information processing is required for this inspection task, and a system has been developed and evaluated for cold-rolled steel strip via extensive studies in computer simulation, using interactive colour graphics terminals. The system incorporates a laser scanner with multiple sensors of the scattered light field from the surface. Surface defect signals are detected on each signal channel with a bank of matched filters, and then subjected to a hierarchy of processing operations for delineation (i.e. boundary extraction), parameterisation, and identification of the defect type. The techniques of image processing and automatic pattern recognition are employed. (4 refs.)

120589 Ultrasonic fractography of glassy polymers. K.Takahashi, K.Matsushige, Y.Sakurada (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.34/1-6
A comparison is made concerning the fracture velocity values for PMMA and epoxy simultaneously obtained by the method based on ultrasonic fractography and by high speed photography. A satisfactory agreement is obtained, which confirms applicability of ultrasonic fractography to viscoelastic materials. Some application examples are shown, related to fracture velocity measurements at an initial stage of fast crack propagation and crack arrest. (9 refs.)

120590 Residual stresses in plastics pipes. J.M.Hodgkinson, J.G.Williams (Dept. of Mech. Engng., Imperial Coll., London, England).
Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers, Cambridge, England, 29 March-1 April 1982 (London, England: Plastics & Rubber Inst. 1982), p.35/1-7
The determination of residual stresses in six samples of plastics pipe is described using a layer removal method and measuring either deflection on slitting or the opening bending moment. These results are compared with a thin ring method and it is concluded that the layer method using the moment and outside machining is the best. The ratios of the measured stresses indicate that the sizing die is the controlling factor in cooling and the stress magnitudes are strongly influenced by the cooling temperature. (3 refs.)

120591 Enhancement of the mechanical adhesion between the surface of fillers and plasticized PVC matrix. W.Dahlig (Politech. Warszawska, Warsaw, Poland), W.Janczak.
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.120-2 (April 1983). In Polish. [received: Oct. 1983]
To enhance the mechanical adhesion during preparation of PVC compounds, polymer solutions of various concentration in a plasticizer have been used, these solutions being mixed with fillers. It has been found that the application of a polymer solution of appropriate concentration lowers the frictional drag of plasticizing, improves the mechanical properties and lowers the plasticizer extraction. 82.30 SPECIFIC CHEMICAL REACTIONS; REACTION MECHANISMS

120592 Catalyzed and inhibited decomposition of ammonium perchlorate. R.P.Rastogi, A.P.Rao, V.Syal (Gorakhpur Univ., Gorakhpur, India).
AIAA J. (USA), vol.21, no.9, p.1351-2 (Sept. 1983).
There has been active interest in recent years in the study of thermal decomposition of ammonium perchlorate (AP) in the presence of catalysts and inhibitors because of its importance in solid-propellant rockets. Some recent studies have shown that for composite propellants at atmospheric pressure carbonates are more effective burning rate catalysts than oxides of chromium and copper and that calcium oxide and carbonates of calcium, barium, and strontium act as burning rate inhibitors. From the viewpoint of rocket technology, it is desirable to investigate how these catalysts and inhibitors influence the thermal decomposition of AP. This is particularly important in view of the recent finding that the data on AP decomposition for different temperature ranges and for different particle sizes can be represented by the general equation $d\alpha/dt = a\alpha - b\alpha^2/1 + d\alpha$, where a, b and d are constants. α is the fraction decomposed at time t. The authors make a comparative study of catalysts and inhibitors in order to investigate how they affect the values of a, b, and d. (23 refs.)

120593 A theoretical analysis of the relative roles of ground and excited states in the bond rupture and hydrogen migration pathways in ethyl and vinyl radicals. A.Sevin, H.T.Yu (Lab de Chimie Organique Theorique, Paris, France), E.M.Evleth.
THEOCHEM (Netherlands), vol.13, no.1-2, p.163-78 (Sept. 1983).
Ab initio SCF+CI calculations of the potential energy surfaces for bond rupture and hydrogen-migration pathways are presented for the ground and excited states of ethyl and vinyl radicals. For the ground state surfaces various methodological problems are discussed with regard to the use of single configuration RHF and UHF open-shell techniques. The relationship between the ground and excited state surfaces is clearly delineated using orbital and state correlation diagrams. The essentials of these qualitative diagrams are reproduced at the computational level. The main feature of the excited state migration pathway is that there exists a direct C_{2V} adiabatic pathway taking the excited states of ethyl and vinyl radicals to the ground states of ethylene and acetylene+H, respectively. However, only in the case of the vinyl radical is this pathway energetically feasible. In the case of the vinyl radical, the presence of low lying excited states and subsequent high barriers indicates that excited vinyl radicals should be stable. However, the excited states of ethyl and other related alkyl radicals should be directly photodissociative or predissociative. (49 refs.)

120594 The rate of the reactions of C_2O radicals with H and H_2. O.Horie, W.Bauer, R.Meuser, V.H.Schmidt, K.H.Becker (Phys. Chem., Bergische Univ. Gesamthochschule Wuppertal, Wuppertal, Germany).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.251-4 (9 Sept. 1983).
The rate constants for the reactions $C_2O+H \rightarrow$ products (1) and $C_2O+H_2 \rightarrow$ products (2) have been determined at room temperature by means of laser-induced fluorescence detection of C_2O radicals, generated either by the KrF excimer laser photolysis of C_3O_2, or by the reaction of C_3O_2 with O atoms. Values of $k_1=(3.7\pm1.0)\times10^{-11}$ cm^3 s^{-1} and $k_2=(7\pm3)\times10^{-13}$ cm^3 s^{-1} were obtained. (14 refs.)

120595 The effect of a magnetic field on the product yield of a geminate radical-pair reaction in homogeneous solution. H.Fischer (Phys. Chem. Inst., Univ. Zurich, Zurich, Switzerland).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.255-8 (9 Sept. 1983).
The yield of pivalaldehyde, a cage product of the photolysis of di-tert-butyl ketone, has been studied in *n*-decane at 68°C as a function of the external magnetic-field strength, $0 \leq B \leq 9000$ G. A small increase at low field and a substantial decrease at higher fields are explained quantitatively in terms of the radical-pair theory, employing known magnetic and diffusion parameters of the geminate pivaloyl/tert-butyl radical pair. Non-geminate reaction products do not show magnetic-field dependent yields. (27 refs.)

120596 Charge transfer in polar media. Transition-state entropy. Y.I.Dakhnovskii, A.A.Ovchinnikov (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.17-27 (Oct. 1983).
The theory of charge (electron, proton and other ions) transfer chemical reactions in polar media is considered. Within the semiclassical approximation the transition-state entropy is derived for an arbitrarily large term splitting. The dependence of entropy on dielectric medium properties and the heat of reaction is obtained. It is pointed out that the dependence of the transition probability on the heat of the reaction results in a compensation effect. In the limiting case of the exchange integral β being small ($\beta \ll k_B T$) an expression for the activated-complex entropy is derived in agreement with that found in the literature. The validity condition of this approximation is given. Water is chosen as a typical example of a polar medium; the pre-exponent is estimated to be larger by a factor of 10^3 than the one in the Einstein model of a medium vibronic spectrum. The activation energy of the charge transfer is shown to be less than Marcus'. (16 refs.)

120597 New I_2 emission from iodine atom recombination reaction. K.-H.Stephan-Rossbach, F.J.Comes (Inst. fur Phys. und Theoretische Chem., Frankfurt/Main, Germany).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.121-8 (Oct. 1983).
In the UV photolysis of perfluorinated alkyl iodides, iodine atoms in the two spin states $^2P_{1/2}$ and $^2P_{3/2}$ of the electronic ground state are formed. The atoms recombine in a three-body collision to form iodine molecules. The reactive collision of $I(^2P_{3/2})$ with $I(^2P_{1/2})$ leads to $I_2(B)$ which is detected by its chemiluminescence spectrum. The observed spectra contain an additional emission which is discussed to be the result of a transition from a higher excited I_2 state correlating with two $I(^2P_{1/2})$. (26 refs.)

120598 Comment on 'scaling relationships in photoelectron-photoion coincidence studies: the acetone dissociation'. D.J.McAdoo (Marine Biomedical Inst., Univ. of Texas Medical Branch, Galveston, TX, USA).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.203 (Oct. 1983).
Johnson et al. (see ibid., vol.63, p.1, 1981) recently contradicted the conclusion of earlier workers that the acetone ion formed by rearrangement from its enol isomer decomposes without prior equilibration of its internal energy. Johnson et al. proposed that some of the enol ions decomposed to $CH_2=C=OH^+$ rather than $CH_3C\equiv O^+$ to explain inflection points in the kinetic energy release distributions (KERDs). The author comments on this rearrangement. (8 refs.)

120599 Determination of rate constants for some reactions of CBr radicals by VUV laser flash photolysis. L.Hellner, K.T.V.Grattan, M.H.R.Hutchinson (Blackett Lab., Imperial Coll., London, England).
Chem. Phys. (Netherlands), vol.80, no.3, p.345-50 (15 Oct. 1983).
The CBr radical has been produced by VUV laser flash photolysis of $CHBr_3$ and absolute rate constants for reactions with O_2, CO_2 and N_2 have been measured. The possible mechanisms of these reactions have been discussed. (20 refs.)

120600 Reaction rates of D_2+T_2 mixtures at 295K. G.T.McConville, D.A.Menke, R.E.Ellefson (Monsanto Res. Corp., Miamisburg, OH, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1441-6 (1983).
Reaction rates for the production of DT from D_2+T_2 mixtures are reported as a function of pressure, initial T_2 concentration, and concentration of the impurity of CT_4. The reactions took place in a specially constructed stainless steel container. The reactions are reproducible and can be explained in terms of the ion-molecule chain model of Thompson and Schaeffer (1958). The presence of T_2O as an impurity has no measurable effect at the measured concentration. (16 refs.)

120601 Thermal stability of molybdenum diiodide. L.A.Klinkova (Inst. of Solid-State Phys., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1631-4 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1896-9 (Nov. 1982).
It was shown that molybdenum diiodide does not disproportionate with formation of higher iodides when heated in a vacuum, as is the case with other molybdenum halides. Solid molybdenum diiodide becomes depleted in iodine within the limits of the homogeneity range of $MoI_{2-x}(x \leq 0.08)$ when heated to 1000K in a static vacuum, and dissociated into molybdenum above 1000K. Molybdenum begins to evaporate in a static vacuum above 870K and is stable in the gaseous form in the Mo-I system up to 1080K; the gaseous iodide subsequently begins to dissociate into molybdenum. In as atmosphere of iodine, solid MoI_2 is stable up to 1270K, with gaseous MoI_2 is stable up to 1370K. (8 refs.)

120602 Thermal stability of molybdenum triiodide. L.A.Klinkova (Inst. of Solid-State Phys., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1635-9 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1900-3 (Nov. 1982).
It was found that the composition of molybdenum triiodide corresponds to $MoI_{3-2.88}$ upon heating to 691K in a vacuum; above 691K, MoI_3 decomposes into molybdenum diiodide. In an atmosphere of iodine, the solid triiodide is stable up to higher temperatures. (6 refs.)

120603 Mass-spectrometric study of the behavior of molybdenum di- and triiodide during heating to 743K. L.A.Klinkova, G.G.Sikharulidze, A.E.Lezhnev (Inst. of Solid-State Phys., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1647-8 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1911-13 (Nov. 1982).
The composition of the products of molybdenum di- and triiodide decomposition upon heating to 743K has been studied by mass-spectroscopy. (5 refs.)

120604 Structure and reactivity of gas-phase ions: $C_4H_4^{+\cdot}$. W.Wagner-Redeker, A.J.Illies, P.R.Kemper, M.T.Bowers (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5719-24 (7 Sept. 1983).
The structure and reactivity of $C_4H_4^{+\cdot}$ ions in the gas phase have been investigated with use of collision-induced dissociation (CID) and tandem ion cyclotron resonance spectroscopy. Two stable isomers were identified, one linear $C_4H_4^{+\cdot}$ and one cyclic $C_4H_4^{+\cdot}$, in agreement with observations of Ausloos (1981). The m/z 26/27 ratio in the CID pattern of $C_4H_4^{+\cdot}$ is strongly dependent on the isomeric content of the $C_4H_4^{+\cdot}$ beam. This ratio was calibrated against isomeric composition, and the percent cyclic and linear $C_4H_4^{+\cdot}$ arising from a variety of sources was explored. The ion chemistry of $C_4H_4^{+\cdot}$ with C_2H_2 was examined in the tandem ICR. The linear form reacted with a rate constant of $\sim(3\pm1.5)\times10^{-10}$ cm^3/s, while the cyclic form reacted extremely slowly if at all. Acetylene 'catalyzes' isomerization of linear $C_4H_4^{+\cdot}$ to cyclic $C_4H_4^{+\cdot}$ with a rate constant of $\sim1\times10^{-10}$ cm^3/s, presumably via a long-lived $C_6H_6^{+\cdot}$ intermediate. (28 refs.)

120605 Syntheses and structures of the $[Fe^{III}(SPh)_4]^-$ and $[Fe^{III}(SEt)_4]^-$ anions. A general route to iron(III) tetrathiolate complexes. S.A.Koch, L.E.Maelia (Dept of Chem., State Univ. of New York, Stony Brook, NY, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5944-5 (7 Sept. 1983).
The authors' recent success using the sterically hindered thiolate ligand 2,3,5,6-tetramethylbenzenethiolate to stabilize the $[Fe^{III}(Sr)_4]$ coordination unit has prompted them to reexamine the problem of $[Fe^{III}(SR)_4]^-$ complexes with less sterically hindered ligands. They report a new and general route to the synthesis of stable iron(III) tetrathiolate complexes. (16 refs.)

120606 Selective effects of homogeneous and heterogeneous reactions in the system N_2*-CO. O.Dessaux, P.Goudmand, B.Mutel (Lab. de Spectroscopie de la Reactivite Chimique, Univ. des Sci. et Tech. de Lille, Villeneuve D'Ascq, France).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.311-16 (Oct. 1983).
In the system N_2*-CO, effects arising only from the reactions in the homogeneous phase have been isolated in a reactor with inert walls. After an induction period of 0.13 s, they involve a stationary rate of enhancement of $N_2(B^3\Pi_g)$ and $N(^4S)$ concentrations according to the reactions $N_2(X^1\Sigma_g^+)_{v*}+CO\to CO(X^1\Sigma^+)_{v*}+N_2(X^1\Sigma_g^+)$ and $CO(X^1\Sigma^+)_{v*}+N_2(A^3\Sigma_u^+)\to N(^4S)+N(^4S)+CO(X^1\Sigma^+)$. In a reactor with active walls, both the above reactions in the homogeneous phase and heterogeneous reactions due to CO adsorbed on the walls are involved according to $CO_{ads}+N_2(X^1\Sigma_g^+)_{v*ads\ or\ not}\to CO(X^1\Sigma^+)_{v*}+N_2(X^1\Sigma_g^+)$ and $N(^4S)+N(^4S)+CO_{ads}\to N_2(X^1\Sigma_g^+)+CO(X^1\Sigma^+)N(^4S)+CO_{ads}\to N_2(X^1\Sigma_g^+)$-$+CO(X^1\Sigma^+)$. In this case, the rate of enhancement is not stationary. Furthermore, for cylindrical reactors with large diameters, the two types of reaction do not interact and their effects are additive. (7 refs.)

120607 Gas-phase equilibria of isotopic lithium systems. I. Pure lithium. Y.C.Chan, W.C.Stwalley (Depts. of Chem. & Phys., Univ. of Iowa, Iowa City, IA, USA).
J. Chem. Thermodyn. (GB), vol.15, no.10, p.989-93 (Oct. 1983).
The thermodynamic properties of the diatomic lithium molecules $^6Li_2$, $^6Li^7Li$, and $^7Li_2$ are calculated from the latest spectroscopic quantities. In addition, equilibrium constants for formation of these lithium molecules from their atoms are computed for temperatures to 2000K. (16 refs.)

120608 Gas-phase equilibria of isotopic lithium systems. II. Lithium and hydrogen. Y.C.Chan, W.C.Stwalley (Depts. of Chem. & Phys., Univ. of Iowa, Iowa City, IA, USA).
J. Chem. Thermodyn. (GB), vol.15, no.10, p.995-1000 (Oct. 1983).
For pt.I see ibid., vol.15, p.989 (1983). Gas-phase equilibria of the isotopic lithium and hydrogen systems are considered here. In addition to calculation of the equilibrium constants, the thermodynamic functions for the isotopic lithium hydride molecules ($^6Li^1H$, $^6Li^2H$, $^6Li^3H$, $^7Li^1H$, $^7Li^2H$, and $^7Li^3H$) are computed for temperatures to 2000K. (10 refs.)
